There was the same want of animation during the whole of the proceeding, if we except the luncheon time, that has marked the recent public sales of whitewoods. Upon commencing with the cargo of sawn pitch pine, per *Equator*, some time elapsed before a bid could be obtained; but by dint of pegging away and going over the catalogue two or three times rather more than one-half was sold. This being the case, there was no inducement to b ing forward the cargo per *Sarawak* from Darien. It was, however, hurried over, the oddments only being sold. Matters showed no improvement when the spruce deals were reached, lot after lot per *Andrew Jackson*, from St John, N. B, failing to elicit a bid, and the same fate was shared by the cargo in store per *Creedmoor*, of last season's shipment. from St. John's, N. B. The remainder of the cargo per *C. S. Parnell* was sold out to wind up the accounts, and this was about the only satisfactory item in the day's work. Birch timber was as dull as ever, 11d per foot only being bid for some St. John, N.B, birch, 14½ in deep. It is almost needless to say this was declined.

The following prices were realized :—

Ex *Equator*, from Pensacola.

Sawn pitch pine:—

Feet long.	In. deep.	Per c. ft. s, d.

LONDON.

The *Timber Trades Journal* of June 12th says:—There is a remarkable change in the character of the dock deliveries of timber goods this week. In fact, it almost takes one's breath away to see them rising over those of last year by 1,000 standards, where, for some time past they had been "toiling after them in vain," and always at least 500 or 600 standards per week behind. One only reason has been assigned for it: that it was the "Derby" week last year we are comparing with, which arrests our *Io Pæns* at an apparent spurt of lively trade to record. Nevertheless, the fact remains that the Surrey Commercial docks delivered last week about a thousand standards of sawn wood, &c., more than they did at the same period last year.

Trade remains exceedingly slack and shows no animation whatever, buyers around the coast exhibiting little interest to enter into further contracts, while London firms are restricting their purchases to the supply of the bare necessities of the moment. Importers are, moreover, naturally inclined to postpone the making of fresh engagements until the political horizon is clearer, as it is now very probable that a few weeks hence will find us in the midst of a general election, which must for a time completely disorganize trade. Anything, however, will be better for the country than a continuation of the unsettled state of things which we have lately experienced.

Messrs. Churchill & Sims' mahogany sale on Wednesday was well attended and prices seemed to vary considerably. This market generally may be described as presenting two remarkable features, viz., the extraordinary dearness of big sound logs, and the remarkable cheapness of the smaller descriptions. As a buyer remarked he never knew large table wood so dear, or the small wood so cheap. The cargo of cedar and hardwood ex Chandnagor from the Philippine Islands appeared to be a bad spec to the importer, judging from the poor prices it realized, several of the fancy woods, samples of which were handed around, were very heavy, and some amusement was created by a gentleman present remarking that the stuff would do very well for tombstones.

Messrs. Churchill & Sim had not an overflowing attendance to their sale on Wednesday. The catalogue was not a very large one, and, with the exception of the few pine lots and the flooring, was mostly composed of batten stuff. The bad prices obtained for the parcels of pine should be a warning to Quebec shippers against sending goods over here unsold. The regulars ex West Cumberland were really nice deals, and there must have been considerable loss on the orginal cost. The 7 to 10 inch went equally low, and altogether the result was far from satisfactory, and is certainly do encouragement to consign. At one time it was thought the stock of pine was unequal to the demand, but if any such illusions have existed the recent result of sales will dispel them. Stocks are quite sufficient, and anything like an attempt to press them would have disastrous results.

We have seen what forcing goods on an unwilling market has done in the way of lathwood. Not long since good fresh wood readily fetched under the hammer, £7 to £7 10s. now it has been sold as low as £5 10s., and Riga at 20s. less, really good wood. The defeat of the Government, which cannot help leading up to a general election, will have an unfavorable effect on business, and must interfere with trade in the provinces, especially in country districts, where these events have a far greater influence than in the larger cities.

If there were the slightest possibility of trade reviving we should recommend all our friends to come to London market and stock themselves with the cheap goods going; but, unfortunately, we cannot hold out much hopes of it. It was always the case that the public sale prices were under the cargo rates, but formerly the goods put up for absolute sale were picked over or inferior parcels, sea-damaged or something of that sort; but now we have cargoes hardly out of the ship clapped on the market, without any reservation, to go for what they can fetch; hence the amazing difference between the sale price and the c.i.f. quotations tells with double force.

Quebec, 25th June, 1886.

The Beginning of Consumption.

Blotches, pimples, erruptions, fever-sores ulcers and enlarged glans, are but so many manifestations of poisonous and scrofulous humors in the blood, which sooner or later are apt to attack the delicate tisssues of the lungs, causing ulceration and consumption of these organs Be wise in time and use Dr. Pierce's Golden Medical Discovery, the greatest blood-purifier, pectoral and strength-giver yet known to medical science. It cures all these dangerous maladies having their origin in the blood, if taken in time.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool, Birkenhead and Garston, on May 31th 1885 and 1886, and also the consumption for the month of May 1885 and 1886 :—

RAFTS ARRIVED.

The following rafts are reported in the *Chronicle* as having arrived at Quebec :—

June 10—R. H. Klock & Co., Ottawa River, white and red pine, etc., Cap Rouge.

John S. Murphy, Black Lake, pine and spruce deals, Black Lake Station.

June 15—Cook & Gibbons. waney white pine, ash and elm, New Liverpool Cove.

June 16—Collins' Bay Rafting and Timber Co., waney pine, etc., Bowen's Cove, Sillery.

June 17—Thomas Buck, white pine, ash, oak and elm, Belleville and Michigan, New Liverpool Cove.

A. Fraser, white and red pide, Ontario, St. Lawrence docks.

June 18—McArthur Bros., Michigan, staves, New London Cove.

June 19—McLachlin Bros, Bonnechere, red pine (2), Cap Rouge.

June 21—J. Burstall & Co., Ontario, oak, elm, ash, white pine, etc., Woodfield cove.

THE short supply of lumber this summer has greatly hampered building operation at Calgary, N. W. T.

A GREAT AND GROWING INDUSTRY.

The conversion of wood and straw into pulp, says the *Canadian Manufacturer*, and of that again into paper, has been prosecuted on an extensive scale for a number of years, and with great success. Still the most skilful practical managers of the business have had it forced upon their attention that the process, even on the most improved methods generally in use, lacks a good deal of being perfect, and they have been looking anxiously for that certain something to turn up, which would fill the long felt want, to use a rather hackneyed expression. It is now claimed that the identical "something" that fills the bill has been found at last in the Ritter-Cellner process, which is now being introduced into Canada, as appears by the following paragraphs from the *Paper Trade Review* (London, England) :—

Two Canadian paper and pulp makers have been in England for some weeks past, both of whom are associated with new enterprises. Mr. John A. Fisher, one of the visitors, whilst partner in the firm of John Fisher & Son, Dundas had a considerable experience in handling wood material and converting it into pulp by the soda process. This experience makes it an easier matter than it otherwise would have been for him to start a new mill on a sulphite system, the locality being Chatham, New Brunswick. He has chosen, as already stated in this journal, the Ritter Kellner process, the patent rights have been arranged with Mr. Kaindler (Everling and Kaindler, Paris,) and quite independent of the American Sulphite Co. and Syndicate. Mr. Kaindler is a paper manufacturer, and we believe a personal friend of Baron Ritton, hence the association. Mr. Fisher's new mill, unlike many mills in America, will be built of brick with slated roof, and if all goes well, it will be the first fully equipped Sulphite mill across the Atlantic. Mr. Mr. Fisher leaves on Saturday by the Cunard steamer Aurania. The other visitor—who left us on Thursday—is a partner in a pulp mill now being erected in Nova Scotia, and which we may refer to more fully at some future time. A small experimental plant, including three boilers, has already been shipped.

Mr. W. Friedlaender has returned from the continent, after visiting a number of pulp mills and concluding arrangements for several important agencies. He sends us samples of bleached sulphite pulp, produced in a German mill by the Ritter-Kellner process. They are remarkable for their purity of color and length of fibre. The pulp appears even more favorable than the samples by this process reviewed some months ago in these columns. Papermakers would do well to examine samples for themselves.

SEVERAL newspapers have taken up the incipient agitation in favor of placing an export duty on sawn lumber, arguing that such a tax would favor the manufacture of sashes, doors, etc., in Canada. These wise advisors of our legislators seem to forget that there is a United States duty on these articles, and that the placing of an export duty on sawn lumber would only result in the extinction of a valuable industry.

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

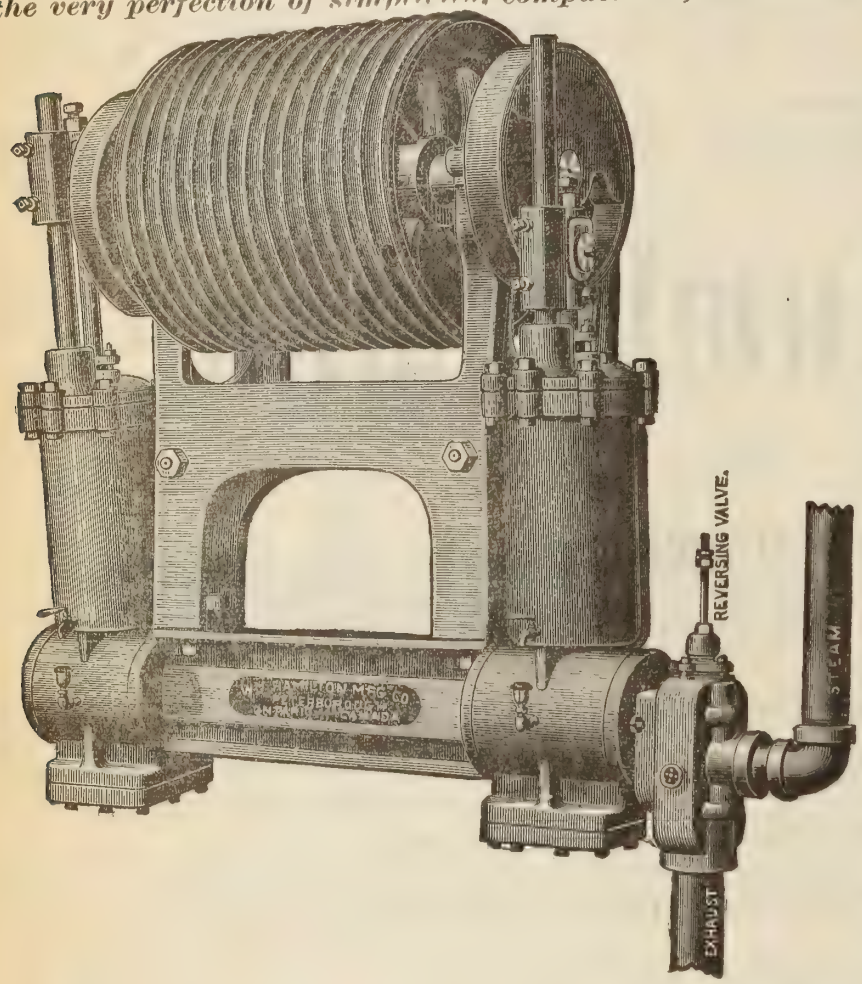
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———*CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM*———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, th advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞*We guarantee this to be the best Mill of his kind got up, and would ask any one wanting a good Band Saw Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacurers,*

COLONIAL EXHIBITION.

The following notes regarding the Indian and Colonial Exhibition, London, Eng., are taken from the London *Canadian Gazette* of June 10th :—

As is but natural, the agricultural trophy in the Canadian section continues to receive the special attention of visitors. "This is the best thing in the exhibition," is a sentence to be heard continually from their lips. The many questions asked of and fully answered by Mr. Cracknell further indicate the deep interest awakened, for the majority are not satisfied to look and pass on, but wish to be informed as to the locality and conditions of growth of the samples.

It is the hope of many that one result of the present meeting of Canadian and Australasian in friendly rivalry may be the creation of an interchange of commodities between their respective parts of the Empire. A step has already been taken in this direction by Messrs. Wallace, Warne & Co., of Western Australia. This firm, attracted by the excellence of the cheeses of Eastern Canada, have opened up negotiations with Mr. T. D. Millar, of Ingersoll, Ontario, for the importation of cheese from Canada to Australia, and that enterprising gentleman is now on his way to the Dominion to carry out the arrangement. There are many other commodities capable of taking part in a satisfactory intercolonial trade.

The Congress of Chambers of Commerce of the British Empire to be held at the exhibition on the 8th July, will, it is claimed, be the most important commercial congress ever held in any country. The parts of the Empire represented will be—Australasia with no less than 13 chambers, Canada with four, China, India, Indo-China, South Africa, with four, British Guiana, the West Indies with three, and the British chamber in Paris. The Canadian delegates will represent respectfully the Board of Trade of Toronto, Montreal, Quebec and Hamilton. It is to be regretted that Winnipeg and Victoria send no one to speak on their behalf.

The Leeds *Mercury* remarks :—"Pushing Canada comes out bravely with agricultural products, and with machinery and implements too, being singular in the latter display, as the other colonies do not show a score of implements between them."

The Edinburgh *Scotsman* compares the Canadian with the Indian section. "India beams forth in all its eastern splendor ; Canada comes to the front as a country capable of great things waiting for the development which capital and population can only supply."

FORESTRY CONTINUED.

The commercial aspect of Canada's forestry display at the exhibition is very obvious. Canadians are firmly convinced that the trade with Europe in the hardwoods of their eastern Provinces may be largely extended. For the soft woods there is always a sufficient local demand, and Canada is not in a position to compete with the Baltic lumber so far as the soft varieties are concerned. It is therefore the hardwoods of Canada that best adapt themselves to export. At present England imports her hardwoods in immense quantities from the United States, a large number of factories being devoted exclusively to this branch of the trade. There are, however, important indications that the United States supply is fast falling off. A considerable importation does already take place to the United States from New Brunswick, and from Western Ontario, in spite of the present duty, and an agitation is in progress in the States for the free importation of the lumber of Eastern Canada, to prevent the destruction of the forests of the great Republic. On the other hand the supply of eastern Canada is, in many respects, ample, Authorities even declare that there is no perceptible decrease, generally speaking, in that of New Brunswick for instance ; while the concontemplated railway from Rivere du Loup across to the St. John's river, will open up a large extent of country with very fertile soil though hitherto inaccessible. Thus, with extended effort on the part of the various Provincial Governments, no hindrance need arise in the development of the industry. The authorities of Nova Scotia have not found it necessary or desirable to do much at present in furtherance of this development of the industry. In Ontario a great part of the country is in the hands of the Provincial Government, but still the lumbermen have extentive limits, and husband the timber, cutting only a limited extent. The New Brunswick Government will shortly have the new districts under control, where ample maple, birch and pine are to be found, and they will, it is hoped, take every necessary measure for their proper use and preservation.

ENGLAND'S WOOD EMPORIUM.

Taking eastern Canada as a whole, there is therefore abundance of woods useful for manufactures—the three species of ash, two of elm, basswood, beech, three of maple, three of hickory, six or seven of oak, butternut, black walnut, buttonwood, three species of birch, and several others. And these are at present in extensive use in the manufactories of Canada. Among the Canadian exhibits—in agricultural and other implements, in machinery, in furniture, and in many other classes, nearly all these varieties may be seen in actual use. There Englishmen may realize for themselves what Canadian woods are capable of ; and pointing to these exhibits, Canadians naturally ask: What is to prevent England looking to us, as one of her colonies, rather than to the United States, not alone for her raw material, but for the manufactured goods we are equally able to supply ? In Quebec and Ontario alone, there are above sixty-five varieties of trees, of which more than four-fifths are in present use for manufactures in the country and for export. Here then is surely a good field for development, but many Canadians have themselves a lesson to learn. They must realize more fully that it is questionable prudence to cut down forests for the mere purpose of exporting the raw lumber. Indeed, in view of the immense importance from a climatic and general point of view of the forests to Canada, such a policy is unwise in the last degree. When land is being cleared for agricultural purposes, then export such lumber rather than burn it ; but Canadians must remember the great value in years to come of the vast timber areas now too often so lightly thought of. If proper steps be taken to preserve the forests, there will still be ample material to develop to a hitherto unknown extent the wooden manufactures of the country, and bring England and Europe to realize that Canada may be looked to for the supply of much of the manufactured goods now obtained from the United States. And on this point, too, Canadians must not forget that while sentimental feelings and artificial encouragement may do something to extend trade relations with England, future development must largely rest with their own enterprise and with their readiness to meet the full requirements of European markets.

As to the export forest trade of British Columbia, most competent authorities believe it to be but yet in its infancy. The chief woods of the Province that lend themselves to manufacture and export, are the red and yellow cedar, Douglas pine, white maple, oak, alder, and dogwood. Of these prominence must be given to the first three. They are invaluable to the Province, growing to an enormous size, and producing an immense amount of the very best of wood for the almost every purpose. Considerable exports already take place to Australia, South America, China, and other parts of the eastern world, for few woods can equal those of the Province for bridges, railway ties, frames and shipping accessories. But the past record is as nothing to what the future is destined to show, not only in the raw material, but also in the highly finished manufactures to which the natural conditions of the Province so readily lend themselves.

The *Gazette* of June 17th says :—Among the visitors to the Canadian section last week was a party of four farmers, formerly from the north of Ireland, and now settled near London, Ontario. They are now in England to take out a number of horses for agricultural work, the Canadian stock not being in their opinion at present so heavy and suitable for this purpose as English breeds. They report a very early spring in Ontario, and a generally forward state of growth. Fall wheat promises to be excellent this year, though they find raising cattle for export more profitable.

TIMBER ON THE PUBLIC DOMAIN.

The following order, issued by the land office in regard to cutting timber on the public domain took effect on the 1st inst. The order is issued in accordance with the act of June 3, 1878, authorizing the citizens of Colorado, Nevada and the Territories to cut and remove timber for mining purposes :

1. The act applies only to the States of Colorado and Nevada, and to the Territories of New Mexico, Arizona, Utah, Wyoming, Dakota, Idaho and Montana, and other mineral districts of the United States not specially provided for, and does not apply to the States of California and Oregon, not to the territory of Washington.

2. The land from which timber is felled or removed, under the provisions of this act, must be known to be strictly and distinctly mineral in character, and more valuable for mining than for timber, or for any other purpose or use.

3. No person who is not a resident citizen or or bona fide resident of the State, Territory or mineral district shall be permitted to fell or remove timber from lands therein.

4. Timber felled or removed shall be strictly limited to building, agricultural, mining and other domestic purposes. All cutting of such timber for sale or commerce is forbidden. But for building, agricultural, mining and other domestic purposes, each person authorized by the act may cut and remove for his or her own use, by himself or herself, or by his, her on their own personal agent or agents only.

5. No person shall be permitted to fell or remove any growing trees of any kind whatsoever less than eight inches in diameter.

6. Persons felling or removing timber from the public mineral lands of the United States must utilize all of each tree that can be profitably used, and must cut up and use the tops and brush or dispose of the same in such a manner as to prevent the spread of forest fires.

Unenforced Tariff Resolutions.

The following letter appeared in the Montreal *Star* :—

SIR,—Much has been said and written by learned men through the press about enforcing the export duty on logs and shingle bolts, but it appears to be all talk so far.

It's a pity our country has to suffer so severely by our Dominion Government allowing capital to bury itself and they walk to the funeral. They pass acts to protect our resources, and let us wait for the day of resurrection to unearth them to be enforced.

Yours, etc.,

P. D. BYRAM.

Madawaska, N. B., July 2nd, 1886.

Chips.

CUMMING'S saw mill at Birtle, N. W. T, has been damaged by fire.

THE Bay City *Lumberman's Gazette* has commenced its fifteenth year. It has adopted a wider column than formerly used. It gives every week considerable lumbering information.

THE *Monetary Times* says:—There was shipped last year from California to Australia 5,950,000 feet of redwood pine. Does not this help to point out the possibilities of Canadian trade on the Pacific Ocean when the line of steamers is running from the termination of the C. P. R.?

RAIN is much needed on the upper stretches of the St John river. There are, says the *Globe*, about twelve millions of logs hung up in the neighborhood of Eleven Islands. These belong principally to Mr. Walter Stevens. There is a solid body on the bed of the river and there is no trouble in crossing dry shod.

FIRE has been raging in the forest along the Zeland Valley railroad, N. H, owned by E. J. Henry. Three camps with two million feet of spruce and about two miles of track have been burned, also 2,000 cords of wood. Two mills were forced to shut down; damage $30,000.

ZEALAND, N. H., July 8.—Fire is raging in the forest along the Zeland Valley railway, owned by E. J. Henry. Three camps, with 2,000,000 feet of spruce, and about two miles of track, have been burned. Also 2,000 cords oi wood. Two mills have been forced to shut down Damage $30,000.

RYERSON, HILLS & Co and other parties last week sold to the Cohasset Lumber Com pany, of North Muskegon, about 30,000 000 feet of pine timber located in Newaygo and Lake counties. The timber will all be taken to Muskegon for manufacture.

THE new lumber rates from Chicago to points in Ohio, Indiana Michigan, Pennsylvania, West Virginia and Kentucky went into effect July 1st. The rates are on the basis of 10½ to Cincinnati, 13 to Cleveland, 12½ to Saginaw river points, 12½ to Louisville, 9 to Toledo.

T R LYON sold to Davis, Blacker & Co., of Manistee, recently, a group of pine near Luth er. town 19 11, estimated to cut 11,000 000 feet for $55,000 000 – just even $5 stumpage How can good lumber depreciate in value asks the *Lumberman's Gazette* when such prices are paid for timber in the woods

THE Kirby Carpenter Company, says the *Lumberman's Gazette* is now settled in its policy of piling lumb r at the mills at Menominee. Mich The yard at Chicago is being rapidly closed out of stock and none is being put in. Its year's cut of 60,000,000, or more, will be piled at the mill. The Ludington, Wells & Van Schaick company is pursuing a like policy

THE Duluth tells us that the lumber firms there report an increased demand for lumber outside of the city. The prospects in the early spring for a good trade looked dubious but within the last month business has improved and from all parts of Minnesota and Dakota orders are coming in for building material.

LUMBER manufacturers along the line of the Northern Pacific railroad held a conference in Duluth lately. Estimates made the amount of lumber on hand show 107,000,000 feet against 165,000,000 a year ago, and the log crop this year to be 231,000,000 against 172,000,000 last year. Lumbermen figure from these figures that there will be a lumber famine before the year is over. Prices on dimension stuff for places west of Brainard were made $1 over Duluth prices and common boards advanced $1. An effort will be made to establish uniformity of grades through the Northwest.—*Mississippi Valley Lumberman.*

SAYS the *Lumberman's Gazette* of Bay City:—"The CANADA LUMBERMAN informs the *Gazette* that the export duty on rough timber is $2 on pine and $1 on spruce, not $3 and $2 as this paper has stated. Glad to be put right" The first proposal was to place the duty at $3 and $2, and now the Government has authority from Parliament to raise the duty to those figures if it is found desirable. At present, however, the duty is $2 on pine and $1 on spruce.

THE LUMBERMAN'S OCCUPATION.

Bangor, once the greatest lumber market in the world, though doing a much smaller business than in Penobscot's palmy days, is still the home of expert loggers and drivers, and the headquarters for the most approved kinds of lumbermen's implements. Such is the fame of Bangor cant dogs and axes and batteaux that operators in the comparatively new logging regions of the west and far off Pacific slope send here for them. But is the men of the Penobscot who are principally sought, not for cutting the logs, for almost anybody can swing an axe, but for the perilous work of driving the logs through rapid waters and over roaring falls and swift rapids. Every spring, when the trees have been felled and when the warm sun has transformed frozen streams into rushing torrents, men from the Kennebec and Connecticut come to Bangor to hire crews who are handy with the axe and cant-dog, and who are not afraid to break a jam or sleep on the hard ground in a single blanket. They are especially anxious to get Bangor boys when they have a hard drive in propect, for they know that the Penobscot red-shirters will pull through if it is a possible thing.

Not many people understand how logs are driven from the wilds where they are cut so many miles to the great booms near the mills, where they are sawn into lumber. It is a peculiar and a hazardous work, and when a lot of drivers start away for the headwaters with their pike poles, cant-dogs and axes it is just as natural to expect that some of them never will come back alive as it would be in the case of a company of soldiers starting for a battle field. After the loggers get through dumping the logs over into the frozen streams but a brief period ensues before the snow and ice melt and carry the big spruce sticks in great masses down stream and create big jams, backing the water up so that many of the logs are floated over submerged flats, to be left high and dry when the first detachment of drivers break the jams and let the water loose Then the drivers' work begins he grounded logs in the upper country where horses can not be used must be carried to the streams by men and often it requires 20 strong drivers wading knee deep in mud, to carry a single stick to the water. The farmers whose meadows are thus strewn with logs often claim the timber as a recompense for the obstruction it causes to their operations and at times they appear with shotguns to prevent the drivers from carrying off the logs. But the boss driver orders his men to "bring that stuff down" and the "stuff" generally comes.

Several crews are employed on a drive of any considerable size or at the head or lower end, others along the line or at the rear. There are many rocks, rapids and falls where the moving mass is likely to jam, and these places must be carefully watched to prevent a general "hang ing up" of the logs. Sometimes one big stick caught on a rock will hold back hundreds of thousands of feet, and then some daring fellow is ordered out with an axe to chop away the obstruction. It is at the risk of his life. He must be quick, for at the last stroke of his axe the big log snaps asunder with a boom like that of a cannon, and then there is a tremendous stampede of all the logs behind it. If the driver is lucky and agile he gets ashore all right, leaping from log to log, but one misstep, or a little slowness is likely to precipitate him into the seething mass, and if it is ever found below, his body is mangled almost beyond recognition. Generally it is never found

As the drive progresses the men follow through to the woods or along the rocky, uneven shores after it, and "wangans," or commissary departments of the different gangs, going on before. The driver works as long as it is light enough to see a log, and the moon is bright they often go to work at 3 o'clock in the morning and continue until the last glimmer of twilight. They eat their plentiful but coarse evening meal and, wrapped in their blankets lie down to sleep. While they sleep, which seems to them but an hour, the "wangan" moves ahead five or six miles, and when they awake there is that distance to walk through the woods before breakfast.

I saw a Bangor man who had just returned from the Connecticut, where he had driven six weeks. Sundays included, for $2.50 a day, and he brought a sad story with him. After escaping several perils himself he had seen one of his camp mates go down to a cruel fate, while another was barely saved alive. These two, a Bangor boy and an old driver from St. John. N. B., had come up from the lower end of a drive, near North Stratford, Vt., to help break a big jam above. They walked through the woods to the point just above the jam and then started down stream for it on a log apiece. Before they knew they were in "white water" around some rocks; one log was lost and the two were clinging to the other. When they reached the jam the Bangor boy was crushed up against it, while the St. John man was swept under and lost beneath the wilderness of the logs. The young fellow, pinned by the big stick to which he clung, cried in vain for help, for the crew were out of hearing, and was just about to go under when another floating log struck his and swung it around in such a way as to liberate him. Then he managed to struggle ashore. and terribly injured was conveyed to the nearest house. River driving is a dangerous business, but there are plenty of men here ready to take its chance.—*Lumberman's Gazette.*

LOGS AND LUMBER.

THE Bay City, Mich., *Gazette* returns to the subject of the export duty and says:—"The Canadians ought to be able to see, if they cannot, that their export duty on saw logs and the American import duty on sawn lumber operate in about the same way to obstruct the sale of Canadian forest products in the United States," Oh, yes; the Canadians see that And they saw, too, that as they operate in about the same way, when the American import duty was double the export duty on logs the obstruction in the way of the sale of sawn lumber was twice as great as that in the way of the sale of logs, and their clear vision and common sense told them that such an arrangement would deplete their forests for the benefit of United States lumbermen, and to the disadvantage of Canadian manufacturers. They thought it much better to have even a smaller sale of timber, and to have more lumber sawn at their own side of he ine. they want the duties to be equal, either $2 or n 0

THE QUEBEC TRADERS.

The London, Eng., *Timber* of June 26th says:—The Hovding, Captain Beck which ship is known as the "Lightning Express" amongst the numerous timber ships that ply between the po t of Quebec and the United Kingdom, arrived in the Thames on Wednesday afternoon, having experienced the longest voyage since she has been in the Quebec trade. She went along at her usual speed until she arrived off St. Paul's, in the Gulf of St Lawrence, when she experienced strong northeast winds, and in consequence those vessels that sailed many days after her came up in the race, and several boats arrived in the Thames the same tide. She has a cargo of Quebec spruce deals consigned to Messrs. Bryant, Powis & Bryant, limited. Owing to neap tides she was unable to dock, and cannot do so until Tuesday or Wednesday next The Carin and Craigallion have also arrived from Quebec, and are now discharging in the Millwall docks on account of Messrs. R. R. Dobell & Co., as also the Clara, in the Surrey Commercial docks, for the same firm.

CLASSIFICATION OF LUMBER.

The Toronto *Globe* of July 9th says:—A meeting of general freight agents, respresenting the Canadian railways, and a special committee of the Toronto Board of Trade, representing the lumber interests of that body, was held at the Queen's hotel yesterday. The meeting had been called to adjust the differences which have been caused by the recent changes consequent on the adoption of a Weighing Association in Tor nto. There were present Messrs. John Porteous, general freight agent, A. White, John Earle, and A. Burns, district general freight agents, representing the Grand Trunk Railway; G. H. Bosworth, assistant freight traffic manager, E. Tiffin, general freight agent Ontario Division, and — Houston, Ottawa, representing the Canadian Pacific Railway; R. Quinn, general freight agent, and G. A. Mumford, assistant general freight agent, representing the Northern & Northwestern Railways; and E. A. Carter, representing the Bay of Quinte Navigation Company, and Messrs. Wm. Kerr, S C. Kanady, and H. H. Willmott, representing the Board of Trade. The questions at issue were fully discussed, and it was eventually decided to submit to the Board of Trade a proposition to accept the classification of the Canadian Freight Agents' Association, which gives a certain weight to green lumber, another to partially dry, and another to fully seasoned lumber. Each shipper will be required to certify to qualities and the seasoning of the lumber so that the rate can be arrived at. The representatives of the Board of Trade promised to submit the proposition to the Board, and the general expression of opinion was that the matter would be satisfactorily adjusted on this basis.

BUILDING IN NEW YORK.

The *Record and Guide*, of New York, states that the June returns show a larger business in buying of real estate and building, than did the corresponding month last year. There were during June 1,244 conveyances of property, or 230 more transactions than for the corresponding month of last year. There was also an increase of investment amounting to $500.000. Plans fo building were filed to the number of 495, to cost $6,732,755, against 320 plans in June last year, costing $5,151,425. Our authority concludes from this showing that the effect of the May strikes was not so serious as many had supposed. For six months, ending July 1, building operations in New York called for an expenditure of $37,500.000 On this basis it is estimated that about $75,000.000 will be expended for new buildings in New York the present year, against $44,000,000 last year. In Brooklyn, however, building shows a falling off, as compared to last year. In the first six months of 1885 2,036 new structures were projected, calling for an outlay of $10,567 022 This year plans filed were for but 1,878 buildings, to cost $9,267,417.

Horsford's Acid Phosphate—Unanimous Approval of Medical Staff.

Dr. T. G. COMSTOCK, Physician at Good Samaritan Hospital, St. Louis, Mo., says: "For years we have used it in this hospital in dyspepsia and nervous diseases, and as a drink during the decline and in the convalescence of lingering fevers. It has the unanimous approval of our medical staff."

For "worn-out," "run-down," debilitated school teachers, milliners, seamstresses, housekeepers, and over-worked women generally, Dr. Pierce's Favorite Prescription is the best of all restorative tonics. It is not a "Cure-all," but admirably fulfills a singleness of purpose, being a most potent Specific for all those Chronic Weaknesses and Diseases peculiar to women. It is a powerful, general as well as uterine, tonic and nervine, and imparts vigor and strength to the whole system. It promptly cures weakness of stomach, indigestion, bloating, weak back, nervous prostration, debility and sleeplessness, in either sex. Favorite Prescription is sold by druggists under our positive guarantee. See wrapper around bottle. **Price $1.00, or six bottles for $5.00.**

A large treatise on Diseases of Women, profusely illustrated with colored plates and numerous wood-cuts, sent for 10 cents in stamps. Address, WORLD'S DISPENSARY MEDICAL ASSOCIATION, 663 Main Street, Buffalo, N. Y.

SICK HEADACHE, Bilious Headache, and Constipation, promptly cured by Dr. Pierce's Pellets, 25c. a vial, by druggists.

Dont Be Deceived.

Beware of any druggist who will try to induce you to take anything in place of McGregor & Parke's Carbolic Cerate. It is a marvel of healing for Sores, Cuts, Burns, etc. No family should be without it. It has no equal. Get McGregor & Parke's, and have no other. Only 25 cents per box at John McKee's

Fluid Lightning.

All sufferers from that terrible torment, Neuralgia, can be made happy in one moment by a single application of Fluid Lightning briskly rubbed on the painful parts, and without using any disgusting medicine day after day with little or no result. Fluid Lightning also cures as effectually toothache, lumbago, rheumatism, headache, and is only 25 cents per bottle at John McKee's drug store.

A Sensation.

An unparalled sensation is being created all over Ontario by the wonderful and unequalled manner in which neuralgia, toothache, rheumatism, backache, headache, etc., is removed by but one application of Fluid Lightning. No offensive, disgusting drugs need be taken for days. It is an instant cure. Try a 25 cent bottle from John McKee, Druggist.

AUSTRALIAN FORESTS.

In South Australia, as in other Australasian Colonies, they have wisely adopted a system of scientific forestry, giving much attention to the conservation of existing forests and the formation of new plantations. Large tracts have been reserved for fo ests.

From the South Australian *Advertiser* we take the following extracts from a report of a visit by Ministers and members of the Legislature to some of the forest reserves:—

SOUTH AUSTRALIAN FORESTS.

Not long after Mr Brown's arrival in South Australia the Forest Board was abolished and the department placed under the Commissioner of Crown Lands, with Mr. Brown at its head, Mr. Melville retaining his position as secretary. From that time to the present the work has made steady and valuable progress, as the following figures will prove:—At the present time there are 139 595 acres of country devoted to forest purposes in this colony, independently of reserves on the Murray Flatt, the area s of which have not yet been declared On June 30th, 1885, there were in the northern district the Bundaleer, Wirrabara, Mount Remarkable, Penwortham, and Mount Browne forests, 89,769 acres. Central district—Port road reserve, and Goolwa forest, 203 acres Western district—Wallaroo forest, 4,174 acres. Southern district—Mount Gambier, Mount Burr, Mount Muirhead, Glenroy Flat, Mundulla, Bordertown, Cave Range, Penola, and Mount McIntyre forests, 45,449 acres. In these various localities the total of lands enclosed for planting amounted to 5,727½ acres, which area has been increased since the conservator made his last annual report. Since the organization of the forest department in 1876 the total revenue to June 30th, 1885, shows £50,919 12s 9d; total expenditure do. do., £52,752 8s 8d; revenue last year, £6,202 14s 5d; expenditure last year, £6,028 18s 4d; total number of trees alive from last year's operations, 162,000; total number of trees alive from the planting operations since 1876, 1,200,000; raised by conservation in indigenous forests, 600,000; number of trees reported to be alive of those given away to landowners, 400,000; probable revenue over expenditure this year, £1.200; estimated value of plantations at the end of present year, £130,000. These are figures which speak for themselves, and no doubt when they are presented to Parliament they will occasion close scrutiny, and obtain for the conservator a large meed of commendation. But as to the actual value of the forest and of its real importance to the State, members of Parliament generally have but very vague notion. It is only by a visit and personal inspection that they can form anything like an adquate idea of the work that has been done in connection with the nurseries and plantations. Protecting the natural-grown timber is a matter that could be done to some extent by regulations from the department with officers to carry them into effect, but it is in the nurseries and plantations where the skill of the scientific forester is shown, and upon what is done here depends our forests of the future.

TREE PLANTING AT JAMESTOWN.

The visitor who may have known Jamestown a few years ago would fail to recognize its once open and dusty streets in the umbrageous and pleasing aspect they now present. Tree-planting has been very largely indulged in by the corporation, to whom the young trees were furnished gratuitously by the Forest Department. The enclosures down the centre of the main street, the public reserves, and the sides of the creek all display a very neat growth of forest timber. There are no less than 75,000 forest trees at Jamestown within the corporation plantations, and though their value a few years hence will represent a considerable sum of money, their cost to the Government at the time they were presented to the corporation would not be more than one half penny each. Jamestown is blessed with a stream of water which runs all the year round and a nice sheet is formed between the railway station and the township where the creek has been dammed back. Forest trees, however, are not dependent on irrigation. If the young plants have been properly reared, and are put in the ground in avenues, or 8 or 10 feet apart at the proper time of year, they will flourish and do well, this being exemplified in the healthy appearance of the trees after the present long dry summer. The owners of various farms around Jamestown have also availed themselves of the chance of procuring plants from the department, and Mr. Brown sets as much value to the country in the dissemination of these plants as he does in rearing them in the forest. He contends that the benefits will be almost incalcuable if farmers as a body will plant groves or avenues or rows of trees about their farms In addition to the protection from the weather which it affords to their stock the rainfall will be increased and become more general than at present. The showers will be less tropical in their character, and consequently the effects of the rainfall will be more lasting. There are dozens of farmers and private people in the Jamestown district who have planted the Eucalyptus globulus (Tasmanian bluegum), and the Eucalyptus corynocalyx (sugar gum), which are the two hardiest and best known of their species. One farmer, Mr. Mitchell, has 10 000 trees on his estate, Mr. Crane has a similar number, Mr. Neil about 5.000, and altogether, within a radius of seven or eight miles of the township, there are now 100,000 trees growing, where formerly there was scarcely a tree visible in the landscape. Although the original settlers in the areas were glad to find the country so bare that no clearing was needed before they put the plough in the land, they have since discovered that timber is needed, at least for fencing and firewood, and for various purposes in connection with the working of a farm. By-and-bye too they will be able to supply the larger timber to railway contractors and others, just as the department is doing now, and thus will realise a substantial profit from their treegrowing.

BUNDALEE FORESTS

Stretching away for miles on either hand nothing but a bare, dead-looking country, with perhaps here and there a ploughed paddock, or bits of straggling scrub, met the eve after the visitors had turned their back upon Jamestown till approaching Mount Robertson in the hundred of Belalie, and on the east of Yangya to the north of Mount Campbell they descried the forest of Bunda'eer in the distance. Situated at the foot of a long chain of ranges the reserve includes various descriptions of soil from rich black alluvial in the swamps to brown and red sandy loam, very rich chocolate, and other varieties in the bottom lands and around the ironstone and limestone ridges. Gravel beds, slate reefs, sandstone, and rough rocks abound on the higher elevations, through which watercourses find their way to the creek which runs from the north through the main part of the forest to the southeastern boundary. The site is 1,800 feet above sea level, and the rainfall last year was 23 inches spread over 57 days. The area of this reserve was 22,000 acres; area planted, 2,300 acres; number of trees planted last year, 146,298; number of these now alive 106,000; revenue in 1884-5, £2,834 8s 7d; expenditure in 1884-5, £1.548 11s 6d; total number of trees alive from the planting since commencement in 1876 about 600,000; total revenue since 1876, £25,731 19s 10d; total expenditure since 1876. £17,211 8s 7d. The reserve is divided into plantations A B C D E F G, where according to the soil the various kinds of trees are placed. Plantation F for example is devoted to Eucalyptus globulus; E. corynocalyx, E viminalis. Pinus insignis, P. pinaster, auracaria excelsa, cupressus sempervirens and Abtres douglasii. In plantation G there are gums only, viz., three kinds named above, and in addition the Eucalyptus rostrata, E gunnii, leucoxylon, and gomphocephala. In the nurseries on this reserve there are now about half a million plants and the following are the popular names of the different varieties: Sugar gum, Tasmania bule gum, manna gum, white swamp gum, red gum, South Australian blue gum, tooart gum of Western Australia, English oak, remarkable pine, maritime pine, Aleppo pine, the bunya bunya, Indian cedar, pepper tree, white mulberry, white cedar, tamarisk tree weeping willow sycamore, cork elm, English elm American white ash, upright poplar, seedling olives, common erect cypress, American catalpa tree, and Canadian maple. As the party approached the forest they gave vent to exclamations of surprise and admiration at the 75 000 Tasmanian blue gums which extended on their right hand for miles along the road at an average height of 40 feet in rows about 10 feet apart. This vigorous picture of life and beauty formed a marked contrast to the barren plain on the left, which extended as far as the eye could see; and when on nearing the forest cottage the Pinus insignis, with its deeper green foliage, was met with, standing in equal rows to the height of twenty feet and many thousands in number, there were more ejaculations of astonishment and gratification Undoubtedly the legislators who had heard and read of the forest operations had litttle or no idea of what was meant by them. The blue-gums, to which we have referred, were planted nine years ago, and are now of a size nine inches through, fit to be cut for telegraph poles. This season 5.000 will be cut for this purpose, representing 10s. each to the Telegraph Department. This is merely a thinning out process which will take place each season to allow room for the growth of larger timber, which in time to come will furnish the colony with railway sleepers. It takes nearly 30 years to bring a gum tree to perfection, but the pines mature in about 20 years and then furnish deals for building purposes. Of this tree there is a very number thriving wonderfully well, and of 30,000 planted open root (like cabbages) 98 per cent. are surviving. The Tasmanian gums planted in the same manner thrive nearly as well, as also the sugar gum, but most other varieties are planted out in bamboos. Over 43,000 of the latter are alive and thriving out of 45,000 planted out last season. Some years ago it was supposed that pines must be planted out in pots, but here there is ocular proof to the contrary. Four year old pines raised from seed reach 16 feet in height, and the Tasmanian gum 20 feet in the same period. The visitors left their vehicles at the forest cottage, and under the guidance of Mr. Brown climbed the hillsides, where three hundred acres enclosed two years ago now carry 90,000 young gums, and 150 acres were shown that last season was ploughed eight inches deep, and planted half with pines and half with sugar gums. Of these 97 per cent. are doing well, notwithstanding the very dry season, and are now eighteen inches and two feet in height.

WIRRABARA FOREST RESERVES.

The latest figures at our command up to June 30th of last year give:—The area of this reserve, 48,600 acres; area planted, 450 acres; number of trees planted last year, 43,640; number of these now alive, 35,000; revenue in 1884-5, £1,925 11s 2d; expenditure in 1884-5, £1,450 1s 5d; total number of trees alive from the planting since commencement in 1876, 250,000; total revenue since 1876, £15.697 12s 9d; total expenditure since 1876. £12,690 16s 3d; total number of trees raised in natural forest and pruned since 1876, 500 000. To these figures must be added the planting, etc., which have taken place during the present season which will show a vast increase on the above, and which will be placed before parliament when the time comes around for the conservator to present his yearly report. Within the forest there are six saw mills in full work, and a number of sawpits cutting sleepers for the Silverton railway. A halt was made en route at one of these mills where the Commissioner of Public Works officially inspected the sleepers that were being cut, and was very well satisfied with their quality. They are of redgum and sugargum, both close grained substantial timber. The railroad authorities are very strict in respect to these, and rejected some 15,000 which were not considered worthy, but these will certainly be useful for other purposes. Mr Brown in his last annual report says:—"Hitherto the sleepers for our northern railways have been procured chiefly from Western Australia and Victoria, notwithstanding thas large quantities of useful timber were available in the forest under review. Owing, however, to the searching enquiries made by the late Commissioner of Public Works (the Hon. T. Playford) in regard to the lasting qualities of the respective timbers, it was decided to make use of the Wirrabara timber as far as possible for the Silverton railway. In consequence of this decision the number of sleepers referred to are now being contracted for in this forest. Messrs. Moorhouse & Jesser, of Laura, the successful tenderers, being under agreement with the department, the above named contractors have engaged to take the required number of sleepers, or as many of these as the forest will provide, at the rate of 4d per sleeper, upon the understanding that all the waste timber left in the forest and at the saw mills, in connection with their production, remains the property of the department. The contractors have erected two powerful mills, and engaged the service of another saw mill plant which was in the forest previous to their contract. Should the 200,000 sleepers be procured from the forest, a sum of £3,333 odd will accrue to the department therefrom. This does not include the waste timber, of which there will be a very considerable quantity, and from the sale of which a sum of at least £200 may be looked for. Apart altogether from the revenue which will be derived from the sale of these sleepers, the removal of the old matured trees will be of incalculable benefit to the forest as a whole. There is a very large number of matured trees in this forest which are now only incumbering the ground, and their removal is advisable not only in order to utilize the timber at its best stage, but also to make room for a younger crop of trees, so that a regular rotation of timber may be available from the reserve. By doing this and encouraging the natural growth by systematic conservation, the output capabilities of the forest may in time be made to yield a regular and permanent supply of valuable timber both for the maintenance of our public works and the requirements of the surrounding country. In order to increase the lasting capabilities of the sleepers it is specially contracted that no trees will be felled whilst they are in full sap. By adhering to this most desirable condition it is estimated that from three to four years will be added to the durability of the sleepers. A large number of trees having been rung during the dormant period of the sap, the cutting and hauling of these to the mills will thus be carried on at all seasons without detriment to the timber." Messrs. Moorhouse & Jesser have already supplied or stacked at the Laura station 170,000 out of the 200,000 required for the Silverton line. Other contracts besides that for Silverton are also being in progress of fulfilment. There is ample material in the forest for works of this nature, as the area extends for thirty miles, with an average breadth of six miles at the foot of the Flindert Ranges. Of the trees planted in this forest 250,000 are now alive and doing well, and these consist mostly of Pinus insignis, American and English walnuts, American catalpa, Canadian maple, cork, English elms, and the sugar gum. The grazing rents in this reserve last year amounted to £1 344. Shortly after two o'clock the party arrived at head quarters in the forest, and after dusting down partook of a relishable luncheon laid within a grove of young English ash trees at the foot of the garden belonging to the Areas Garden Company. This is a lovely spot where the natural attractions have been added to by the careful industry of the skilled horticulturist and gardener, as beautiful flower-beds, fruit trees, and all kinds of vegetables are to be seen there in the highest state of culture. Some speechifying was indulged in at the luncheon, when well-deserved compliments were paid to the Commissioner of Crown Lands for organizing the trip, to Mr. Krichauff for his early efforts in the direction of forest culture, and to the conservator, Mr. Brown, for his marked ability, skill and energy in bringing the plantations and reserves to their present state of perfection. The distance to be travelled to reach Laura before dark and the dangerous state of the roads prevented more than a causual glance being taken of the wattle and pine plantations and the nurseries at Wirrabara, but sufficient was seen to impress everyone present with the practical results that have been already achieved, and the great importance of forest reserve work as a lasting and remunerative national industry.

40,000 saw-logs belonging to the Gilmour Company have been abandoned at Partridge Creek, owing to low water.

Chips.

THE Midland *Free Press* says there is not quarter enough dock room for handling the lumber that is arriving at that place for re-shipping by rail.

THE Montreal *Star* says:—"An immense raft containing 400,000 feet of lumber, principally pine and oak, arrived off the city on Saturday night from Calvin & Son's lumber depot at Garden island, near Kingston. The agent, Mr. Guerin, and the thirty men employed on the raft, are staying at the London house. The journey was a very quick one, the distance being covered in four days. At every rapid different men are utilized; the Coteau rapid is considered the most difficult one, especially with a high wind. Last year the firm sent about 8,000,000 feet of lumber in 16 rafts. The other lumber company on the river is the Collinsby company. Although the journey is difficult and dangerous not a man has been lost for five years."

MR. PRINCE, manager of Eau Claire Lumber Company, arrived in Calgary, N. W. T., last Sunday, says the *Tribune*, and has already begun preparations for building a mill 32x100, with a capacity of 50,000 feet of lumber, 15,000 shingles and 15,000 feet of lath per day. The site is on the Bow river, near the corner of section 16. A dam about 15 rods in length will be thrown across the arm of the river between the main land and an island in the river. A wing dam about fifty rods in length will be constructed along the island to prevent the logs stranding. Mr. Price expects to have the mill ready about the middle of October. A gang of men have been sent to the mountains to take out timber, etc, which will be brought down by train. About 50 men will be employed and Mr Prince expects to be able to supply the Calgary market with lumber and wood at right prices.

Walnut in British Columbia.

The New Westminster *British Columbia* says:—Some time ago we called the attention of our readers to the question of growing walnut trees in this country. The subject is one that ought to be decided by a practicle test, as it is of very great public interest If walnut can be successfully grown, it would prove to be a source of immense wealth to the country. On this coast growth is very much more rapid than in the east, because the growing seasons are so much longer. The supply of black walnut is every year be oming less, and it will soon be wholly exhausted unless steps are taken to increase it by artificial means. It is estimated that in 10 or 12 years a walnut farm would begin to make returns in the shape of nuts, and in 25 years the timber would be worth a great deal. The rich flats in the valley of the Fraser ought to produce magnificent walnut trees.

Serious Fire.

WINNIPEG, Man., June 9.—A serious fire occurred at Rat Portage to-day, whereby the chief portion of the town has been destroyed. About 1 o'clock this morning fire was seen issuing from the Rideout House, at present unoccupied. It spread rapidly, consuming in in course the Hudson Bay store, S. W. Humble's liquor store, D. L. Ferguson's jewellery store, Gore's Hall, Drewry's hotel, and other buildings were seriously damaged. The total loss is estimated at $75,000. The fire is supposed to be the work of an incendiary. This is the third time the town has been seriously injured by fire during the past few years.

Socrate's Spouse.

Who knows what excuse there may have been for Xantippi's sad temper? Many women are snappish, querulous and sour simply because they are suffering. Dr. Pierce's "Favorite Prescription" is a certain cure for every feminine weakness and derangement, and will restore health and good spirits to the most nervous and disheartened invalid, thereby making her a blessing to her family and the world. A single bottle will prove its surpassing merit. Price reduced to one dollar. By druggists.

FROM ALL OVER.

A girl baby was born in Knowlton, Que., recently with four teeth.

Reports from the locality of the Keppel tragedy are not satisfactory. Hen roosts are being robbed by wholesale. Farmers are concerned for the safety of their property, and many suspicious characters infest the neighborhood.

If any of our readers that are afflicted with rheumatism have never tried West's World's Wonder or Family Liniment, we advise them to do so at once, and be convinced of its extraordinary merits. It is a never-failing remedy for cuts, sprains, bruises and all complaints requiring external treatment. Price 25 cents and 50 cents per bottle. Sold by J. D. Tully.

The programme for the International Sangerfest at Berlin, August 11, 12 and 13, has been issued and includes an interestiug series of musical and other events. Haydn's "Creation" will be given by 650 voices. The principal soloists will be Mrs. Caldwell, Mr. Jenkins and Mr. Warrington.

For the past quarter of a century West's Cough Syrup has given relief to thousands, and no medicine compound can show such a vast number of unsolicited testimonials. Ask your neighbor as to its merits. It is an unfailing cure for coughs, colds, hoarseness, asthma, bronchitis, consumption in its early stages, and all throat and lung diseases. Price 25c. 50c. and $1.00 per bottle. Sold by J. D. Tully.

Mrs. Agnew, of Tara, has two adopted children, a boy and a girl, aged ten and four years respectively. For some time Mr. Agnew has kept a gun in his barn, loaded with a small charge, for rats. On Sunday last the children were playing in the barn, and the boy picked up the gun and asked the little girl to stand off a piece until he tried if he could shoot her. She complied, and he fired and lodged two grains of shot in her face and several others in her left shoulder. The child was not seriously injured.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure. the majority of cases being cured by one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y22.

CAREFUL--COMFORTING

EPP'S COCOA.

BREAKFAST

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack us wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water and milk. Sold only in packets by Grocers, labelled thus:

PETERBOROUGH, Ont., JULY 15, 1886.

ONTARIO FORESTRY REPORT.

THE annual forestry report of Mr. R. W. Phipps to the Ontario Government is now before us, and it shows that Mr. Phipps is active and zealous as ever in his conduct of the Forestry branch of the Agricultural Department. His report conveys much useful information which should be attentively studied, and his suggestions are worthy of adoption before it is too late.

The most important improvement recorded for the past year was the establishment of a staff of over forty, at the joint expense of the lumbermen and the Government, for the purpose of preventing fires and enforcing the Fire Act.

The effort made to arouse public opinion on the necessity of taking steps to conserve our existing forests and to form new plantations where required, cannot be said as yet to have had much practical effect, though much has evidently been done already to open people's eyes, and there is some encouragement to continue in this course of education.

With this view Mr. Phipps still persevers in this report as elsewhere. He again urges the benefit of keeping a part of the land in forests, the moisture supplied in dry seasons, the protection from inundations and the shelter afforded to the crops in winter, both by retaining the snow and warding off cold blasts. The money value of plantations is fully pointed out, information being supplied from various sources, from trips taken by Mr. Phipps himself in several States, reports from other States and details of accounts of the pecuniary results in the mother country. It shows conclusively that plantations can be formed and managed very cheaply, as compared with the satisfactory results obtained.

As to the conservation of our existing forests, though some advance has been made, it is very certain that public opinion has yet to be aroused on this important subject. The interesting report from the State of Maine, under very similar circumstances to those prevailing in a large portion of our own country, shows how easily a great improvement on our present system may be made, even before the time arrives when Canada will be prepared to adopt scientific forestry as practised in Germany, France and other European countries and some British colonies.

Mr. Phipps adds to the value of his report by an almost complete list of our forest trees, with descriptions, use, habitat, &c. There is also an estimate of the pine timber remaining in each of the States, a useful glossary of scientific terms, and that rare and welcome aid to utilizing the information supplied, a very full index.

We have reserved to the last some consideration of the most important subject of all. Mr. Phipps deals with the question of establishing forest reserves, but the restricted territory to which he refers, shows how sadly the field is already circumscribed and how very soon it will be too late to adopt this wise system. It is not a matter that will permit delay. Quebec sets Ontario a good example in this respect, having made provision for extensive forest reserves, where the land is better fitted for arboriculture and perpetual forests than for agriculture. What bad economy it is to attempt to unite the two may be gathered from many an incidental passage in this report. Burnt timber and poor farms seem to be the result of the combination. In Australia they are now establishing enormous forest reserves with fairest promise; yet, we remain lethargic though it will soon be too late. If Mr. Phipps could succeed in persuading his department to introduce such a system he would add immensely to the value of his already great public services.

THE TRADE OF LONDON.

The aspect of the Surrey Commercial Docks this week appears unchanged, very few vessels discharging from the quays, and those out in the stream, overside into lighters, are mostly firewood ships with cargoes of ends, &c., in which there still seems to be something doing. These and the pitch pine cargoes form the chief of the arrivals the past few weeks. There is no plainer sign of trade depression than the dock deliveries, and these, so far from improving, are getting less and less as the season rolls on.

We are not comparing them with last year's, but even if we did the advantage recorded last week over the corresponding week of 1885 is not maintained, the record in the present number giving 1885 the advantage on deals of 383 standards; and though less flooring went into consumption by 36 standards, the delivery of ponded timber for 1885 exceeded last week by 531 loads; this difference, however, might probably be traceable to Whit-Monday. There is also a considerable quantity of goods being delivered outside of the docks, of which the only record to be found is in our import column. A large well-known firm in Lambeth have just completed taking their third cargo overside, and this, of course, becomes an important factor in the apparent falling off in the deliveries.

Freights, we are all aware, have reached a pitch at which it will not pay to keep steamer's fires going, but bad as these rates are, if they could be readily secured, owners might yet keep their vessels at work; but there is no certainty of obtaining charters, and steamers have often to rove from place to place in search of cargoes, eating themselves up with expenses, with very little prospect of making up the loss. We chronicled a vessel at Petersburg, which had been lying there some time, going all the way to Gefle to accept a cargo for London at 19s. This state of things seems at length to have become intolerable, and amongst those disinclined to work at a loss is the Bedale, and as soon as she has completed her discharge, she will, we are informed, be laid up till better times.

Another vessel lying up, that not long since brought a cargo, is the steamer Hollamshire, and we hear of numbers of others also being taken out of employment. Though very self-sacrificing on the part of the owners, we fear that it will not effect any material alteration in tonnage, the ships wanted being very disproportionate to the amount of unfixed tonnage still afloat. Sailing ships, we hear also, are being taken out of work, owing to the little there is for them to do, and those which are looking for employment apparently are not anxious to accept the present low rates to the pitch pine ports. These latter places are certainly not liked by the generalty of wood traders, the delays taking all the profit of the voyage. Profit at the present quotations seems almost farcical, but there must be something got out of the charters, or else the ships could not trade to such remote ports.

We notice one of the early arrivals from Archangel, the SS Pickwick, with a cargo of Russanoff's deals, for Messrs. Simson & Mason is at the Centre Yard quay, but she seemed all alone in her glory. The flooring seems to be moving off rather more freely, and we observed several waggon loads of prepared stuff being loaded. In the stave yard sheds, Nos. 10 and 11, is a cargo marked FB, FxB, and F—B, from Porsgrund. These are Messrs. Franklin & Baker's manufacture, and the first cargo of boards they have shipped. The white seemed to us to be very good, and looked quite equal to Dram. Both the 1st and 2nd were well made and clean. In the red we saw nothing specially to comment upon, though here again there was not much room for fault-finding. If the class of shipment of which these form a sample is maintained, the marks are likely to become favorites with the London trade.

Among the cargoes that took our special notice coming on to the quay, were the planks ex Stratford, to which we referred in our last. These seemed to be about the best pitch pine planks that we have seen for some time. Remarkably clean, a total absence of wane, no knots, particularly free from centres, and rich in colour; the cargo was evidently a selected one, and in splendid condition. These goods, we understand, were the shipment of Sullivan, of Pensacola.

The absence of freshly piled goods is still a noticeable feature in the docks, most of the stocks having last year's bloom on them, and from the dock offices right away down to centre yard only one bright pile is observable, a thing without precedent, and at this season of the year quite unknown in the history of the docks. Like everything else, the present evil state of trade will work its own cure, and sooner or later an improvement must come.

The tonnage taken out of the market, the lessened production at the loading places, with the large increase in the colonial trade, will afford chance of working off a good deal of the present burdensome stock, and bring the demand rather more in proportion to the supply; but when will all this culminate? that is the the question. While the remedy is in operation trade still remains prostrate, and the convalescence, we fear, will be very gradual when the recovery sets in.

It seems an anomaly all these new enterprises while the trade of the nation is falling off, and it is a problem difficult of solution, how it comes about that new docks on a gigantic scale are built, while those that have the advantage of locality and priority find their profits daily diminishing through loss of trade. What to do with the big docks recently completed, and which were to be such an immense boon to the port, is likely to become the next question.

There is one use they may be turned to that will save the reproach of having wasted the money expended in their construction, and for which they are very suitable, make them into a great naval dock. Expecting them to be filled with shipping while on all sides vessels are being laid up for want of employment, is hanging to a straw; like many other big speculations that were undertaken too soon, they must pay the penalty.

Last year was notably a bad one for trade, but the import was much better maintained than appears to be likely this season. Buyers were more plentiful, and trade in a much more settled state. The bad feature of the present time is the great want of confidence that pervades the community, and for which there is, unfortunately, too much foundation.— *Timber Trades Journal.*

THE Rathbun Company have purchased more wharf property in Oswego. They have storage room now for 15,000,000 feet of lumber.

PEOPLE WHO LIVE IN TREES.

We read wonderful stories of the immense trees one sees in California, but they sink into insignificance beside the Baobab tree, which I found in many parts of Western Africa, principally just south of the desert of Sahara. It is not distinguished for its extraordinary height, which rarely reaches over one hundred feet, but it is the most imposing and magnificent of African trees; many, it is said, are over one hundred feet in circumference, rising like a dwarf tower from twenty to thirty feet, and then throwing out branches like a miniature forest to a distance of one hundred feet, the extremities of the branches bending toward the ground. The botanical name of the curious tree in Adansonia digitata. The first in honour of its discoverer, Adanson, and the second, descriptive of its five parted leaf. The leaves are large, abundant and of a dark green colour divided into five radiating lanceolate leaflets. The flowers are large and white, hanging to peduncles of a yard in length which form a striking contrast to the leaves. The fruit is a soft, pulpy, dry substance about the size of a citron, inclosed in a long green pod the pulp between the seeds tastes like cream of tartar, and this pulp, as well as the pressed juice from the leaves, is used by the native Africans for flavouring their food. The juice is greatly relished as a beverage, and is considered a remedy in putrid fevers and many other diseases.

The Baobab is said to obtain a much greater age than any other tree, thousands of years being hazarded as the term of life of some specimens. It has extraordinary vitality; the bark which is regularly stripped off to be made into ropes, nets for fishing, trapping and native clothing, speedily grow again. No external injury not even fire, can destroy it from without; nor can it be hurt from within, as specimens have been found in full splendour, with the inside of of the trunk hollowed out into a chamber which could hold a score of people. One-half of the trunk may be cut or burned away—even the tree may be cut down, and while lying on the ground so long as there is the slightest connection with the roots it will grow and yield fruit. It dies from a very peculiar disease—a softening of its woody structure, and it falls by its own weight, a mass of ruins. The native villages are generally built around one of these immense trees, and under its far spreading branches, which form an agreeable shelter from the sun, is the Kotla, or place of assemblage, where all the public business of the tribe is transacted. The circuit described by the extremities of the lowermost range of branches is fenced around, so that none but those privileged to attend these meetings can intrude. In thinly populated districts of Southern and Central Africa, where lions, leopards and hyenas abound, the natives live in huts like beehives, firmly fixed among the large branches of the tree. On the approach of night they ascend to their huts by means of rude ladders, while the lions roar about their camp fires until the approach of day drives them to their lairs. As many as thirty families have been found to occupy a single tree. In many instances, natives who till the ground at any great distance from their tribe build these huts for nightly accommodation. In travelling through the country one frequently sees these trees alive with baboons and other kinds of the monkey tribe, busy in collecting the fruit and indulging in ceaseless gambols and chatter; for this reason it is commonly called the monkey bread tree. When the tree is not occupied as a habitation, the hollow trunk is used by the natives as a sepulchre for executed criminals—the law of the people denying them the right of burial—inside of which the bodies dry up and to a great extent resemble mummies. To European this tree is a marvel; coming across one inhabited by monkeys, it is extremely dangerous to shoot any unless one is with a party, for, if any are wounded, the whole colony take up the battle, and more than once I found that a retreat in short order was necessary.

My first experience of living in the air was very novel; the first night was one continual growl, roar, etc., so much so that I found it an impossibillity to sleep: finally the most horrible squeal broke out directly under me; it was very dark and being unable to see any objects but knowing something was wrong, I threw a can

containing water out of the hut door down in the direction from where the noise proceeded, but with little results, though the squealing became fainter; in the morning a small pig we had been keeping and put in a pen over night was missing. What took him nobody ever knew, as no trace remained; it only went to illustrate how we might have fared had we been camping on the ground. Having found a friendly tribe who placed their huts at our disposal, this saved us much anxiety of mind, and a few days later a number of their men accompanied us a considerable distance to the south not, however, going outside the pecincts of their country.

This wonderful tree is also found in India, and is there held in great veneration by some natives, so much so that anyone guilty of cutting the trees down is regarded by them with great abhorrence.—*American Agriculturist.*

SLIPPERY ELM.

There is a number of the elm family, the slippery elm (*Ulmus fulva*), that is seldom mentioned, although it is widely diffused all over North America, so far as we know, and is one of the best known of all the elm family. Its distinguishing characteristics, leaves broader, slightly inclined to silver hairiness underneath, wood coarser, firmer and more durable, and its foliage more umbrageous than the other varieties. We have never read a description of this tree and have never known it to be used for any purpose except fence rails, journal boxes, bushing for old time grist-mill spindles, cogs, rounds for "trundle heads" and such like. It is not used for any purpose now as we are aware of, and its growing scarcity will probably prevent its utilization for any purpose. The inner bark contains a very large amount of mucilage that is peculiarly soothing as, an emolient to swellings colds, bronchial and a great many other affections. The demand for the bark for medical purposes has almost entirely destroyed the slippery elm in thickly settled sections, and it is now kept for sale in the drug stores. Another cause which operated greatly to destroy this tree in the South was the great fondness of the children and negroes for its inner bark for chewing purposes. Thirty or forty years ago it would have been hard to find a small boy black or white, in Middle Tennessee who didn't have a few pieces of Slippery elm bark about him. It is certainly wholesome and probably nutritious, and in this respect far superior to various chewing gums of to-day.—*Southern Lumberman.*

ASH FOR CARRIAGE WORK.

An authority on carriage building says, in seasoning ash, we must take into consideration the large quantities used in carriage building, also the bulky nature of the timber whilst in its unconverted state, which compels us to use the simplest and readiest means in seasoning without sacrificing the qualities of the timber. The best way to do this is to convert the bulk into plank as soon as possible, and, whilst seasoning to assist nature in every way without forcing, and when nearly seasoned to cut into sizes fit for use. For instance, brougham pillars brackets, beds for under-carriages, and especially the heavier sizes. Before stacking ash, it is well to see the character of the timber, for if it is of a twisted nature it must be stecked one plank over the other, if not it may be placed on edge or on end, which will season it better and quicker. Besides being used in framing and such parts, it is largely used for bent work, such as steamed rims for wheels, futchels for carriages, top-sails in white chapels segment pieces in brougham fronts. But the action of steam in dissolving the gummy matters within it deprives it of much of its native toughness.—*Timber Trades Journal.*

MURDER ON THE GATINEAU.

OTTAWA, July 7.—A resident of the Upper Gatineau, who arrived in the city last night, gives the following information of a fatal affray which occurred in that region a few days ago between two lumber drivers, who were coming down the river. Some little difficulty had taken place between them over the work which each man should do, which finally led to blows and a rattling fight ensued. One of the men by the name of Joseph Phillips was getting the worst of the encounter, when he seized a handspike that was lying near by and struck his opponent, whose name is not known, a terrible blow over the left shoulder, breaking the collar bone and felling him to the ground. He was about to repeat the blow when the the wounded man putting his right hand into his rear pocket pulled a self cocking revolver and shot at Phillips. The ball entered just above the heart. Phillips died instantly. The murderer is in a precarious condition. The affair took place some sixteen miles from Gilmour's camp.

ATTACKED BY CATTLE.

On Saturday last, while "Bill" Mackay, of Apsley one of Kirby's gang on the drive, in the employ of the Rathburn Company, was in search of water on Hickory island, in the Trent river, he was attacked by a vicious bull. Thinking there would be little virtue in patting the animal on the neck at such a time, Mackay ran away from him and sought refuge in a small tree. The bull followed him and coming up to him began a loud bellow which attracted other cattle that were feeding on the island, and the whole herd numbering about forty, rushed to the spot and roared and galloped about like wild animals. Mackay shouted to his comrades, ten in number who comprehending at once the position in which he was placed, hastened to his help, and with pike-poles, and levers, and shouts and dog-barking, managed after a fierce fight to route the furious herd. Then they entered into a hot conflict with the bull, and he was soon vanquished. William dosen't know much about fear, but he got a fright when the cattle surrounded him which he will not soon forget.—*Campbel ford Herald*

LUMBER DRIVES.

EAU CLAIRE, Wis., July 7.—The drives in the lumber region, of which the Chippewa river and its tributaries are the waterways, have arrived at a stage where accurate figures can be furnished. On the Eau Claire and its tributaries 50,000,000 feet of logs were cut last winter, and 10,000,000 feet of old logs had been left over from the previou season Of this 60,000,000 feet old and new logs, about 45,000,000 have been driven out. From the upper Chippawa and its tributaries about 45,000,000 feet have been driven from Little Falls dam above Chippawa Falls The total of all logs this spring as named at the close of the logging season 750.000 000 feet. Of the 315,000,000 yet left on the Chippewa and all tributaries including the Eau Claire, a large proportion will yet be brought down. All the saw mills in the valley have had a full supply of logs. Driving will go on until late in the fall.

Forest Fires.

MILWAUKEE, July 8.—At a fire at Romeo eleven dwelling houses, one boarding-house, two warehouses, a sawmill, a planing mill, eight million feet of lumber and five million shingles were burned. Loss $130,000; insurance $50,000. About 60 men are thrown out of employment and 27 families left destitute. The woods south of Romes are all on fire, men and women are out fighting the flames. Van Hosker's mill and buildings have been destroyed. Loss, $100,000.

THE Witby Ont., *Gazette* says:—A railway official was in town on Friday making arrangements to repair and extend the side lines of the railway at Whitby and Port Whitby so as to give better accommodation to the Georgian Bay Lumber Company, who will begin in a few weeks to send at least 24,000,000 of feet of lumber to the port here for shipment over Lake Ontario. The Company shipped from here last fall, and many seem to have formed the impression that the lumber trade would return to Port Hope. It seems that the reason that the shipment did not begin earlier is because the company never move the lumber until the middle of July. It is expected that twenty hands at least will be employed at the docks until the close of navigation.

SUBSCRIBE for the CANADA LUMBERMAN.

FOREST FIRES.

CADILLAC, Mich., July 7.—Fires in the wood are burning fiercely, and every one is fighting the flames. The greatest danger seems to be in from the north, and the wind is blowing strong from that way. Herring, a small town north of here, is reported in great danger. The van eer and pannel mill a short distance from town is in immediate danger.

EAST TAWAS, Mich., July 7.—Forest fires are raging here It is reported that large quantities of railway ties are burning along the line of the Detroit, Bay City and Alpena Railroad The crops are drying up.

ST. IGNANCE, Mich., July 7.—The forest fires have nearly burned themselves out after doing an immense amount of damage. The loss is placed at $75,000, besides damage to standing timber which cannot be estimated. No more damage is apprehended. All the crops in this region are parched for want of rain, and a great many fields look as though fire had run through them. It has been excessively hot and dry for two weeks, and the farmers are praying for rain.

SPENCER, Wis., July 7.—The entire hamlet of Romeo was burned this afternoon, including the saw mill, plaining mill, five million feet of lumber, and the store, boarding house and dwelling of Wm. Van Hosear; loss, $150,000. The woods are on fire and further particulars cannot be obtained.

SHELTER BELTS.

THE annual Forestry Report of Mr. R. W. Phipps is deserving of careful perusal and consideration. The whole subject is one of great and growing importance but there is one branch of it that is particularly and especially important to our farmers, and through them indirectly to the whole community which must be effected by the well-being of the greatest industry of the country. This point, that of "shelter belts" or plantations to act as screens, is thoroughly discussed by Mr. Phipps in his report. He shows plainly the great benefit that may be derived in various ways from such belts, by shelter from the cold northerly winds, by retention of the snow to protect the young crops in winter, by shade for stock in the summer heats, &c. Details are given to show how such plantation can by successfully established and at little cost. Statistics prove that besides their beneficial effects, a pecuniary return can be obtained from these timber belts, even at an early date, sufficient to compensate the farmer for his expense and trouble. Even they who would argue that a crop of trees would give too slow a return of which they could not hope to reap the advantage, may be convinced that there would be a more speedy benefit. Any one wishing to sell his farm would find that in a very few years he could obtain an additional price that would far overbalance the cost of such an improvement. If he wishes to retain his farm for the benefit of his sons, he could hardly find a better way of increasing the value of the property he would have to leave to them. But in fact unless far advanced in years he might well look forward to obtaining himself a very handsome profit on his expenditure in the indirect form of better crops and the direct form of a return from the plantation itself.

Mr. Phipps makes all this plain in such full detail that we would strongly advise our farmers to read his report for themselves. It can be obtained on application addressed to him at the Department of Agriculture, Toronto.

LOGS AND TIMBER.

The Minden *Echo* says:—Four saw log and one timber drive, all belonging to J. M. Irwin, Esq., of Peterborough, are now passing through this village. The saw log drives contains twenty thousand each, making a total eighty thousand logs, the greater part of the logs being 16 ft. long and are the largest and finest logs that have passed here for a number of years. The timber drive contains 1500 pieces of very choice waney timber. All of the timber and logs were made this past winter, in the townships of Eyre and Havelock under the management of Mr. Geo. S. Thompson, of Lindsay, who is also superintending the drives. There is a crew of twenty men on each drive, making a total of one hundred men. Mr. C. Austin is pusher off the first drive and that overgrown and well-known genial Irishman, Mr. P. Maher, commonly called "Paddy" pusher of the second, Mr. G. Johnson, the third, Mr. Thos. Preston, the fourth, and on the last is the easy going, never in a rush, Capt. V. H. Anderson, of Bobcaygeon, who was such a favorite of General Wolseley's that he sent the captain here home from Egypt covered with medals and glory."

THE NORTH SHORE.

SUDBURY, Ont., July 10.—Atcive work is going on among the mines at this point. Mr. Ritchie, of Ohio, purchased a quantity of mineral land and has 36 men employed in developing it. Some work has also been done on the Beaver mine, north of the main line, with very satisfactory results. From the Stobie mine a quantity of ore is being shipped and a practical test of its value will thus be obtained. The Murray, Faulkner, and McConnell mines are not yet in operation, and two new fines have been made this season whose value has not yet been settled. Some work has also been done on the Eyre mine, but no shipments have yet been made from any of them.

Work on the Algoma branch of the C. P. R. has been resumed, and the engine goes down ten miles already. The lumbering operations of the C. P. R. seem very successful. A large quantity of wood, &c., has been got out by the settlers, and two fire inspectors traverse the country to guard against forest fires. A Gospel tent is pitched near the station, and two young men hold religious services every evening, and a Sabbath school and Bible class meet in the court house on Sundays. Settlement on the adjoining lands has begun, and society is gradually settling down from the construction of a line through the wilderness to a country village with a tributary rural population. The fly season is nearly over and the berry picking has fairly begun. Strawberries, blueberries and currants are now in season, and raspberries are on the way.—*Mail.*

Bush Fires.

SUTTON, Ont., July 10.—Advices from Ravensboe, York Co., state that bush fires are raging near the Sutton Branch of the Midland Railway. The woods are on fire for miles around that village, and it is in great danger of being destroyed. Scores of settlers have deserted their homes, and are hurrying with their effects away from the bush. The loss to settlers will be very great,

CHICAGO, July 7.—The "bull" movement in wheat was continued yesterday. The sudden change to a season of intense activity from one of settled dulness caused hundreds of members to regret the rashness that caused them to seek a Summer respite from an afternoon session. Not a few express regret that some power was not vested in the President at once to re-establish an afternoon session. There is on every hand the utmost confidence that the "bull" movement has come to stay, and that the tendency will be rapidly upwards. It is reported that the bucket shops are 16,500,000 bushels short to their customers.

For Sale at a Sacrifice.

A SAW MILL

SITUATED in excellent locality with an attachment of 200 acres of well timbered land through which flows the Nottawasaga river. Best water privilege in Simcoe. Capacity of mill eight thousand feet daily. Enough custom work to pay running expenses. Satisfactory reasons for selling, Box 60, Alliston, Ont. 2t.13

Wanted.

THREE HUNDRED THOUSAND feet of dry inch basswood culls.

BELDEN & McDOWELL,
Syracuse, N. Y.

3t.14

NORWAY PINE.

Until recent years Norway pine in Michigan was regarded as not of much value. It was esteemed by lumbermen about as hemlock is now. In lumbering operations hard pine was discarded and only the soft variety cut for the market. Within recent years, and since the demand for all kinds of forest products has become colossal, Norway pine has gradually come into use in the form of dimension, until now there is a large demand for it. All around lake Michigan, and on the Huron shore, Norway is coming down to the mills in increasing quantity year by year. When once to the lakeside, vessels easily transport it to to the great markets. In the large cities, like Chicago, Milwaukee, Detroit, Toledo, Cleveland and Buffalo, large quantities of Norway pine are consumed in local building operations. It has become a favorite in heavy buildings, in the shape of dimension, on account of its strength. In this city, where more dimension is used than in any other west of Philadelphia, probably the larger portion is Norway pine. It mainly comes from east shore of lake Michigan, though numerous cargoes arrive every season from lake Huron ports. The demand in this city is on the increase, and will be as the city and suburbs grow. It is also shipped to near-by points, but for long distance shipment it is not liked by the wholesale dealers, though some of it, when bone dry, is worked into bills ordered for territory beyond the Mississippi.

It is estimated by a competent judge, who has for fifteen or twenty years been familiar with the timber resources of every county in the lower peninsula of Michigan, that about one-third of the standing pine in that part of the state is Norway. Much of this is of the sapling variety, and unfit for anything but common, short and slim jim piece stuff. Heavy timbers and car sills must be sawn from the larger and more ancient growth. Of late years, in operations on the older streams, the policy of clean cutting off the land logged has been pursued. This takes in the Norway along with the white pine, and necessarily includes sapling as well as ancient growths.

Of late years the demand for Norway car sills has become a prominent feature of the mill business in the interior of the state, and particularly with the mills scattered along the lines of railroad. But this demand fluctuates with the conditions of the times and the varying prosperity of the railroads. With the decline of construction which began in 1883, and emphatically after the collapse of the stock market that followed the Grant & Ward failure in May, 1884, there came a falling off in the car sill requirement. Rolling stock building fell to a minimum, so that the call for car sills was slow and scattering. Railroad mills suffered in consequence. But with the measure of revival in railroad matters that began to be manifest early last fall, came increased inquiry for car sills. At first it was fitful and cautious. Mill operators, that occasionally got a nibble of an order, sold the stuff cheap, and dared not indulge much confidence in the outlook. At first they were willing to contract heavily at $7.75 a thousand. In October or November they would have been glad to contract all they could have sawed for months at $8.50 to $8.75 a thousand. In December an entire mill cut at Cadillac could have been obtained $10.40, at the mill, and could have been delivered in this city at $13 to $13.50 a thousand. Two or three months latter dealers were mentally clubbing themselves because they did not close bargains at those figures, for prices went up to $13 at the mill and $16 delivered in this city or contiguous points. In fact, before navigation opened in the spring, orders were placed in this city at $19 a thousand. During the season of navigation prices are modified and kept steady by reason of low lake freight rates. Stuff cut inland twenty or thirty miles, or nearer, is run to a lake port and reshipped at rates lower than by an all-rail haul.

It is a matter worth inquiring about to know why car sills car sell delivered at $16 a thousand, while Norway short, heavy timbers, up to 12x12 inches in diameter, have to beg for $10.50 a thousand. The answer is, simply because car sills can never be kept in stock, or put on the open market; they have to be sawed to specification. And specification in the matter of car sills is of great variety, though all are on a basis of 4¼x8¼ to 6x8 inches in cross section, but they vary in fractions of an inch, and possibly an entire inch in isolated cases, above the initial dimension. No mill operator can saw and pile up car sills and wait for a buyer. No buyer for a car manufactory can contract ahead of the work actually in shop. Each order for cars is accompanied by specifications as to the size of the sills. When these are ascertained, the order is sent to the mill. If a car works were mortally certain of having a contract to build a million cars, not an order for a car sill could be given until the specifications had been received by the master builder, not even if lumber were on the jump upward in price three points at a jump.

Hence we have the remarkable phase of the car sill trade that has been witnessed within the past nine months. Last August nobody knew anything about car sills beyond the fact that there was no call for them. In September there was a whif of demand; in October, a gentle breeze; in November, a fair wind; and after January 1st, a stiff gale. Since the opening of navigation and the strikes in May, the demand has slowed down a little, but it is now by no means dead, or dealers would not be able to get $16 a thousand for them, while other forms of stock dimension can be had by the cargo, and much of it just as good timber, for $9 to $10 a thousand.

Now why did the car builders have to give $17 to $19 a thousand for car sills in February and March last, when the mills would have been glad to have sawed them by the million in August before for $7.50, and delivered them for $10 a thousand? Simply because the car builders, though they anticipated a demand for cars, could not place orders for sills until orders and specifications for cars were in their hands.

The competition between Norway and southern pine car sills is a matter of some interest. In the item of strength the yellow pine had the lead. But, as a dealer in this city remarked, mere superiority of strength does not always win. A car sill need not necessarily outlast the other portions of the car. In a smash-up a yellow pine sill would break as well as a Norway sill. Cost has something to do in determining the purchase of sills. Yellow pine may make a superior support to a car, but where Norway is good enough, and about $8 a thousand cheaper, that settles it with many builders and buyers.—*Northwestern Lumberman.*

CALIFORNIA FORESTS.

A special edition of the San Jose, Cal., *Mercury*, an excellent specimen of newspaper enterprise, containing a description of the principal features and industries of the state, gives the following in regard to the forests:—

THE REDWOODS.

Eastern tourists find the redwoods in the vicinity of San Jose the most convenient to visit. As it is the only tree of its kind in the world, and the California coast the only place where it grows, our visitors will doubtless wish to know something about it. It is essentially the product of a moist climate, and is practically limited to such portions of the coast range as are composed of or covered by the sandstone of the petroleum formation. In Santa Cruz, Monterey and Santa Clara counties the territory producing this valuable tree is only from three to eight miles wide. It grows in clusters and is not found, like the pine and fir, in forests of a uniform density. Consequently, many portions of the redwood territory contain little or none of the timber which grows most plentifully along the deep, moist ravines. The redwood forests were a wonder to the first immigrants, who had been accustomed to think a tree three feet in diameter a giant, and one twice that a fable, to be told in the same breadth as one of Baron Monchausen's stories. When they found trees twelve or fifteen feet in diameter, with a trunk towering a hundred feet high, without a limb, their stories were hardly believed and tested the credulity of our eastern friends, until overshadowed by the discoveries of their relative, the Sequoia gigantea of the Sierra Nevadas.

Notwithstanding the beauty of the forest, the settlers proceeded to chop them down with the same eagerness that they would shoot a seven pronged buck or a stately elk, until one is about as scarce as the other;—though the new railroad recently built from San Jose to Boulder Creek reaches a virgin tract of redwoods. Marvellous stories are told of the amount of lumber obtained from one of these giants. One man in the vicinity of Saratoga built a house and barn and fenced in forty acres with a high rail fence from a single tree. It was common to split straight boards twelve feet long, a foot wide and a half inch thick, which could be easily dressed into siding for a house. It was not uncommon to cut 75,000 feet of plank from one tree. Two hundred thousand shingles, or "shakes," were often made from one trunk. When a tree failed to split freely, it was left to be destroyed by fires, which were thoughtlessly kindled by nearly all who worked in the forests in early days, the victims of fire being as numerous as those of the axe.

METHOD OF LUMBERING.

At first the destruction of the forests was limited to such portions as was accessible to waggons, but as the demand for lumber increased and railroads facilitated the carrying of lumber to distant points, new methods were invented which made it comparatively easy to strip the ravines and mountains to the very heads. This is accomplished by what is called a skid road. As this is in universal use from the most southern point of the redwoods in Monterey and Santa Clara counties to Puget Sound, our readers will be interested in a description of it. A mill site is selected as near the redwood groves as the nature of the ground will permit the building of a waggon road, the place being generally where several wooded ravines converge together. The waggon road is sometimes very expensive, being carried across rocky canyons, or around steep side hills involving the cutting away of huge redwood roots or the blasting out of hard ledges of rock. Some of these roads are built on declivities where "getting off the grade" means a rough and tumble descent hundreds of feet into a rocky gulch below. The mill being located, then commences the building of a skid road up the ravine to be first worked out. A road eight or ten feet wide is made with a grade as uniform as the ground permits. Sometimes the roadway has to be raised eight, ten, or perhaps fifteen feet, with log pens filled with earth. After the grade is completed the road is laid with timbers resembling railway ties, two or three feet apart, and sunk into the ground the depth of the stick. At either end the ties or timbers are held in place by braces extending from one to the other, locked in by tenons and corresponding notches. Without these braces the first log coming down the road would be certain to leave it in ruins; with them a road will bear the transporation of logs an entire season, or until the gulch is exhausted of timber. When finished the road, with its cross-timbers just above the ground, resembles a winding stairway, and the dense shade of the overhanging trees gives it a romantic and enchanting appearance.

WORK REQUIRING SKILL.

A trip up the stairway a half-mile or less to the scene of active operations takes the romance out of the scene. Great trees are being felled, sawed in proper lengths, and tumbled or slid down to the roadway. Generally the bark is removed from the logs to facilitate their sliding. In case the road is steep it may be omitted. On a flat road the trees must not only be pelled, but the skids must be greased to facilitate the sliding of the log train, for several are fastened together by dogs and chains to make an even run, one log pulling its neighbor along or holding it back, as the case may be. A "bull-whacker," who has worked his team of four yoke of cattle up these stairs with his terrible bunch of braided thongs, now hitches to the train and starts his team. If the road is well constructed and he has judged correctly of the force of gravity and the resisting friction, he engineers the train safely to the mill. If he thinks the log will slide and overtake his team, he puts a chain around some of them, making what he calls a rough lock. If the train is too heavy he detaches some of the logs, so the cattle can pull the remaining part. It requires a great deal of experience and good judgment to "gulch" logs. Sometimes with all due caution a train of logs will start into rapid motion down the incline. Then the only way to save the team is to lash them into a run to keep them before the logs. If overtaken the team is likely to be maimed, crushed or killed by being dragged over the rough load. A good teamester, who can gulch logs without injury to his cattle, gets the highest wages. When an ox is injured it is slaughtered and dressed for beef. Many of the logs are so large that they have to be blasted before they can be got into the mill. A twelve-foot plank is a useless thing, except for a sample of California productions, and withal is very expensive. Very little lumber is wanted more than two feet wide, so when a huge log is drawn to the mill it is halved or quartered to reduce it to workable proportions.

TIMBER ANNUALLY CUT.

The United States commissioners of Forestry in 1880 estimated the annual destruction of timber as 186,635,000 feet of lumber. This includes all the mills in the redwoods of California. The amount of timber left on the Mountains around Santa Cruz was estimated at 1,555,000,000 feet. This is probably a low figure, as the "great basin" (so called), fifteen miles long and six miles wide, from its inaccessible situation has not been touched. Much of it is estimated as yielding 1,000,000 feet to the acre, and all of it is as well or better wooded than the portions already cut over. The companies now working in the redwoods in the vicinity of Santa Cruz, with the approximate quantities cut annually, are as follows:

Mills	*Feet*
Loma Prieta	5,000,000
Hptos mill	3 000,000
Ryder and Co	2,500,000
Olive & Foster	1,500,000

Total per year	36,500,000

In addition to this must be considered the timber cut for fuel and mining purposes. The Santa Clara Valley Milling and Lumber Company take out of the Santa Cruz mountains the equivalent of their sawed lumber in wood and hewed timbers. Every road leading to the redwoods is thronged with wood teams on account of parties not mentioned in the above enumeration, enough to swell the whole annual consumption to at least 50,000,000 feet of timber from the Santa Cruz mountains alone.

REPRODUCTION OF THE FORESTS.

The redwood, unlike all other conifers, propagates itself principally by suckers from the parent stem. When a patriarch dies a thousand young trees, so to speak, spring from his loins, the most vigorous surviving. Nearly every cluster of tree is arranged in a circle, the diameter being sometimes as much as forty feet, indidating the former existence of much larger trees than the present, perhaps equal to the sequoia of the Sierria Nevada, where millions of young pines succeeded the scattering trees destroyed by the miners often numbering hundreds to the square rod. If any care were exercised in the preservation of the redwoods not large enough for lumber, the present quantity of growing timber might be maintained, but the lumbermen make it a point to "work the claim out," cutting the timber all away in one season, as the skid road is usually destroyed by the winter rains. A few owners are preserving the trees not only for their intrinsic value, but for the benefit they confer on the country by inducing rainfall, preserving the springs, etc. It would be well if more of such men would become proprietors in the redwoods.

THE "gate" in the Conger lumber Co.'s mill at Parry Sound, and the mill was partially closed for some days.

CAPACITY CIRCULAR SAWS.

The following is from Emerson, Smith & Co's hand book for sawyers: "How much lumber to each horse-power will a circular saw mill cut? is often asked. A horse power is that which will raise 33,000 pounds, one foot high per minute; 12 superficial feet of heating surface on a boiler, is supposed under ordinary circumstances, to generate steam for one horse-power. In a large mill of thirty horse-power capacity, each horse-power ought to manufacture 1,000 feet of lumber; but in smaller mills, proportionately less. A ten horse-power ought to manufacture or saw 5,000 feet per 12 hours. Mills of larger power than 30 to 40 horse, ought and generally do, overrun 1,000 feet to the horse. The friction of a small mill being proportionately greater than that of a larger mill, the leverage upon circular saws of same size being the same in each, and the power required to keep up the momentum being the same in both, is the cause of this dis proportion in capacity. In very hard timber 16 teeth to every inch of feed is a suitable number. And in soft timber, 8 teeth, and in medium or mixed timber, hard and soft, 12 teeth to every inch of feed is plenty. The above rule applies to saws not thinner than No. 8 gauge. Saws No. 8 gauge and thinner require proportionately more teeth; thicker than No. 6 gauge require proportionately less teeth.

Each tooth in a circular saw, No. 9 gauge, and thicker, that is used on a board mill, will cut on an average from 500 to 1,000 feet of lumber per day and consume from one-half to a full horse power.

A SAW WITHOUT TEETH.

A saw without teeth that will cut steel rail in two minutes is in operation at the Central Hudson shops in Greenbush, N. Y. The saw is run by a ninety horse power engine, more power than is required to run all the other machinery in the shops, and is 38 inches in diameter and $\frac{3}{8}$ of an inch thick at the edge. The disk is made of Bessemer steel and runs at a very high rate of speed. While in the operation a Band of five encircles the saw, and the many sparks flying from the revolving disk resembles a display of pyrotechnics. To keep the saw cool and to prevent it from cracking, a tank of water is placed above the machine from which a small stream runs down and drops on the saw while in motion. By this plan one saw will cut nearly 3,000 rails before it is worn out. A steel rail after about six years' constant use, becomes battered at the ends, and by cutting them off the rails can be used in branch and switch tracks. Rails are cut by this machine for the whole line of the Central Hudson railroad. The saw while cutting, bears down hard on the rail, the end of which is left as smooth as the bottom of a flat-iron. One remarkable thing about the machine is that the chips cut from the rail fly back under the the saw with such force as to form a solid piece of steel nearly as firm as the rail itself.

A BIG POPLAR.

The Cornersville (Tenn.) correspondent of the Marshall *Gazette*, writting to that paper says: "The big poplar tree in Dogget's cove has been a noted landmark for nearly 70 years, and is more talked of, perhaps, than any tree in the state. Its size has from time to time been given all the way from 29 to 33 feet in circumference. Passing that way recently I went to the tree, viewed it and measured it carefully. The bark, which was three or four inches thick, had most of it fallen off, and I found it to be 26 feet and, perhaps two inches in circumference, clear of any spurs. It has the appearance of being slightly hollow, and is in dying condition. The trunk is fully fifty feet to the first limb. It is a monster tree and there is a vast amount of good timber in it, but it will soon be ruined. This section has always been noted for its large fine trees. A beech tree standing on the old county line, about five miles north-west from this place, and which was blown down some six or eight years ago, had a perfectly straight trunk of nearly 60 feet, clear of limbs, and was 5 feet 5 inches in diameter, and in consequence, difficult and hard to handle."

BRITISH COLUMBIA saw mills are said to be kept very busy, and are scarcely able to keep up with the orders that are coming in.

WISCONSIN LOGS.

A careful inquiry among lumbermen leads to the discovery that about two-thirds of the log crop is hung up, and cannot be delivered at the booms without a freshet. Of the 200 000,000 feet of logs banked on the Wisconsin and its tributaries north of the city, less than 70,000,000 feet have as yet reached the booms. About 35,000,000 feet are laid up in the Tomahawk, having made all stages of progress from the source to the mouth. The remainder, about 95,000,000 feet, are in the main river between Eagle and Stevens Point. About ten days ago a jam formed on Grandfather, which, from last reports, remains unbroken. This caused an abandonment of the Tomahawk drive, and a cessation of labor by the association. The drive for the season is virtually ended, and unless there comes a freshet not a log can be moved. Quite a number of the mills have hardly enough stock for a two weeks' run. The weather during May was unprecedentedly dry, and all the driving streams have shrunken and dried up much earlier than usual. Add to the dry weather the forest fires which have burned many thousand acres of pine, and the outlook for lumbermen and timber owners is not rosy. Indeed, it is a matter of serious moment to the entire people of this valley. Without logs the mills will be closed. This means hard times for laborers and merchants and will bring distress to many a family. It is beyond all human power to afford a remedy, and it behooves the laborers and workingmen to make hay while the sun shines. Let them practice economy, act soberly and be industrious.— *Wausau Central.*

A BENEFIT EITHER WAY.

American owners of timber limits in Canada acquired them with the intention of taking over the logs and manufacturing them in Michigan. The increase of the export duty to $2 per thousand feet makes this design difficult of execution. It is probable that some logs will be taken over, in which case the Canadian treasury will get the benefit of the extra duty; and some mills may be erected by Americans on Canadian streams, by which the manufacture of lumber here will be extended. Owners of Canadian limits, residents on the other side, are reported to be about to try both experiments. One of these limit holders has sold at a good profit. The future state of the American market for lumber will probably determine whether logs will hereafter be shipped to the States in large quantities or manufactured here. Meanwhile there seems to be a disposition to prepare for both contingencies; and if expensive mills be once put up in Canada, the motive to work them, while any profit can be made, will keep them in operation.— *Monetary Times.*

THE Monetary *Times* says:—There has been shipped by the Collin's Inlet Lumber Co., so far this season, to outside markets, some two and a half million feet of lumber, leaving about the same quantity still in the yard. We learn from the Manitoulin *Expositor* that the drives finished last Saturday. Cutting commenced in May and will be continued till October. About 75 men are employed by the company. The same journal states that the largest load of timber that ever left Canadian shores on on bottom was contained in the barge L. Hotchkiss. It was consigned to the Michael's Bay Lumbering Company at the south side of the Manitoulin Island on the 18th, and was composed of 18,000 ties, 12,000 pavement posts and 500 telegraph poles, a number of the latter being 55 feet long and two feet at the butt, the whole measuring 18 feet from the deck. This company has shipped, or will ship this year, half a million pieces in ties and posts, a million eet of lumber, and about 15,000 telegraph poles. Shipments are expected to be finished about the end of October.

DURING 1885 there was shipped from California to Australia 5,950,000 feet of redwood pine. This, in one way, indicates the possibilities of Canadian trade on the Pacific ocean when the line of steamers are running from the terminus of the C. P. R.

Market Reports.

TORONTO.

From Our Own Correspondent.

JULY 9.—Our local trade is decidedly brisk at present, to whatever part of the city we go to piles of lumber and bricks meet the eye, so that it might be easily credited that all the yards are doing a rattling business. Dry lumber of most kinds is difficult to obtain, what little there is in stock is held by the retail dealers chiefly. Dimension stuff, cut to order, is hard to procure in sufficient quantities to meet the immediate demands of the market. This is mainly owing to the fact that quite a number of mills are running on stocks for shipment, instead of bill stuff, on which they were mainly engaged last season, and the few mills now cutting to order get nearly their own price for bills, and to complicate matters the lumbermen acting on behalf of the Board of Trade have entered into what must be considered a foolish arrangement with the railroad companies, whereby lumber will in future be carried by measurement, instead of by weight, as hereto fore. The weak spot in the bargain is not in carrying by the M, but in the figures charged for the carriage. That figure will simply make a difference of nearly one dollar per M from all cardinal points to this city, and instead of any benefit accruing to the lumberman by this advance it is similarly swallowed up by the railroad companies. When the lumbermen, not connected with the Board of Trade, empowered the deputation, appointed by the said board, to act for them, it was generally understood that they the deputation would act for the general good of the entire lumber interest, it is now plain how fallacious that belief was. The blunder will prove a costly one to consumers and dealers alike. The answer to this will no doubt be that the wholesale dealer will now know exactly what his lumber will cost him landed at any point, and the consumer must foot the bill. This kind of argument will not hold water, inasmuch as any increase in the cost of the lumber to the consumer is only a tax for the benefit of the railroad corporations and a dead loss to all others interested.

Under this new departure, coupled with the facts before mentioned, all green bill stuff is likely to cost, the retailer and consumer alike, fully $2.00 per M above the present prices before the end of the season is reached.

Troubles seldom come singly. I mentioned in a former letter the trouble experienced by lumbermen, by reason of the constantly increasing annoyance to which dealers are subjected by the petty orders issued from day to day by the N. & N. W. R. R. Co. for the better conducting of their business as they term it. If a dealer wishes to alter the destination of any car from dock to local, another dollar must be added to the company's exchequer, and if wanted from local to dock the same amount must be paid; besides the numerous orders given from week to week regarding the shutting of cars. The whole matter has become perfectly bewildering, not merely to a tyro in the business, but also to many who have spent half a life time in R. R. yards. The trouble seems to originate through the clashing of two or more departments, one of which promulgates some particular order for the better guidance of the yard master, and some other officer issues some thing intended to be a great improvement on the former, until at last the yard master is as perfectly befogged as the lumberman is irrated. So the mill men may congratulate themselves on living in Paradise as compared with the men handling their cut at this end of the road.

All kinds of dry dressing and better lumber will now command ready sale here, also dry sawn lath, the latter in especially good demand. Shingles XXX also meet with ready sale. No advance in prices have taken place on the latter although our market is understocked.

MONTREAL.

From Our Own Correspondent.

JULY 10.—Fine weather has been characteristic of the past fortnight, and trade upon the whole has been of a satisfactory volume. Contractors have been providing themselves with considerable quantities in anticipation of future requirements, and there are indications of a good movement throughout the summer. The good demand for carloads which marked the early part of this month has considerably fallen off, but the business at the yards has remained active. A steady feeling prevails in regard to prices. The export from the opening of navigation to the middle of this week embrace 619,316 pcs. deals and deal ends, 59,772 pcs boards, 7,049 pcs. battens and ends, to Europe, and 2,208,875 feet to South American ports.

The following are the quotations at the yards :—

CHICAGO.

The *Northwestern Lumberman* of July 10th says :—

BY THE CARGO.

Arrivals during the week have comprised a larger proportion of inch lumber than had characterized receipts previously. A slight check has been given to the forwarding of piece stuff, as the purpose on the part of the manufacturers and their agents is to dole out consignments no faster than the market requires. The ard men are not buying dimensions to a lavisht ydegree to pile for future use, though the curren demand absorbs all that is offered.

The demand for cargoes at present is rather more active than it was last week. Receipts of piece stuff having been graduated to the actual requirement, sales are readily made at the previously quoted price of $9 a thousand, unless in exceptional cases. If there are lower prices nobody will confess it. Either $9 for short green stuff is the basis of the market or else there is the solidest combination between the yard and commission men to keep shady that was ever known—on the part of the yard men for the purpose of its effect on yard prices, and on the part of the commission dealers as natural consequence. Until this imaginary impeachment is verified we shall have to accept surface indications. If the market remains as firm as it is now a little longer, the chief danger of a slump this season will have passed. Last year at this time short green dimension was quoted at $8 75 a thousand; so it will be seen that values this season have gained but a point over prices last year. In the third week of July last year the price of green piece stuff advanced 25 cents a thousand, so that on July 25 we quoted $9 as the outside figure Will prices take a similar course this season? is a question that now interests both buyer and seller.

A cargo of Norway dimension, mostly short, but having some long lengths in it, was sold this week for $9.25 a thousand. This shows a tendency to overreach quotations when the cargo is desirable. Separate lots of slim jim dimension sell from $10 to $11, according to the quality and sawing; 2x12 and 14, and 3x12 and 14 bring $11 to $12 a thousand.

There is a large call for railroad bridge and culvert timber. Short, heavy timbers for this purpose are in urgent request. Prices vary, determinable by size and contract conditions, being altogether outside quotable accuracy. It is important to know, however, that such stuff is wanted. A bill is out for the Sioux City line of the Chicago, Milwaukee & St. Paul road—a short branch—that calls for 4,000,000 feet, which shows how railroad building absorbs the product of the mills. The vast mileage of railroad that is now under construction will require more and more timber and lumber as the lines near completion.

There is nothing new to be said of shingles or lath. Both are sluggish goods, and it is hard work to realize quotations.

The following are current quotations of cargo prices :—

Dimension, short green	$ 9 00
Dimension, short dry	9 50@10 00
Boards and strips, No. 2	10 00 12 00
Boards and strips, medium	13 00 15 00

Shingles, cedar, standard	1 65 1 75
Shingles, cedar, extra	2 00
Lath, green	1 25
Lath, dry	1 40

AT THE YARDS.

There is prevalent the usual July moderation of trade, though the dealers inclined to forget that the demand is tame during midsummer, and to regard the present dullness as extraordinary. As a matter of fact there is still a fair movement, for the time of year, if the shipping and local demand are aggregated. Within the past two or three days, however, there has been increased complaint of a falling off of country orders, the shrinkage possibly resulting from the effect the wide-prevailing drought is having on western crops.

Receipts of lumber and shingles for the week ending July 8, as reported by the Lumberman's Exchange :—

	RECEIPTS. Lumber.	Shingles.

LIVERPOOL.

The *Timber Trades Journal* of June 26th says :—Repo ts from the manufacturing districts generally speaking, show an improvement in the quantity of business done, if there be no absolute advance in prices obtained. This, however, has not yet affected the timber trade in this most desirable direction, but we can only hope that the day of better things is not far distant. The passing of the Manchester Ship Canal Bill, in which many of the local timber merchants have taken great interest, may have some influence in the improvement to which we have referred.

We are glad to notice that our Manchester neighbors have decided to hold an exhibition in that city next year, in which the chief object, as far as can be carried out will be to show the improvements in all those manufactures in which she is so deeply concerned that have taken place during the reign of Her Majesty. Committees have already been formed to arrange preliminaries, and as soon as the elections are over they will doubtless go to work with the energy so characteristic of the citizens of Manchester.

The import into Liverpool has again been in excess of the wants of the trade, both in spruce deals and pitch pine, with the natural result that both these descriptions of timber are today in a weaker position than hitherto, though the actual quotations are perhaps unchanged.

No public sales of whitewoods have been held during the past week, nor are any announced up to the time of writing.

LONDON.

The London *Timber Trades Journal* of June 26th says :—The coast trade must be described as extremely quiet, a few contracts only having been closed during the past week, and these only for minor parcels. Whether or not a general election, as conducted now-a-days, really effects the trade of the country seriously is an open question, but there can be no doubt that buyers seem only too willing to take advantage of the opportunity to look on and wait the course of events. There is a general fear that market cargoes will be pressed for sale later on, but, as far as we can hear, shippers show no intention of sending forward unsold goods.

The market for redwood battens continues dull, and few sales are being effected. 5ths

2½x7 in. from the lower ports are quoted at £5 5s. f.o.b., and 5ths at £4 5s., but we blieve that sellers are prepared to accept somewhat less for fair lines. Even at these figures, and calculating freight at 20s. to the Surrey Commercial Docks, there is little temptation for London buyers to operate, no profit being noticeable on 4th battens, even at £6, c.i.f., if the receivers have to incur the cost of landing the goods. 5th battens would naturally yield a fair mar gin, but these cannot be bought without the other qualities; so that buyers have no inducement to purchase for forward delivery, until they can discover some signs of better times. Some profit is certainly attached to sales of parcels for outside delivery, but this is a branch of trade which can only be pursued to a limited extent, although it has assumed considerable dimensions during the last and present seasons.

Whitewood is easier and battens from the lower ports can be purchased readily at £4 10s., which figure cannot now be obtained for specifications containing a large proportion of 2½x7. Both 6½ in. and 6 in. remain scarce, and the price for these dimensions has consequently been very slightly modified. We understand that the Swedes have sold the major part of their 3x9 white on the continent, but the prices obtained have not transpired except in a few instances.

Messrs. Foy, Morgan & Co. on Wednesday had the advantage of following on a month of singular quietude in public auctions, and it was therefore not much matter for surprise that buyers mustered in strong force at the Baltic this week. In addition to the Petersburg goods there was the bright pine, in handy sizes and widths, and of good quality, to tempt bidding, and as far as the prices go we consider the cargo of Quebec bright 2 in., per York City, being very well sold; 1st, broads reached £22 5s., and 1½, also wide stuff, selling at £19 15s. and £20 a couple of lots of dry, per same ship, going up to £20 10s.

The timber per Niphon, at £3 12s. 6d. (one lot fetched another half crown), realized quite as much as expected, for it would not be easy to say what the timber is most suited for.

As long as the raw wood can be obtained at the present rates, we think very little business will be done in the other descriptions. The advantage on the side of the bundle trade is that for cheap work it can go with battens and low-priced wood right on to the works, and to small housebuilders this is a highly important consideration.

There is a general impression amongst the trade that the log timber to the London market will shortly be almost nil, on account of the large quantity of thick, wide planks sent to the market which timber in the log used to supply; but we heard the same opinion expressed 20 years ago, and yet the dock ponds are well supplied. The dock authorities say it is that department of the docks which pays the worst, but we can hardly see how that can be. There is no expense on the stuff; it lies at rent for a considerable time, and requires no particular looking after; but the company must know best. That the trade, however, will die out we do not believe, and the thousands of sizes which would have to be shipped to supplant it none of the present generation will live to see.

GLASGOW.

The *Timber Trades Journal* of June 26th says:—Trade here continues quiet. A public sale of log timber took place at Greenock a few days ago, but there was not a large attendance, and of the goods offered only a small proportion changed hands, transactions being confined to some lots of yellow pine; other woods put up, oak, elm, etc., were withdrawn, as bids were under the figures required by exposer: note of prices realized is appended.

The new season's imports of Quebec log timber now at hand will, it may be expected, give some animation to the market. The first of the Quebec timber fleet has just arrived at Port Glasgow, after a voyage of 32 days, particulars of cargo not reported in time to be included in accompanying import list.

Arrivals at Glasgow for the past week consist largely of American oak planks in parcels per steam liners, and include also an import of deals per steamer from Quebec and Montreal, the total of Canadian deals landed at Glasgow this season now amounting to 64,376 pieces, at this time last year the total was 70,070 pieces and in 1884 91,850 pieces.

At Greenock the imports for the week comprise a cargo of pitch pine and one of greenheart. The arrivals of pitch pine at Clyde ports this year (represented by a carrying tonnage of 17,677 tons) are slightly in excess of last year's at this time; and for same period in 1884 the tonnage was 20 632 tons. Arrivals of North of Europe wood goods at Grangemouth continue very light, the carrying tonnage for the past four weeks being 3 610 tons, as against 15 001 tons for corresponding period 1885, and 9,545 tons same period 1884.

AUCTION SALE.

On 17th inst., at Greenock, Messrs. Singleton, Dunn & Co., brokers:—

Quebec yellow pine timber—

40 c. ft. avg. per log	1s. 0½d. & 1s, per c. ft.	
35 "	11½d.	"

Quebec red pine—

25 c. ft. avg. per log	10d.	"
20 "	9¾d.	"

QUEBEC.

A despatch from Quebec says:—The timber market continues very dull and sales are made with considerable difficulty. One old raft of 1882 timber, containing small waney and square pine of about 44 feet, was sold at 14 cents, while a choice Kippewa raft of 53 feet with a small portion of waney board, 21 inch, has been closed at 25 cents per foot. For red pine there is some inquiry for shipping parcels which are worth 20 cents to 25 cents for good timber. No sales in hardwoods are reported.

The number of sea-going vessels entered inwards at the Quebec custom house from the opening of navigation up to yesterday is 228. The clearances to the same date including steamers, are 158, leaving 70 vessels in port and outports.

RAFTS ARRIVED.

JUNE 30—P. Maclaren, white pine, ash, &c., Ontario, St. Lawrence Dock Co.'s cove.

JULY 5—Thomas Buck, elm, Michigan, New Liverpool cove.

JULY 6—Barnet & Mackie, white and red pine, Nipissing, Cape Rouge.

JULY 6—J. Bustall & Co., oak, ash, elm, &c., Ontario, Woodfield cove.

JULY 7—Cook & Gibbons, elm, ash, etc., Ontario, St. Michael's cove.

T. McLaren, white and red pine, Ontario, St. Lawrence Wharf and Dock Co.'s cove.

TIMBER MARKET REPORT.

Messrs. Alfred Dobell & Co., in their Liverpool circular of July 1st say:—We have to report another dull month in our trade and with the present political disturbance any improvement could hardly be looked for. Still, all things considered, the consumption during June has been fully up to what was expected. The sales by private have been:—Spruce deals—St. John, N. B., at £5 17s 6d and £5 15s per standard, ex quay; Bridgewater, N. S., at £5 12s 6d per standard, ex quay. Birch—Pictou, about 16 inches average, at 11½d per foot, ex quay; Prince Edward's Island, about 16 inches average, at 10½d per foot, ex quay. Pitch Pine—Pensacola, 40 feet sawn on private terms. Oak planks—Waggon sizes, 1st quality, at about 1s 10d per foot, ex quay. Pencil cedar—Florida wood at from 3s to 3s 3d per foot. The sales by auction have been:—Spruce deals—Several parcels of St. John, N. B., were offered early in the month, but the bulk were withdrawn, the sales being limited to a balance lot ex C. S. Parnell, from S. John, N. B. Pitch pine—A cargo from Pensacola 35 feet sawn, was offered but the bulk of the 11 and 12 inch wood was withdrawn; a cargo from Darien, 35 feet sawn, was offered at the same time, but was withdrawn with the exception of a single lot. Teak planks—A parcel from Rangoon averaging about £13 10s per load.

EDUCATE THE MIND AS WELL AS THE HAND.

Every man who is engaged in any kind of mechanical labor should cultivate studious and observant habits. There is scarcely description of knowledge but which he will at some time have use for, especially if he ever hopes to rise above the position of ordinary mechanical labor. No man can ever hope to attain distinction as a mechanic unless he educates his mind as well as his hands

One of the most important acquirements of a mechanic is that he should be able to readily and lucidly convey ideas to another. There are indeed many men who while otherwise competent to direct others have failed from lack of this faculty, or have refused good positions because they knew their weakness in this respect. Perhaps as many foremen fail from this cause as from any other. Undoubtedly, this faculty is one to be acquired; it is not one, if there are such, that is born with a man. Every man who works at a mechanical business should labor in the direction of acquiring the habit of concisely expressing his ideas, making this a part of his mechanical education. Talking of such subjects will help a man; writing of them is excellent practice.

A good mechanical eye is also a most essential requisite in a good mechanic. No one can ever attain distinction as a mechanic unless he is able to detect ordinary imperfections at sight, so that he can see if things are out of plumb, out of level, out of square and out of proper shape, and unless he can also detect disproportioned or ill-shaped patterns. This is a great mechanical attainment, and one which can be readily attained by any ordinary person. Of course there are defective eyes as there are other defective organs; the speech, for instance is sometimes defective, but the eye is susceptible of the same training as any organ. The muscles, the voice, the sense of hearing, all require training. Consider how the artist must train the organ of sight in order to detect the slightest imperfection in shade, color, proportion, shape, expression, etc. Not one blacksmith in five ever attains the art of hammering square, yet it is very essential in his occupation. It is simply because he allows himself to get into a careless habit; a little training and care is all that is necessary for success.

But in these cases the fact is, that eye is not half as much at fault as the heedless mind. Some carpenters acquire the careless habit of using a try square every time they plane of a shaving, in place of giving their minds right to their business and properly training their eyes, and unless they cultivate this power of the eye they will always be at journey work. Look at the well-trained blacksmith; he goes across the shop, picks up the horse's foot, takes a squint, returns to his anvil, forges the shoe and it exactly fits the foot. Contrast him with the bungler who looks at the foot, then forges the shoe, then fits the foot to it, often to the ruin of a fine horse. Now, the fault lies in ever allowing himself to put a shoe on that is not in proper shape for the foot; he should determine to make the shoe fit the foot instead of the foot fitting the shoe, and he should follow it up until the object is accomplished.

A very good way to discipline the mechanical eye is to first measure an inch with the eye, then prove it with the rule, then measure a half inch, then an eigth, and so on, and you will soon be able to discover at a glance the difference between a twelfth and a sixteeth of an inch; then go to 3 inches, 6, 12, and so on. Some call this guessing; there is no guess work about it. It is measuring with the mind and eye. Acquire the habit of criticizing for imperfections every piece of work that you see; do everything as nearly as you can without measuring (or spoiling it), or as nearly as you can trust the eye with its present training. If you cannot see things mechanically do not blame the eye for it; it is no more to blame than the mouth is because we cannot read, or the fingers because we canont write. A person may write a very good hand with the eyes closed, the mind, of course, directing the fingers. The eye is necessary, however, to detect imperfections. Every occupation in life requires a mechanically trained eye, and we should realize, more than we do, the great importance of properly training that organ.—*Mining and Scientific Press.*

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. patent office, June 29, 1886, is specially reported by Franklin H. Hough, solicitor of American and foreign patents, 925 F street, N. W. Washington, D. C., who will furnish copies of patents for 25 cents each.

344,580—Lathe—W. W. Hubbard, Philadelphia, Pa

344 469—Saw gauge—W. H. Wilson, Westfield, N. Y.

344,355—Saw mill dog—A. Delaney & J. M. Bond, Richmond Va.

344,356—Saw mill dog—A. Delaney & J. M. Bond, Richmond Va.

344 366—Saw mill set works—C. Esplin, Minneapolis, Minn.

344,365—Saw setting device—H. C. Hart, Unionville, Conn.

344,568—Sawing machine, circular—E. S. Collins, Meadville, Pa.

PATENTS ISSUED JULY 12.

344,926—Lathe, automatic—F. M. Stevens, New York, N. Y.

345,110—Mortising, boring, &c.—R. T White, Boston, Mass.

344,867—Planing and matching machine—C. F. Ritchel, Bridgeport, Conn.

345,868—Mortising machine—M. Rothschild, Shamokin, Pa.

345,256—Saw frame—H. L. Pratt, Brooklyn, N. Y.

345,121—Saw swaging machine—M. Covel, Chicago, Ill.

345,071—Saw table gauge—J. H. Palm, Minneapolis, Minn.

345,070—Sawing machine, circular—J. H. Palm, Minneapolis, Minn.

PLANTING TREES FOR TIMBER.

Prof. Lazenby, of Carroll University, says: To make timber plentiful, and to render our climate more genial, we must reclothe all rugged broken land and rocky crests, in fact every acre that is not cultivated, or is cultivated at a loss, with valuable forest trees.

First—All ravines and steep hill-sides, all land too rocky to be thoroughly cleared of stone and plowed, should be devoted to trees.

Second—Protecting belts of trees should be planted wherever buildings, orchards, gardens, etc., are exposed to cold, sweeping winds.

Third—The banks of streams, ponds, open ditches, etc., should be planted with trees that they will be protected from abrasion by floods and rapid currents.

Fourth—All public roads should be belted by graceful, stately trees.

We should perserve, improve and extend our existing forests by keeping up a constant succession of young growing trees of the best varieties. To do this it is necessary:

First—To allow no stock to run in woodlots for purpose of forage. This should be a rule inflexible and relentless.

Second—Young growths in forests should be thinned moderately and judiciously. Worthless varieties should be cut out and the valuable sorts should be trimmed up so that they will grow tall, forming trunk rather than branches.

Third—Timber should be cut with intelligent reference to future growth. Valuable trees that you wish to propagate should be cut in the spring. Those that you wish to exterminate should be cut in August.

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

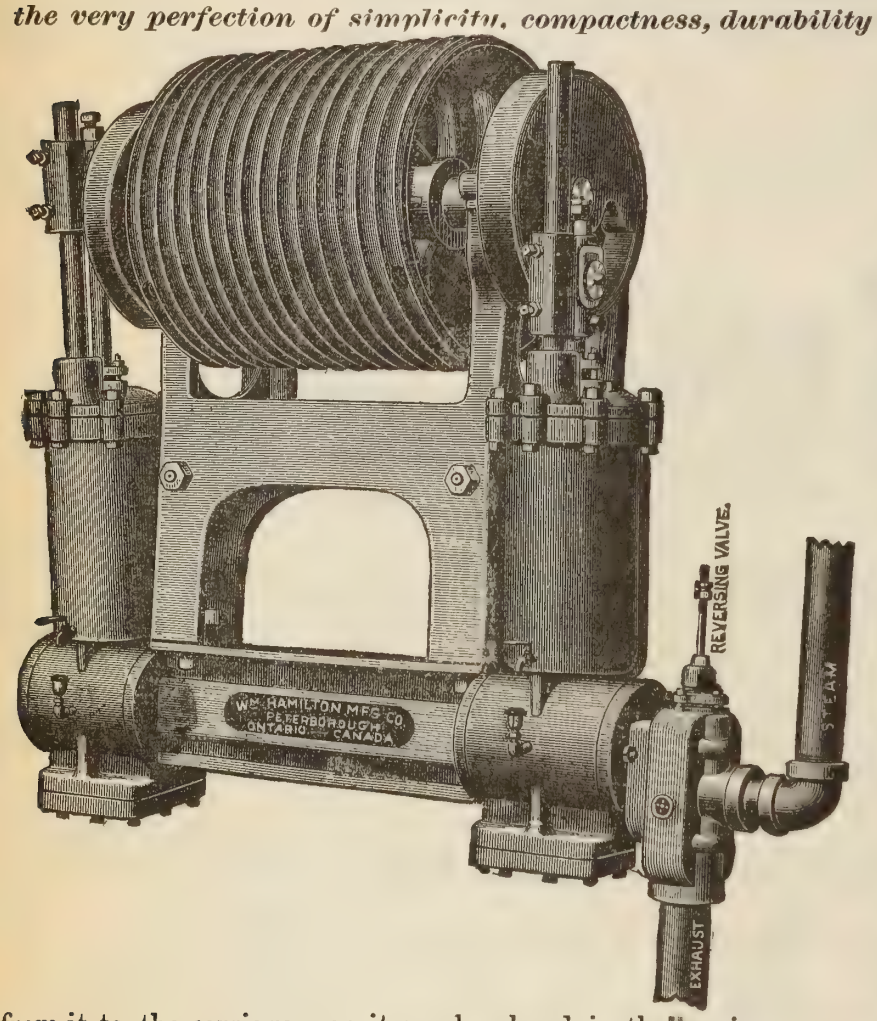
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———*CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM*———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATNG TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROP.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoud ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfai & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of his kind got up, and would ask any one wanting a good Band Saw Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacurers,***

VOL. 6. PETERBOROUGH, ONT., AUGUST 1, 1886. NO. 15

NOTES FROM THE WORLD OF WOOD.

A process has been discovered by which wood may be compressed into various designs, having all the appearance of carving, and with a finer finish. The process consists in paring hardwood shavings as thin as wafers, which are then placed in a chemical solution. When in a properly pliable condition, the mass is introduced into molds made from steel plates, and pressure is applied, which forces the wood pulp in every line of the mold. When it becomes dry, it is removed from the mold and has exactly the appearance of a wood carving, with the grain of the wood as perfect as though it had never been reduced to a pliant condition. The process is a German invention, and large numbers of different designs are now being manufactured in the the city of Berlin.

The tradition is, if the oak gets into leaf before the ash, we may expect a fine and productive year. If the reverse is the case, a cold summer and unproductive autumn are anticipated. Statistics have been collected on this point extending over 30 years. The oak displayed its foliage several months before the ash in 1818 to 1820, 1882, 1824 to 1827, 1833 to 1837, 1842, 1846, 1854, 1868 and 1869, all inclusive, and the summers of those years were dry and warm, and the harvest abundant. The ash displayed its foliage full a month before the oak in 1816, 1817, 1821, 1823, 1828 to 1830, 1838, 1840, 1845, 1850 and 1859, and the autumns were unfavorable.

The forest trees east of the Rocky Mountains have been divided into four groups, as regards their geographical distribution within the Dominion: (1) A northern group, including the white and black spruces, larch, Banksian pine, balsam fir, aspen, balsam, poplar, canoe birch, willows and alder. (2.) A central group of about forty species, occupying the belt of country from the white pine line to that of the buttonwood. (3.) A southern group embracing the buttonwood, black walnut, the hickories, chestnut, tulip tree, prickly ash, sour gum, sassafras and flowering dogwood (4.) A western group, consisting of the ash-leaved maple, burr-oak, cottonwood and green ash

Of a monster oak felled in England in 1810 the main trunk, 10 feet long, produced 450 cubic feet; one limb 472 cubic feet, and other limbs respectively 355, 235, 156, 113 and 106 cubic feet; six other limbs of inferior size averaged 93 feet each, making a total of 2,445 cubic feet of sound timber. The bark was estimated at six tons. It took five men twenty days to strip and cut down this tree, and two sawyers were five months without losing a day (Sunday excepted) in converting it into timber The main trunk of this tree was 9½ feet in diameter. The whole produce of the tree in the market brought about $3,000.

A distillery has lately been put in operation at Charleston, S. C., for manufacturing oil from pine wood. The material is subjected to intense heat in sealed retorts, and one cord of it is said to yield fifteen gallons of turpentine, eighty gallons of pinewood oil, fifty bushels of charcoal, 150 gallons of wood vinegar, and a quantity of inflammable gas and vegetable asphaltum. The oil alone is worth about 25 cents a gallon and is used by painters and shipbuilders.

There is a small tree growing in a gulch near Tuscarora, Nevada, the foliage of which at certain seasons is said to be so luminous that it can be distinguished a mile away in darkest night. In its immediate region it emits sufficient light to enable a person to read the finest print. Its luminosity is said to be due to parasites.

It is said that one of the properties specially conducive to durability in timber is odoriferousness. It is also said that the increase in strength due to seasoning in different woods is as follows:—Elm, 12.3 per cent.; oak, 26.6 per cent.; ash, 44.7 per cent.; beech, 61.9 per cent. The comparative value of different woods in respect to crushing strength and stiffness is thus shown: Oak 40,74, ash 3,571, elm 3,468, beech 3,079. Regarding relative degree of hardness, shell hickory stands the highest, and, calling that 100, white oak is 84, white ash 77.

Lieutenant Immer Gossende, of the German navy, and Dr. Kummel have explored Northeast Guinea. They report that they reached a spot twelve days' march from the coast and discovered that their compass was useless, owing to the presence of a tree which possesses the properties of a highly charged electrical battery. Dr. Kummel was knocked down when he touched it. Analysis showed it to consist of almost pure amorphous carbon. It has been named Elsassia electrica.

The *American Architect* says that the Southern pine seems to be the natural habitation in this country of the cimex lectularius, or bed bug, which is found in immense numbers under the bark of old trees of that species. If the wood contains natural clefts, the insects and their eggs remain in these after sawing and are often carried in that way in the seams of large timber into buildings It is worth noticing that living trees of yellow pine sometimes keep houses near them infested with the vermin, which stray in all directions from their home.

The inventive genius of the Yankee is constantly widening the use for lumber. Last year a concern in Maine cut up, in the aggregate 1,200 cords of white birch logs into shanks and counters for boots and shoes. Special machinery is used for the purpose, and the white birch is displacing leather board to a considerable extent. The more extended use of the hard woods in shoe making is among the possibilities of the near future.

Among the latest invention is that of a match which may be used over again an indefinite number of times. The wood is soaked with a peculiar chemical solution which renders such reusing practicable.

The following trees were in ancient times dedicated to heathen gods: The cornel, cherry-tree and laurel to Apollo, cypress to Pluto, myrtle to Venus, oak to Jupiter, olive to Minerva and Pallas Athene. It is curious to note that the laurel, cypress, myrtle, oak and olive are all funeral plants. The olive with the Greeks was an emblem of chasity.—*Exchange.*

SAW MILL AT CAMBELLFORD.

On Tuesday last we spent a few minutes looking at the operations of Rathbun & Co.'s saw mills in this village, and while there learned from Mr. Joseph Clairmont, the trustworthy manager, that the average daily product of this manufactory is 800 railway ties and between 10,000 and 11,000 lath, besides a quantity of lumber.

There are 25 men now working steadily every minute of the day, as busy as the machinery beside them, handling the logs which come down the river, and cutting them up into ties, lath and lumber.

Ten saws are in constant motion. Two large saws are rapidly revolving on the first floor, at the north end of the building, butting and edging the logs which come up from the water where they are boomed, on what, in the absence of the proper name we will call a carrier The large logs are handled with ease by the dexterous workmen, who first saw off the ends and then slide them on a truck which moves backwards and forwards on a track to and from the edger. This large saw does rapid execution, and the railway ties are cut as quick as thought and removed by men at the other end of the track, who slide them through an opening in the building and deposit them on waggons which are drawn to the cars. The slabs from the logs are then put through a planing machine and converted into lumber, while the small pieces are placed on a carrier and deposited on the second floor where men quickly cut them up into lath. They are as busy as bees, too, turning out 10,000 per day.

In front department of the building is a machine for planing and edging lumber, which is fed by Mr. J. D. Amey. Near it is the invention of one of the Rathbun company, a gummer, for sharpening saws, which is worked by Mr. Ducheman. By the aid of this machine which carries an emery wheel making 1,600 revolutions per minute, a large saw is sharpened ready for work in twenty minutes.

The shingle machine is not yet in operation but will be shortly. The engine which drives the machinery, with improvement and the care of a tidy engineer, looks like a new one. Near it is a pump and hose ready for use to quench a fire.

The railway track has been laid along Ranney street to the mill, and will be ballasted and completed in about ten days. A switch is to be laid in front of the mill, and another at the rear, on which cars will be run and loaded as the ties come from the saws. Fifteen car loads of ties were taken away on Monday.—*Herald.*

THE BUISNESS OUTLOOK

The New York *Saw Mill Gazette* says:—The semi-annual report lately issued by the mercantile agency of R. G. Dun & Co., shows a material improvement in the business outlook throughout the United States. Notwithstanding the strain resulting from labor troubles the record of business failures during the first six months of the present year shows a marked decrease as compared with the failures of the same period in the preceding year. The liabilities of insolvents for the period referred to in 1886 were considerably smaller in amount than they were in the corresponding period of 1885.

The report calls attention to other encouraging features of the times among which are the virtual decision of the conflict of labor against capital, and the fact that values of all kinds have apparently reached their lowest point. The power of the labor organizations to resist the ordinary laws of trade is not so seriously estimated as it was a few months ago. Confidence has been restored and there is a manifest disposition to extend business operations and engage in new enterprise. Good crops are now assured, generally speaking, and the fall season is looked forward to as likely to yield satisfactory returns in trade circles. The abundance of money, the result of the growth of the country in wealth, is one of the characteristics features of the times and is also a most influential factor in the business situation. In confirmation of the views expressed in this report Messrs. Dun & Co. present statements by their agents with reference to the condition of trade at all the leading business points in the country.

As regards the lumber trade, the outlook is in most respects encouraging. The temporary check to building operations caused by the labor troubles, has been succeeded by a marked activity in this trade throughout the east and west. The present consumption of lumber in the building trade is almost equal in amount to that called for at the same period last year, and it is possible that the demand for lumber for railway construction will soon exceed the mills. In hardwoods the transactions are moderate but the market is firm. Walnut is in special demand, and holders of good lots are not inclined to make concessions in prices. In sash, doors and blinds the business being done is not large, but much activity is not to be expected at this season, and it is evident that prices are being fairly sustained.

REPORTS from Temiscamingue state the timber drives on the Kippewa and Upper Ottawa are successful this season, notwithstanding that fears were entertained at an earlier date concerning the insufficiency of the spring floods.

Chips.

A FIRE in Knapp, Stout & Co. Company's yard, at St. Louis, July 18, consumed about 25.-00,000 feet of lumber in pile, involving a loss of 000

LAMOUREUX BROS., of Edmonton, are preparing a second raft for shipment to Battleford. It will consist of 175,000 feet of lumber, 100,000 lath and 100,000 shingles.

BY a new process hats are now made of wood pulp. They are said to be very fine, and more serviceable than anything heretofore on the market. Great is wood pulp.

CAPITAL is said to have been secured for building a railroad from Fargo Dak., northwest by way of Turtle lake, to the boundary of Manitoba 600 miles. It is said that a survey will at once be made.

MR. JAMES CROSSEN, of the Cobourg Car Works, obtains the contract for rolling stock of the Northern & Pacific Junction Railway. The specifications are said to confirm to those of the Canadian Pacific Railway.

THE contract of the locomotives for the Northern & Pacific Junction Railway has been let to the Kingston Locomotive Works. It calls for the delivery of two engines in Sept., three in October, and remainder in November.

A YOUNG man, named Gingras, was struck on the head by a flying splinter of wood at Drum's cabinet factory, Quebec, on July 23rd, and will also probably die. A ship laborer, named McCaulay, was dangerously injured by falling into the hold of the bark Kate Maguire.

WM. GOLDER, a bark peeler, has been found dead in the woods on the Leswick, N. B., his skull fractured and his neck broken. Beside him on the ground lay a tree, the falling of of which was the cause of his death. Golder was a man about forty years of age, and lived in Tripp settlement for a good many years.

MESSRS. RANKIN, ASHER & HENDERSON, of Dover, Ont., are erecting a saw mill on lot 19. con. 9, Dover, with a capacity of 12,000 daily. Messrs. McKeough and Trotter have the contract for the machinery, and will have it running for the fall work. The erection of the mill promises to prove a great convenience.

THE machinery department at the Colonial Exhibition is under the direction of Mr. James Clark, of Cobourg, wh has put the hall into shape without a single accidant or breakage that I have heard of. The *Canadian Exhibitor*. the journal of the Canadian department well says that no other choice of a mechanical superintendent could have been made by Sir Charles Tupper.

TWO orders-in council have been passed one authorizing that a charter be granted the other issuing it, to Archbishop Duhamel, Rev. Father Grendreau, L A. Oliver, A. Desjardins and E. Tasse, empowering them to construct a line of railway six miles long from the Ottawa river near the Mattawan at the foot of the Long Sault rapids to a point at the foot of lake Temiscamingue, with a capital of $100,000.

THE correspondent of the *Canadian Manufacturer* at the Colonial Exhibition says that in manufactures of wood of all kinds the Canadian have distinguished themselves. Messrs. Tees & Co., of Montreal, Messrs. Stahlschmidt & Co., of Preston, and the Schlicht & Field Co., Toronto, have done a "roaring trade" in office desks, letter cabinets, etc, which seems to be looked upon as both cheaper and better finished than the English article.

THE Menominee *Herald* estimates that at least 80,000 000 feet of lumber will be sent east from the Green Bay mills the present season, of which nearly 50,000,000 feet have already been heard from. The H. Witbeck company have sold 12,000,000; the Bay Shore Company, 12,-000 000; Dunham & Avery, 10,000,000, and A. Spies 400,000 feet, all of which will be shipped to the eastern market—mostly to Buffalo, during the season of navigation. Besides the above amounts, the Oconto Lumber Company has sold 25,000,000 feet of its cut to Buffalo parties.

MESSRS MASON & Co., says the Ottawa *Journal* have received an order from Messrs Hutchison & Wood to supply 1,000,000 ft. of lumber for the construction of the bridges on the new Short Line Railroad between Merrickville and Kemptville which is the extent of their contract. Messers McRae & Co., of Ottawa, have also received an order from the same firm for a large quantity of Portland cement for the stonework in connection with the bridges.

THE Chicago *Northwestern Lumberman* says:—"There are two new lumber papers in New York engaged in the amusing business of trying to scratch each other's eyes out. They remind one of two cats with their tails tied together and hung across a clothes line." We had often herad that western editors were remarkably hard hearted (as well as hard headed), but did not believe that even a western editor would watch two cats fighting, in the manner described, until the *Lumberman* made this confession.

JOHN E. STEWART, one of the corporators of the Tobique Valley railway company, has been negotiating with capitalists in Boston with a view of the immediate construction of the line from Perth on the N. B railway up to the Tobique river past Plaster Rock. This road was subsidized by the Dominion parliament last session, and an attempt will, it is said, be made to secure a local subsidy. The Tobique Valley railway runs for about forty miles through a rich agricultural region, passing through heavy timbered land.

The Monetary *Times* says:—The effect of the export duty, placed by the Dominion Governmenton pine logs exported from this country has already been that of increasing the manufacture of sawn lumber on this side of the border. We are told that more than one firm in the Georgian Bay district whose pine was expected to go to the American side to be manufactured, will be converted into lumber in Canada. Evidently there firms regard it cheaper to pay $2 duty on lumber than to pay the same duty on the logs aside from the additional cost of manufacture, arising from the higher price of labor paid on that side. It is tolerably clear that the doubling to the duty will materially check the exportation of logs.

LAST year the extensive mills and woodenware factory of Messrs. Wm. Cane & Sons, Newmarket Ont., was burnt down and as soon as the firm decided to rebuild all the old employees, voluntarily offered to donate a week's work each, as an evidence of their goodwill and regret for the firms heavy loss. Another pleasing instance of co operation, in a like manner is now recorded, as we learn that: "Each one of Mr. Tilson's employees, of Tilsonburg, has subscribed a week's wages to assist him to build his oatmeal mill. The amount thus donated will be between $700 and $800. This is something new, and speaks volumes for the harmonious relations existing between the employer and employees."

Lumber by Railway.

The Montreal *Star* of July 20th says:—A new departure has taken place in the shipment of lumber from the western districts. Previous to the opening of the C. P. R. the whole of the lumber and square timber was forwarded by water to the loading port. Mr. G. M Bosworth, the freight agent of the C. P. R, stated to a *Star* reporter this morning that the great lumber merchants in the districts round Georgian Bay and Lake Nipissing had forwarded no less than 3 500 car loads of square timber, represeuting 2 000,000 square feet, to Montreal within the last two months. The timber consists almost entirely of pine, and is sent on to Quebec for shipment to various ports.

LUMBER FOR CANADA.

DETROIT, July 27.—The deparature of the great log boat Michigan, which left Alpena in tow of a powerful tug bound far French River, Georgian Bay, for a load of logs for Tawas parties, yesterday, was witnessed by a large crowd. Notwithstanding the gradual decrease of the timber in Michigan, remains the fact of millions of dollars invested in costly mills and railways

Within the past two years Michigan lumbermen have turned their attention to Canada, and extensive purchases of pine lands have been made near the shores of Lake Huron and along the large streams emptying into that inland sea. To move their mills to that side of the lake for the purpose of cutting up the pine involves great expense. Then, too, they must encounter the tariff on imported lumber on seeking an American market. To somehow get the logs to this side would solve the difficulty, as there is but a small tariff on these. Transportation by rafts has been attempted in a few instances, but the risks are very great, as Lake Huron is a decidedly stormy body of water, and the breaking up and scattering of a single raft would sadly trench upon the profits of a season's business. Hence the experiment of the log boat, which is intended to bear the same relation to water transportation that the log train does to the railroad. If it can be managed successfully and not too expensively it promises to solve a very important problem in connection with the lumber business of Michigan for the next 20 years.

The pioneer boat, named after the state, is 294 feet over all, 42 feet beam, with 16 feet depth of hold, and has a tonnage of 1 227. She has one boiler 15 feet long, 7½ feet in diameter, and two engines. One engine has a 16 by 12 inch cylinder. The other engine has two cylinders, 14 by 12 inches each and is connected with two 10 inch pumps and also with an apparatus for hoisting anchors of which she carries two, one weighing 1,600 and the other 8,000 pounds. The chain of the large anchor weighs 20 pounds to the link and is made of 1⅞ inch wire. The apparatus for hoisting logs on board is a slip that extends on an incline to the water, in which an endless chain runs and on which are hooks which carry the logs up the slip, which is jointed at the rail and extends across the deck. Here men with cant hooks will receive and roll the logs off on to the skids, where they are held until wanted in the hold, they being there dropped into five feet of water. The water comes into the hold through a ten inch aperture in three hours, and the two eight inch pumps empty the hold again in four hours. There are two of the slips. The logs are hoisted out of the hold at the after hatches (of which there are seven) by two upright slides with arms upon which the log rests. When the log gets on deck it rolls on to a set of rollers that carry it overboard. It is claimed that the craft can be loaded in less than 20 hours. She has a full set of canvas on four spars. 10 men for a crew, and will carry about 700,000 feet of logs. The question of expense would seem to be the only one to be settled by experiment. It is probable that no special interference would be encountered from boisterous weather, and there seems no reason to doubt that as in the ore and grain carrying trade from three to six of these immense barges could be loaded and towed across Lake Huron by a single powerful tug.

IN NEW QUARTERS.

Messrs. Lord & Thomas, of Chicago, the well-known and popular Advertising Agents, have removed to new quarters which are so spacious, so elegant, and so original and novel in their appointments, that they deserve more than a passing notice The building Nos 45, 47 and 49 Randolph St, between State and Wabash Ave., is at once the most striking in appearance and the most elegant in Chicago, built of sandstone it is 70 by 174 feet practically fire proof and and lighted on four sides. Three large elevators and two spacious stairways, give abundant facilities for passengers and freight. Messrs. Lord & Thomas occupy the entire third floor, giving them a superficial area of neerly 12,000 square feet. This beautiful lighted room is unbroken by partitions save a private office in one corner and work passes with great regularity. While the entire appointments are elegant, the filing department is arranged on an entirely new principle, which amounts to an important invention. Heretofore Advertising Agents have filed their Newspapers in wooden pigeon holes, which not only excluded the light, but caught and retained the dust, and thus proved a nuisance. The new filing department of Messrs. Lord & Thomas is made entirely of wire work; a separate compartment is made for each Newspaper, Magazine and Periodical in the U. S. and Canana, about 14,000 in all. The various sections are suspended from the ceiling, and hang clear of the floor, leaving a space under each one so that the entire floor can be swept. Space will not permit us to describe this important improvement in detail. The principals upon which it is constructed will be covered by letters patent. The Chicago Safe and Lock Co. have con for the firm one of the largest safes ever built in Chicago. Our friends who wish to see a copy of our paper when in Chicago, can always find it on file at the Agency of Messrs. Lord & Thomas.

JOTTINGS AT WAHNAPITAE.

A correspondent writes from Wahnapitae to the Toronto *Globe* as follows:—Last September the Emery Lumber Company commenced operations on their limits, five miles north of the C P. Railway orossing at this place, with about 150 men During the winter they took out over 52 000 choice saw logs, driving them in May to the mouth of the Wahnapitae, at French river, close to the Georgian Bay, in four weeks, where they load them on their barge Wahnapitae which is estimated to carry two and a half million feet of lumber, and has this week sailed with a load of three thousand logs for Tawas, Michigan, where their mills are. It is said that they intend taking out double the quantity this season, commencing next month. Jinnings & Gorman have taken out this season over 3,000 pieces of board and square timber from their limits, north of here, which they shipped per C. P. R to Papineauville, on the Ottawa.

McArthur and Brothers this season got out between three and four thousand pieces off their limits south of here mostly board timber, which they run down the river to the Georgian Bay, from thence to the Midland railway; and are going to put in more camps this season. There are men for several firms in the States looking for limits on this river; the last one, from a firm near Chicago, is exploring here, and he says the lumbering capacity of this river, so far as he has seen it is at least 100,000,-000 feet per year.

I am creditably informed that this river gives access to a very large extent of excellent pine land to the north of this, which is all green woods—all of which is not yet surveyed, or sold by the Crown Land Department. As soon as it is opened for sale the Americans say they will be on hand to purchase.

I see the Government has put an export duty on saw logs, I suppose to paevent them being taken to the States to be manufactured in place of Canada. This seems nothing more than just for Canada, as the manufacturing of the logs into lumber on this side will cause much improvement, and villages to grow at places where there is nothing else comparatively to induce such improvements The Americans have two objections to manufacturing lumber here:—First, by shipping by the C. P. R. they will have to tranship in order to get their lumber to the States; secondly, they want a certain rate for a term, say ten years, to secure them against the rate on lumber being raised after they have their mills erected.

I think the C P.R would be consulting their interest as well as the country their line passes through, between South Bay and Lake Superior, by giving lumbermen a reduction equal to cost of transhipment, and for the term of years, as the chances are that in not getting this they will build they mills at the mouth of the rivers at the Georgian Bay, and drive the logs down where they can load on vessels from the mill yard, and so the railway lose the traffic on the only production there is to give them local freight.

PINE PLANTATIONS.

In his official report Mr. R. W. Phipps gives the following account of his personal inspection of pine plantations on the Massachusetts coast :—

All this country around was occupied long ago by the earliest settlers—the men of the Mayflower period. This is the "old colony" of Massachusetts. This rolling land near the sea was rich, was heavily forested, was cleared, cropped and re-cropped, till its fertility was gone. Long lines of ruinous stone fences, centuries old, recall the period when the soil was worth such careful division. Much of it had long lain idle and barren, the home of a few wandering sheep, in great ranges of wind-swept hills and hollows, with, in sheltered places, some growths of oak and poplar. Just here was peculiarly barren. Twenty-five years since one gentleman, Mr. Fay, began to plant pine trees largely, and still more largely to sow their seed broadcast. Many followed his example, and groves sprung up in all directions. There are now more than ten thousand acres of pine plantations, sown or planted, in this vicinity alone, many of them containing trees forty feet in height.

This planting has greatly sheltered and improved the country, and re-settlement—the influx of the class of residents before mentioned—followed fast on the growth of the trees. In one place I was shown what conclusively proved the case of tree planting on hills to hold moisture. "This twenty acres," said one resident, "which, as you see, is high land, when treeless, every spring poured down such floods as filled all the deep gullies around. Now that I have had it for years in groves of pines, the moisture is held in the land, and there are no torrents in spring whatever. The water goes the year round to nourish the creeks." The result of planting in this district is, in fact, that while here twenty years ago was little but a succession of bleak and barren hills, there is now such scenery as my first paragraph described. Nor are the planted groves of small extent. One gentleman, showed me eighty, another one hundred and twenty acres, in one block each, planted by themselves, of rich pine plantations, the trees being 30 and 40 feet in height.

What I want to give my readers an idea of is the way in which this result was secured. Either the seed was sown broadcast on the rough pasture field, or it was sown in the bottom of plough furrows run across the field five feet apart and covered half an inch, or the small pines were taken less than a foot in height and planted with the spade five feet apart each way. These methods have each met with excellent success. The land is a light and rather barren sandy loam, much of the same kind as our poorest Ontario soils. As to the kinds used, they are the Scottish, Austrian, Corsican and our own native white and red pines. Planting and sowing are each done in early spring.

There is no reason why these methods should not succeed in Ontario. Whoever wants a good plantation along the north or west of his lot, or has anywhere—in gully, or field, or hillside—land which gives little return, could not do better than sow it with pine seed. It is easily obtained, easily sowed, and in a few years the annual thinnings will give all the pine fuel he can use, and sticks for many building purposes besides, while as shelter the trees will be invaluable. Words can hardly tell the difference in climate obtained by a thick pine wood along the north and west of a farm. Of course if the planter be disposed to purchase young seedlings—which can be had at less than a cent apiece—he saves some years. But many rough places could be much more easily sown than planted.

James H. Bowditch, Esq., gives the following valuable statistics in reference to these plantations :—

It is here we find the native pitch pines (Pinus Regida)grown from seed almost as easily as the ordinary garden vegetables, the sandy soil and moist atmosphere favoring its early growth. No old planter on the Cape would think of planting saplings ; he invariably sows the seed. Now, where are these plantations, how are they managed, and who are the owners ? Let us begin at the end of the Cape and work south.

A five hours 'drive' from Boston 'on the Old Colony railroad brings you to north Truro, the next town to Provincetown, at the extreme end of Cape Cod. Near here we find twenty different parties whose plantations cover in the aggregate 562 acres, all planted from seed, and all consisting of the common pitch pines, in the various stages of growth, from 1 inch to 15 or 20 feet. As our object is to know just how these plantations 'are cultivated artificially, we will explain briefly in detail.

Ten years ago these well nigh barren and entirely profitless lands could be purchased for 25 cents per acre, now, in the same unimproved condition, they are worth in no case less than $2 per acre ; not a very heavy price you may think, but when a man sells by the hundred acres it makes a difference in the value received. These broad acres have usually no vegetation whatever, save a light growth of the coarse beach-grass, and, in some localities, the low-spreading poverty grass, so-called, and a little moss.

In most cases there is no fencing whatever, a fact greatly to the advantage of the planter in his profit account ; the division line between different owners being frequently a simple plowed ridge. We now have the land for planting.

Just before the first heavy frost, usually the latter part of October, the seed is gathered in burrs, balls or cones (thus variously called) from the pitch pine trees, put up in barrels or boxes, away from mice and squirrels, in a cool place, and before spring they will have mostly opened, when the seeds can easily be taken out. Some people heat them a trifle in the oven to make the seed render a trifle more easily, but it is a dangerous practice, and likely to injure the germinating power.

From one to three-quarters of a pound of clean seed is ample to plant an acre of ground. They may be planted at any time in the year, but probably the best time is early spring, as soon as frost is out of the ground. The method now most generally followed, where from 10 to 50 acres are to be planted, is to run a plough over the whole track, turning a single medium furrow, the furrows being five or six feet apart. A few planters make the distance apart four feet ; a few from eight to ten feet.

The seed is either planted by hand in hills about three feet apart, dropping three or four seeds in a place, and just covering it very slightly with earth, with a hand hoe, or a regular seed planter is used. The latter is probably the easier method, the one most generally practised, and often quite as successful as the more laborious hand planting. A boy may follow after and cover any seed left exposed. I find the cost of planting is variously estimated at from $3 to $5 per acre. The market value for seed last season on the Cape ranged from $1.25 to $1.50 per pound. It takes about a bushel of cones to render a pound of seed. After planting, no further care whatever is given to the area so stocked in most cases. In some places there may be gaps fifty feet long, but these spaces fill up in time of themselves from seeds of the young growing trees. If you hire a team and drive over the country, a look at the various plantations will abundantly repay an interested observer. A fifteen acre piece with trees about three or four years old, said to belong to Mr. Harvey Collins, seemed very thick and thrifty.

Mr. John Henricks has tried the following tree seeds, namely :—White and Norway spruce (Abies Alba and A excelsa), white, Austrian, Scotch and Corsican pines, (Pinus strobus, P. austriaca, P. sylvestris and P. laricio). The experiment was made in this wise : A tolerably good soil was well ploughed and prepared, and seed planted about one quarter of an inch deep. The whole was covered with boards at first, raised slightly when the seeds sprouted. The white and Norway spruce and white pine seeds scarcely germinated at all. The other germinated and grew well, where planted in cultivated land or nursery rows. When planted in furrows or hills in sward land, they suffered from drought, and made but slight growth. Probably not over twenty-one per cent. of the hills are now standing. The Scotch pine did somewhat the best.

In this method of planting forests, whether by broadcast or furrow planting, it is necessary of course, in order to cover the ground, at first to raise far more trees than are ultimately needed, and it has been long a disputed question whether it is best to let a young forest thin itself, the stronger trees killing out the weaker, or whether, after a time, to thin out artificially.

Some gentlemen here are of opinion that it is better to thin by hand. In support of this opinion an interesting illustration is given by the Hon. Levi Bartlett, of New Hampshire In that state a tract had been cleared and burned over in a very dry season, about the year 1,800. It immediately seeded itself with white and Norway pines, and about twenty-five years after came into his possession. He at once thinned out the growth on about two acres, taking over half the number of the smallest trees, the fuel much more than paying the expenses of clearing off. From that time nothing was done with the lot for the next twenty-five years—having sold it, however, during that time. Upon examining it he found that, by a careful estimate, the lot which had been thinned was worth at least a third more per acre than the rest which had been left. It was worth at that time at least $100 per acre. He thought that had the land been judiciously thinned yearly, enough would have been obtained to have paid the taxes and interest on the purchase, above the cost of cutting and drawing out, besides bringing the whole tract up to the value of the two acres which had been thinned out.

At the time when this part was thinned, twenty-five years from the seed, he took a few of the tallest, about eight inches on the stump, and forty to fifty feet high, and hewed them on one side for rafters for a shed. At the next twenty-five years, fifty from the seed, he and the owner estimated that the trees left on the two acres would average six or eight feet apart. They were mostly Norway pines, ten to twenty inches in diameter, and eighty to one hundred feet high. He was greatly surprised seven or eight years after to see the increase of growth, especially the two acres thinned 30 years before. The owner had done nothing, except occasionally cutting a few dead trees. It was now the opinion of both that the portion thinned out was worth twice as much as the other ; not, however, that there was twice the amount of wood on the thinned portion, but from the extra size and length of the trees and their enhanced value for boards, logs and timber. There were hundreds of Norway and white pines that could be hewn or sawed into square timber, from forty to fifty feet in length, suitable for the frames of large houses barns and other buildings. There are some dead trees on the two acres thinned at an early day, but they were only small trees shaded out by the large ones. On the part left to nature's thinning, there was a vastly greater number of dead trees, many of them fallen and nearly worthless. Of the dead trees standing cords might be cut, well dried and excellent for fuel. Estimates were made that this woodland would yield 350 cords of wood, or about 150,000 feet of lumber per acre. Allowing that these were too large, the real amount must have brought a very large profit on the investment.

The opinion of leading planters of trees here of sowing or furrow is that, though not so successful with these, owing to the strong sea gales, as the pitch and Scotch pine, yet that the white or red pine would grow well from seed, by either method, in Ontario. As before remarked, there is much land in Ontario, side hills, waste sandy plains, burnt lands, and so on, where, if successful, the experiment would prove most valuable. If the ground be such as to receive the seeds—that is not a sod or hard clay—broadcast will do ; if harder a furrow is easily made. The shade of surrounding weeds, if not too dense, will not injure—a partial shade, in fact, is always beneficial. Wherever the pine trees are being cut down the large cones could be easily gathered, and put away till spring in a dry place, secure from mice when the weeds will easily drop out. There is no reason why this should not be done over much land, useless now, but which would then, for shelter and ultimate wood, be very valuable.

GATHERING IN SOUTHERN PINE

A dispatch from New Orleans, of July 4th says :—On Monday last 20,000 acres of pine lands were entered in a body in Calcasieu and Vernon parishes in this state by a firm from Grand Rapids, Mich. During the last three or four years western firms, mainly from Chicago and Michigan, have gobbled up all the good pine land in this state and Mississippi. This has been done so quietly that the local saw mill men awoke to the fact that all the good timber in Louisiana had been cornered by Chicago dealers. The fiscal year for the Louisiana land office expired June 30th. From 1882 to June 30th, 1886, no less than 1,150,532 acres of pine lands have been purchased, largely by western speculators and investors. This includes one-fourth of the long-leafed pine lands of Louisiana and about one-half of what the Government owns in the state.

As the land entered is all selected, it naturally embraces the best. What remains unsold is generally of inferior quality and poorly wooded. The purchasers sent surveying parties down here to examine and report on the yellow pine of the south, the quality of the lumber and the value of the land. These reports were favorable and the western men went to work at once buying right and left, but very quietly and without attracting attention. The cost of these initial surveys and selections was only $70 000. The lands themselves were purchased from the Government at $1.25 an acre and probably cost the purchaser altogether not over $2 per acre, making the total cost of these tracts $2,300,000. They will average 10,000 feet of merchantable timber to the acre, 11,500,000,000 in all, or nearly one-half the amount of long-leafed yellow pine in Louisiana. The lumber at the mill is worth $7.50 per M feet, so that the owners of these lands can hope to receive $80,000,000 for their purchase, even if there should be no improvement in the value of their lumber, whidh is highly probable. It will be seen, therefore, that they have made extremely good investments, from which they may be expected to receive handsome profits at an early day.

The system pursued in Louisiana has been similarly carried out in the Mississippi and Texas. In Mississippi western men have bought 775,000 acres of pine lands, and in Texas 900,000 acres. There have been recently large shipments of this southern pine north. Only a few weeks ago 3,000,000 feet of it were shipped on one contract to Philadelphia, while Texas is sending a large quantity to supply Kansas and other prairie portions of the far west. But comparatively little has been done to develope these lands, and the purchasers seem disposed to make no attempt to do so, but to wait for an increased demand for lumber and improved prices in consequence of a smaller supply from the western states, like Michigan.

The recent heavy purchases have been due to the fear that Congress would withdraw the lands from the market and place them among the homestead entries. The investors are accordingly taking up all the best lands so as to secure them before congress passes one general law prohibiting the sale of tracts larger than a few hundred acres. This they have very effectually done, and Chicago, Saginaw and Grand Rapids capital will control the lumber industry of the southwest as effectually as it does to-day the lumbering in Michigan and the west.

Operations on the Saguenay.

QUEBEC, July 17.—Numbers of vessels are loading this year in the Saguenay for the account of Messrs, Price Bros. & Co. The cut of logs in the Saguenay district was very large last winter, and in most of the establishments on the North Shore, operations were conducted entirely on Messrs. Price Bros.' account. In the vicinity of Chicoutimi three hundred thousand logs were cut, and from Grande Baie from sixty to eighty thousand At St. Etienne Bay the cut was over a hundred and twenty thousand logs, the St. Marguerite river, and at Sault au Cochon eighty-one thousand. At the little Bergeronnes, eighteen thousand logs have been cut. The Messrs. Price have also bought the deals produced by the logs cut by the English Company of the Seigniory of Mille Vaches, the site of whose operations is Portneuf en bas.

Chips.

JOHN GILMOUR, lumberman, has been asked to accept the Conservative candidature for Ottawa county, in the stead of Alonzo Wright, the retiring member.

RECEIPTS of lumber at Selkirk, Manitoba, are now considerable, and a large force of men is engaged in unloading barges and piling in the yards.

PACIFIC coast cedar shingles at $4 a thousand and southern curly pine finishing lumber at $40 have invaded the Minneapolis market to the surprise but not the delight of the white pine dealers.

ON July 16th a young man named Hunter White, engaged in taking float wood from the river at Miller's dam, Trenton, Ont., fell off a pier into the slide, through which a drive of logs for the Gilmour Co. was running, and was crushed to death. The body has not yet been recovered. Hunter was 19 years of age and only out from Ireland a few days.

ON July 19th a large party of men reached Ottawa, who had been at work on French river, on the drive of Emmery & Co., who are cutting an extensive limit situated on the tributaries of that stream and shipping to Michigan. They report the drive as a very successful one. Eugene Marcier, the foreman of the gang, though a young man, has for some time been looked on as a first-class man.

THE first through train on the Canadian Pacific railway, from Montreal to Port Moody, which lately made the run, accomplished the distance, 2,875 miles, in 134 hours, or at an average speed of 21½ miles an hour. This is said to be better time than is made on the older transcontinental lines, but not so fast as it is intended when arrangements have been perfected.

MR. R. M. MARCHANT, says London *Truth*, has perfected an engine in which the steam is returned to the boiler, and, so to say, used over and over again. The saving in coal thus to be effected, is calculated at eight per cent. Besides saving coal, this invention will upset a pet theory of the engineering fraternity, who have alway considered this problem as impossible as perpetual motion.

THE Campbellford *Herald* of July 15th says: Rathbun and Gilmour's large drive of logs is still on the move. The tail end is now at Beaver Creek, and will not arrive for about three weeks. It is said to be one of the largest that has ever come down the Trent. Another drive will follow it from the Otonabee river. The drive which passed here last year contained nearly five hundred thousand pieces.

MR. H. P. MCCRANEY, son of Mr. W. McCraney, M. P., was in Vancouver during the first conflagration. He had a narrow escape with his life, and, as it was, lost all his clothes, except those in which he stood. Mr. McCraney having finished a heavy contract on the Vancouver Island Railway, recently purchased an interest in a saw mill in Vancouver city. He was one of the few fortunate ones whose premises were not burned out.

THE Ottawa *Citizen* of July 15th says:—Very few lumber sales are reported of late weeks. The excessive shipping during the early part of the season was owing to large contracts which had been made in advance during the fall and winter by American buyers, who seem now to be fully supplied. A very considerable quantity of three-inch lumber is being put through the saws for a Quebec dealer.

A LETTER from Tadousac, Que., says the cut of saw logs in that section has been very large this year. At Chicoutimi for Price Bros., 300,000 were cut, and Grand Bay from 60,000 to 80,000; 120 000 at l'Anse St. Etienne; 18,000 at Little Bergeronnes and 81,000 at Sault au Cochon. Messrs. Price also purchased the deals from the logs cut for the English company of the seigniory of Mille Vaches at Port Neuf, where they are loaded for the English market.

THE Muskegon *Chronicle* reports Hamilton's mill at that place as having cut 207,909 feet of pine in nine hours, a rate of cutting that would have turned out 230 000 in ten hours. The statement would be more valuable as a record if the equipment of the mill and size of the logs were stated.

THE Menominee *Herald* estimates that at least 80,000,000 feet of lumber will be sent east from the Green Bay mills the present season, of which nearly 50,000,000 feet have already been heard from. The H. Witbeck company have sold 12,000,000; the Bay Shore Company, 12,000 000; Dunham & Avery, 10,000,000, and A. Spies 400,000 feet, all of which will be shipped to the eastern market—mostly to Buffalo, during the season of navigation. Besides the above amounts, the Oconto Lumber Company has sold 25,000,000 feet of its cut to Buffalo parties.

The World's Biggest Raft.

A St. John, N. B., despatch on July 13th says:—The huge timber raft concerning which so much has been said and written, and which is expected to work such a revolution in the timber carrying trade, still lies high and dry on Joggin's shore, at the head of the Bay of Fundy. Albeit it is in a measure ready for launching and has been in that finished state for a month, it cannot start because the tide has not risen high enough and there are legal difficulties in the way. The latter consist in the builders' claim to be allowed for surplus lumber left over after building the raft. It is believed all will be settled by the end of the month.

The raft is now practically completed, only the outside chain fastening remaining to be put in place. This work could be done in a few days. The raft is 420 feet long, 50 feet wide and 36 feet deep. It is shaped like a torpedo and at its largest part has a circumference of 135 feet. Some idea of its immense size may be obtained from the fact that a mile of timber has been used in constructing launchways for it. There are 300 upright timbers to be cut away before the raft will descend on the slides. It is estimated that three days will be consumed in this job alone.

The raft will weigh 7,000 tons. Great interest has been manifested in this new enterprise, people are coming from the United States and distant parts of Canada to study the construction of the raft.

A Drowning Accident.

OTTAWA, July 21.—Additional particulars received of the drowning accident at Booth's mill, an the Lemoine river, state that a jam took place Monday week. The gang went to work to break it up. The jam broke suddenly, and the men made a rush for the banks. All succeeded in escaping except two men, one of whom, named Fred. Whistler, after rushing down with the current for some considerable distance, and being terribly knocked about by the mass of logs, lost his hold and vanished Shortly afterwards, some of the gang succeeded in saving the other man who was terribly bruised and knocked about, and was carried 120 miles to the hospital in this city.

Sawdust as Food for Cattle.

A German gentleman named Frederick William Wendenburg, of Bagenz, Prussia, has made application to the Government of Canada for a patent for a process of manufacturing cattle feed from sawdust or wood meal and other materials and also to have patented the use, application and employment of the same in Canada.

"Hail! Horrors, Hail!"

Is an expression of Milton regarding the "infernal world." It is not too much to say that those who suffer from catarrh would thus express themselves about that disease. Torture and despair mark their daily existence. However, every case can be cured by Dr. Sage's Catarrh Remedy. Its proprietors have for years made a standing offer in all the newspapers of $500 for an incurable case. It speedily subdues all bad smells, is thoroughly cleansing, antiseptic, soothing and healing in its effects.

THE
SECURITY
MUTUAL
Benefit Society
OF NEW YORK,
No. 233 Broadway, New York.

The Security Mutual Benefit Society of New York is one of the few assessment life insurance companies that has attained conspicuous success. "Slow and Sure" has been the motto of its managers, and they have preferred to build up a solid foundation with

Strictly Frst-Class Male Risks,

rather than grow fast numerically at the expense of safety and become burdened with unsafe risks, heavy mortality and frequent assessments.

The members of this society elect their own officers annually, cannot be assessed except for death losses occurring after the surplus fund is exhausted, are guaranteed against dishonest management by the Agency Security and Guaranty Company, a responsible corporation organized upon the unlimited [illegible], and having one hundred thousand dollars capital, and who also

GUARANTEE THE PERPETUITY OF THE SOCIETY FOR 48 YEARS.

Considering the elements of safety and permanency which it affords, no organization ever before offered the substantial benefits of life insurance at so little cost to the insured.

ONLY TWELVE ASSESSMENTS

have been levied from 1881 to 1886, averaging three a year, and making the cost for assessments to a man of 40 years

Less Than Five Dollars a Year

for each $1,000 of insurance.

PETERBOROUGH, Ont., AUGUST 1, 1886.

TRADE WITH AUSTRALIA.

Canada has done a limited trade with its antipodean sister colony, Australia, but there appears to be no insurmountable difficulty in the way of the trade being largely augmented. In order to direct and develope this trade Mr. Alex. Woods has been appointed Agent General from Canada in Australia, by the Dominion Government. Mr. Woods has published a pamphlet on the subject, which contains interesting and valuable statistics and other information. His primary business, he states, is to develope commercial relations with that continent, bring the Canadian producer and Australian importer together, to let the one know the wants of the other, to show the Australian buyer what the Canadian can sell, to advise the Canadian producer as to the styles and character of goods suitable, or which can be made suitable, to the Australian trade, to give such advice or opinion on the commercial standing of the firms proposing to do business, as may be desired, so far as local knowledge may enable him, and thus to assist and increase the ability of the Canadian dealer to compete for the trade and to do so without more than ordinary commercial risks.

Mr. Woods intends to open a Canadian office and sample warehouse in one or more of the principal cities in the Australian colonies. In the office he will keep such information about Canada as it may be possible to supply through maps, directories, commercial journals, etc., and in the warehouse samples of such Canadian manusactures as may be adapted to that country, with price lists of the same in Canada, and such information as to freight and insurance as may be necessary to give the purchaser delivered prices.

During the last year the value of the produce shipped to Australia from Canada was $433,717; from the United States $10,534,138, and from Great Britain the year previous about $134,195,000. The total imports of the Australian colonies—besides what may be called intercolonial—are over $250,000,000 per annum. The Canadian exports to Australia have been comparatively insignificant, but as the lines of goods produced in this country are much the same as those of the United States, and as many of the lines of goods sent there from Great Britain can be produced here, the trade, especially with the facilities now and about to be provided, should be largely increased.

To give a clearer idea of what may be done we will quote some of the statistics furnished. During the year ending June 30th, 1885, the value of the exports from Canada to Australia were as follows:—Coal, $110; stone, $120; canned salmon, $57,571; pickled salmon, $23,622; spruce logs, $40; deals (pine, spruce and end), $13,815; lath, $15,915; planks, $155,036; scantling, $433; other lumber, $1,532; masts and spars, $140; agricultural implements, $256; books, $84,591; machinery, $32,063; sewing machines, $31; hardware, $379; boots and shoes, $50; organs, $8 350: pianos, $250; ships, $31,000; doors and sashes, $1,300; other manufactures of lumber, $100; other articles. $7,023. The following are the values of some of the goods exported from the United States to Australia:—Agricultural implements, $244,310; ashes, $40,273; dried apples, $80,028; green apples, $37,246; blacking, $25 263; books, etc., $124.940; boots and shoes, rubber, $48,422; boots and shoes, leather, $367; beer and ale, $74.385; carriages and horse carts, $388,331; casings for sausages, $90,633; cordage and twine, $26,138; clover seed, $31,198; cotton goods, colored $3,047; cotton goods, uncolored, $45,662; fish, $82,950; canned fruit, $102,504; harness and saddlery, $31,820; all sorts leather, $216,497; lamps, etc., $73,961; locomotives, $140,000; stationary engines, $9,205; boilers and parts of engines, $5,675; other machinery, $576,475; organs, $138,918; pianos, $10,863; nails and spikes, $19,073; lard, $12,201; whale and fish oil, $51,664; naphtha, $30,233; illuminating oil, $912 986; lubricating oil, $39,587; railway cars, $86 514; roofing slate, $44,950; refined sugar, $601,568; saws and tools, $360,879; scales, etc., $14,532; sewing machines, $129,524; stoves, ranges and parts, $45,019; tinware, $9 382; tobacco, $1,044,134; trunks and valises, $19,010; onions, $5,848; peas, $1,009; canned vegetables, $8 443; boards, deals and planks, $840.132; joist, lath, paling, boxshooks, etc., $83 967; doors, sashes and blinds, $156,516; mouldings, trimmings and other house furnishings, $62,071; household furniture and other woodenware, $622,100. Of the exports from Great Britain to Australia the following might be noted:—Boots and shoes, leather, $3,665,000; beer and ale, $5,520 000; cotton goods, $9.260,000; harness and saddlery, $645,000; machinery and mill work, steam engines and parts thereof, $538,764; other machinery, $846 042; paper, writing, printing and enveloped, $546,813; other paper, $102,046. Mr. Woods is of opinion that a market for some kinds of farmers' produce may be found in Australia, including oats, butter and eggs.

The completion of the Canadian Pacific railway and the projected steamship line on the Pacific Ocean, with the establishment of the Canadian agency in Australia, will afford facilities for trade that Canada has not heretofore enjoyed, and the development of the Australian trade may be looked for. The railway has already been used for making shipments of machinery to British Columbia, Peterborough being among the first to do so, and the line will be of greater value with the steamship connection.

Mr. Woods intends visiting the principal business centres throughout the country, previous to departing for Australia in the latter part of September, and in the meantime correspondence addressed to him at the Windsor hotel, Montreal, will be forwarded.

HOW IT WORKS IN ONE CASE.

IT appears that the export duty on logs is already beginning to bear fruit, and the apples are dropping into the Canadian basket. The Bay City *Gazette* says:—

"How the increase of the export duty on saw logs by the Canadian Government will operate in one case is told by F. E. Buswell, of Grand Rapids: 'We own 100,000,000 feet of pine, standing on Spanish river on the north shore of Georgian Bay, and we will work it up right on the spot.' said Mr. Buswell. 'We thought at one time we could ship the logs to our Grand Haven mills as raw material, but we have since come to the conclusion that we can better afford to manufacture on the Canadian shore and ship the lumber and pay duty. We will only have the duty to pay. Cutter & Savage, of Grand Haven, own 100,000,000 feet on the Spanish river, and Saginaw and Bay City men own a lot more. We will probably buy another lot this winter. We intend this year putting in about 15,000,000 feet of logs, and already have our men at work.'"

This is just what the advocates of the increase of the duty argued—that the United States dealers would not export the logs when they would not save duty by so doing, and that in consequence the lumber would be sawn in Canada and this country would reap the advantage incident to its manufacture. The advantage to the country will be considerable. Men will find employment, farmers will find a market and money will be circulated in the country that would otherwise go to pay workmen in the United States.

The principal advantage to the Canadian lumbermen will be, that although there may not be less lumber sent to the markets—and there probably will be less—the United States dealer who utilizes Canadian timber will not have to pay less duty than the Canadian dealer. Our United States contempories persistently ignore this feature of the case, but it is an important one to Canadians.

Again, it was argued that the increase of the export duty would stand in the way of the successful negotiation of a reciprocity treaty, or the removal of the United States import duty on lumber. The way the export duty works in the case cited by the *Gazette* does not bear out that objection. The United States duty would have been removed ere this but for the influence of the United States lumbermen, and when it becomes in the interest of these dealers to have the duty removed it will then go. As soon as they begin to saw lumber on this side of the line it will be to their interest to have the duty abolished, and the chief influence that now maintains that duty will then be on the other side of the question.

MORE FIGURES.

A SHORT time ago some figures were quoted in the CANADA LUMBERMAN from the Bay City *Gazette* as to the quantity of logs United States lumbermen proposed to carry across the lakes in the rough. The *Gazette* then said that one Saginaw firm only intended to export logs, and only 12,000,000 feet, and Alpena people probably 12,000,000 more, which caused it to come to the conclusion that the export duty was silly. In its issue of July 16th, however, it says:—

"The Emery Lumber Company having invested in 100,000,000 feet of pine in the Spanish river region of Ontario, propose to bring the logs to this district—their mill be at East Tawas—to cut, if they have to pay the $2 export duty. At any rate they propose to see if there is any money in the business."

Besides, the *Gazette* says that F. E. Buswell, of Grand Rapids, owns 100,000,000, and "Saginaw and Bay City men a lot more." Of course the export duty was a trifling matter—unnecessary, silly! And the fact that one of these firms has decided to manufacture the lumber on the Canadian side, instead of exporting the logs in the rough, only shows still more plainly how intensely silly the increasing of the export duty was! Probably Canada could stand more such silliness without a collapse, and perhaps the United States will see that reciprocity would not be such a bad thing after all.

Supposed Wreck.

CHICAGO, July 21.—Captain Roach, of the tug Morford, yesterday picked up in the lake, of Kenosha, the pilot house and poop deck of a lumber barge. The house was painted red and on either side of it were the letters "S.S." but Captain Roach was unable to trace the rest of the name. In the pilot house he found the wheel intact, and took it aboard the Morford and will bring it to Chicago. It is feared some vessel with her crew has gone to the bottom.

THE MONTANA FORESTS.

The bill establishing a national forest reservation in the Rocky Mountains of Montana ought by all means to become a law at this session of Congress. It was passed by the Senate last week, as it was by the same body in the previous Congress, when the House failed to reach it. The proposed reservation includes the headwaters of two of the greatest rivers of this continent—the Missouri and the Columbia—and their tributaries. No settlement will be allowed on the reservation, and no one will be permitted to cut timber. This measure involves the prosperity of vast agricultural regions, and thus is truly national in purpose. appealing to the interests of the entire country. If these forests should be destroyed the damage would be incalculable through the washing away of valuable arable land, and the injury to the streams by shoaling, and to their adjoining country by increasing the danger of floods, which are becoming more serious year by year. It may easily be seen how every community, from Montana to the Gulf of Mexico, is directly interested in the passage of this measure.

On the other hand, if the forests are preserved, an equable flow will be maintained in the streams, to be utilized in the irrigation of vast tracts, otherwise useless for agriculture on account of the light rainfall. In this way the land would become available for cultivation by the most certain methods in existence. With irrigation crops never fail, and thousands would find homes where now there is a desert. Therefore, the House should not again neglect to pass this bill, if it desires to perform a duty which will result in the extension of the agricultural area of the country, increasing the population of the Northwest, and promoting every interest connected with the food supply, from the great railway companies which transport it down to the immense multitudes who consume it.—*Boston Herald.*

BUSH FIRES.

The Manitoulin *Expositor* says:—Bush fires continue to rage in many parts of the island, particularly on the south shore in the vicinity of Michael's Bay and Providence Bay. The losses in many cases are serious, some farmers losing everything. The bridge and crossing between Michael's Bay and Providence Bay are reported burnt. James Kendrick's shingle mill, shingles and timber have been destroyed. R. Batty lost his house, barns, implements, fences and some sheep. John McKechnie lost his barns; Hugh Rennie, a house; Sam Sinclair, house, barns and implements. The M. B. L. Co.'s barn on Manitou river is burned. The fire is very close to Michael's Bay. A. W. Trewin's (until lately, Bowlers) mill is reported in danger. Unless rain comes soon, much more property will be destroyed. Trewin's mill is reported to be burnt.

The Parry Sound *Star* of July 23rd says:—Two or three small bush fires have already broken out in this neighborhood, but have fortunately been quenched by the recent showers before they had done much damage. We would remind our readers in this district that it is a misdemeanor to set out fire during this season of the year, and that it is attended with great danger, as a fire once fairly started in the woods is very difficult to control and may do immense damage. Campers on the islands, too, should be very careful in making their camp fires, first to select a place on which to build their fires where there is no danger of spreading, and then to carefully extinguish every spark before leaving it. A little care during the next two months will prevent the destruction of much valuable property. We hope that any person caught carelessly putting out fire will be promptly made an example of.

THE New York *Lumber* says:—While the metropolitan lumber trade is devoid of life, as it generally is during July and August, it may safely be assumed that the outlook for the fall trade is quite promising. We expect to see the trade booming about September.

SUMMERS, Smith & Summers, lumber merchants Toronto, have assigned. Liabilities, $19,000; assets $18,000.

TREE CULTURE IN THE WESTERN STATES

We had a visit yesterday of Mr. G. E. Brown, from Larchwood, Lyon Co., Iowa, who, with Professor Brown, of the Ontario Experimental farm, had been at the funeral of their father, Dr. Brown, of Port Elgin, the well-known British authority on arboriculture. Mr. G. E. Brown is practical forester to Mr. R Sykes, an English gentleman of wealth, who possesses 22,000 acres in the State of Iowa, 30 000 in Dakota, and 60 000 in Manitoba, almost all prairie. A work of great importance is being conducted at the former place, under Mr Brown's management. Mr. Sykes is adopting the share system of farming with settlers, usually in quarter sections (160 acres) for each family, houses being built, and the annual seed provided in return for one half the proceeds of the grain crops, which are principally flax, corn, wheat, oats and barley. Perhaps the most important feature of the extensive improvements being carried out is the clothing of the prairie with plantations. Already, in two years, there is a nursery of 20 acres devoted to the rearing of forest trees, from the seed bed as well as by selection from other parts of the States and importations from Britain. Mr. Brown has on hand now about 2,000 000 plants preparing for next year's operations. In systematic order they propose enclosing and planting clumps, belts and various sized plantations for the purpose of shelter, and directly remunerative results from sales of thinnings. The kinds of trees being tested are spruce, Scotch pine, larch, white pine, soft maple, white ash, box elder, European sycamore, mountain ash horse chestnut, birch and catalpa speciosa. An enterprise of this kind cannot fail in immense practical national benefits, and that very soon. Mr. Brown is but recently from Scotland, having been engaged there by Mr. Sykes to superintend the tree culture solely.—*Guelph Mercury.*

AT THE COLONIAL EXHIBITION.

The following notes are taken from a letter the Montreal *Gazette's* correspondent at the Colonial Exhibition in London :—

NEW BRUNSWICK WOOD TROPHY.

But the most distinctive feature of the whole of the central gallery is the admirable trophy of the New Brunswick woods. It has been my advantage to see many exhibitions, and I can without hesitation say that one so compact and yet so complete is variety and beauty can rarely be seen. The trophy has already been described in detail by the Canadian press. Suffice it to say that it embraces all the larger or commercial woods that are sufficiently abundant to form an important item of trade, as well as many smaller woods. The object of the display is being well accomplished. It arouses much enquiry as to the woods themselves and the manufactures made from them, and should largely assist in opening up extended markets hear for the wooden manufactures of New Brunswick. The painting of the fruit, foliage and flowers of each variety appearing on the panels, has aroused general admiration such as would be gratifying to the artist, Mr. John C. Miles, A. R. C. A., could he but hear it For the design and construction we have to thank, among others, Messrs. J. & J. D. Howe, of St. John, N. B., and Mr. Ira Cornwall, the agent for the province at the exhibition.

CANADIAN FURNITURE.

It is well arranged that, close to the commanding British Columbian pine trophy and to the neat wood display of New Brunswick, the Canadian furniture exhibit should be shown. Messrs. Toes & Co., of Montreal, have an excellent collection of writing desks and revolving bookstands full of ingenious devices. The desks are highly finished and have attracted so much notice on account of their ingenuity and comparative cheapness, that a large demand is anticipated from this side. Messrs Simpson & Co., of Berlin, Ont. ; Messrs. Stewart & White, of St John N B., and Messrs. McGarvey & Son, of Montreal, also have excellent furniture exhibits. It is true that in designs some of the goods do not affect the latest London and Parisian fashions, but in neatness, symmetry and finish they leave little if anything to be desired.

PORT OF QUEBEC.

According to a table published in the Quebec *Chronicle* in 1885, the total number of vessels which were reported inward reached 268 vessels. 283 081 tonnage, and 6 465 men. In 1886 the figures show 208 vessels reported inward 230,509 tons and 5 446 men,—a decrease of sixty vessels In 1885, there were 124 British ships and 144 of foreign origin which arrived in port, while in the present year, the number of British vessels was 96 and of foreign ones there were 112. For 1885 the returns show, besides 124 British. 136 Norwegian and Swedish, five German, one Russian and one Dutch In 1886 the returns stand thus : British 96 ; Norwegian and Swedish, 103; German, 4; Russian, 2; Dutch, 1 and Argentine Republic 2.

With regard to the showing of vessels outward bound, we find that in 1885, the total number which left Quebec amounted to 190, tonnage 182 711, men 4,154, and in 1886 the number of vessels was 153, tonnage 143,978, men 3,491. These latter belonged to the following countries : British 79, Norwegian and Swedish 104 German 4, Russian 1, Dutch 1, Argentine Republic 1. They were despatched to the following ports, viz. :—United Kingdom 125, British Colonies 15 and other foreign countries 13.

Forest Fires in Michigan.

TRUFANT, Mich., July 23.—Forest fires are raging around this place and the citizens are fighting the fire to prevent the destruction of the town. The air is blue with smoke and great danger is apprehended

SHELBY, Mich., July 23 —Forest fires are burning through Benona and Golden township, "Ocean" county, and the air for miles is filled with smoke.

HART, Mich., July 23.—Terrible fires are running through Juddland Place and their roaring is heard a long distance. The depot, fair ground and lumber yards are in danger and probably will go. A large force of men are out fighting the fires and the village is greatly excited.

Destructive fire.

STANTON, Mich . July 15 –A destructive fire occurred at Fish Creek, five miles east of here, yesterday afternoon. It originated in Wagar's lumber yard, adjacent to his mill, and soon licked up about 5,000 000 feet of lumber, over 4,000,000 shingles and a large amount of lath, tramways and everything about the mill The mill was all that escaped. Loss, about $80 000 ; insurance about $50 000. A high wind prevailed at the time and the fire was carried into the woods south and is still raging there, and is likely to do great damage yet. Ten cars standing in the lumber yard, were burned

THE Port Arthur *Sentinel* says :—Messrs. Vigar Bros applied to the council on Monday night for a lease of the ground on Water street, formerly occupied by Jerrett's planing mill. If the lease was granted at terms suitable to both parties they intended to proceed with the erection of a portable saw mill The Committee of Works recommended that the lease be granted if within the power of the council, from year to year only, without confering any permanent rights or privileges The council on motion of Councillors Margach and Meek, referred the application to the solicitor.

THE New York *Luwberman* has changed proprietorship and appears with a new name *Lumber*. It is now published by the *Fanancier* Company. It is a sixteen page paper, and contains a large quantity of interesting and instructive reading regarding the lumber trade, and columns of reports. It contains the elements of success.

THE Muskegon *Chronicle* reports Hamilton's mill at that place as having cut 207,909 feet of pine in nine hours, a rate of cutting that would have turned out 230,000 in ten hours. The statement would be more valuable as a record if the equipment of the mill and size of the logs were stated.

MISCELLANEOUS.

During a violent thunderstorm which recently broke over a country town in France a curious incident happened. A young women caught in the storm was hastening homeward, sheltering herself as best she could beneath an umbrella from the dranching rain. Suddenly she experienced a strange and alarming sensation, the shock being simultaneous with a very vived flash of lightning. She felt "quite upset, greatly alarmed" by it, nevertheless, prodceeded on his way, and it was only on reaching her residence that she discovered what a narrow escape she had had. On removing her bonnet she found that her hair had been literally cut off, having the same appearance as though it had been shaved with a razor. The effect upon the girl's mind of the discovery was so great that she has been confined to her bed ever since the day of the storm. It is not the loss of her hair that affects her, but the recollection of the narrow escape she had has so entirely upset her nervous system that the medical men attending her express the opinion that it will be some weeks before she recovers from the shock. — *London Standard.*

MONTREAL, July 27.—The street decorations in connection with to-day's ceremonies were very elaborate. The banquet at the Seminary Hall this afternoon at which Cardinal Taschereau, Archbishop Fabre, Mgr. O'Bryan, Papal ablegate, and about 350 prelates and clergymen sat down, occupied an hour and a half. No toasts were proposed. After the banquet the Cardinal and party proceeded in carriages to the city hall, escorted by a number of the calvacade dressed in costumes of Louis XIV., where a levee was held at 4 o'clock. An address was also presented to the Cardinal from Laval University. The city hall was profusely decorated, opposite the mayor's throne in the council chamber being the arms of the Pope, Cardinal and Archbishop Fabre. The city was illuminated to-night, and a display of fireworks in Dominion square took place.

OTTAWA, July 26.—During the heavy thunder storm which passed over here last night three men were standing at the entrance of the Dowling House at Hull, when the lightning struck them. One of them, named Joseph Tremblay, had the sole of his boot torn off, but his foot was unharmed. Another, named Pierre Bedard, was so affected by the shock that he fell into a fit, which lasted three hours. He has not yet quite recovered from the effects. The electric fluid then ran into the house, struck the stove, ran up the chimney to the roof and displaced a large number of shingles. In another house Adolphe Laferriere, while leaning against the stove, was struck in the back and received a severe shock.

VICTORIA, B. C., July 27.—The first tea shipped passed Victoria yesterday on the way to Burrard Inlet. The general feeling is that it is fitting that its arrival should take place almost at the same time as Sir John's first visit.

PANAMA, July 26.—It is understood, though not officially proclaimed, that Senor Balmacedo, Liberal, has been elected President of Chili. The elections were attended with great bloodshed. Upwards of 40 lives were lost.

Belshazzer's Warning.

"Tried in the balance and found wanting," is the general verdict rendered against most of the so-called cures for lung troubles. Such a decision has never been given against Dr. R. V. Pierce's "Golden Medical Discovery." On the contrary, it is conceded by thousands who have tried it, to be the only remedy for consumption (scrofula of the lungs) and scrofulous diseases generally. It will not cure when both lungs are most gone, but if taken when the disease is in the first stages it never fails It is also specific for such scrofulous affections as fever-sores, white swellings, hipjoint disease, and great eating ulcers, and for blood taints generally, from whatever cause arising. By druggists.

West's World's Wonder or Family Liniment is a remedy that no well regulated household should be without, as it is a positive cure for Rheumatism. It is invalueable for Sprains, Cuts, Bruises, Burns, Scalds an all diseases requiring external application. rice 25 cents and 50 cents per bottle. Sold by J. D. TULLY

Wanted.

THREE HUNDRED THOUSAND feet of dry inch basswood culls.

BELDEN & McDOWELL,
Syracuse, N. Y.
3m14

TIMBER LIMITS.

TENDERS for timber limits on [illegible] Muskoka, Black and Trent [illegible] 270 square miles, containing [illegible] pine; also for four saw mills on Black and Trent [illegible] September, 1886.

Terms apply to J. D. SMITH, or the [illegible] or Port Hope, Canada.

For Sale at a Sacrifice.

A SAW MILL

SITUATED in excellent locality with an attachment of 200 acres of well timbered land through which flows the Nottawasaga river. Best water privilege in Simcoe. Capacity of mill eight th usand feet daily. Enough custom work to pay running expenses Satisfactory reasons for selling, Box 60, Allston, Ont. 2m13

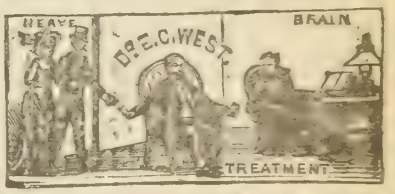
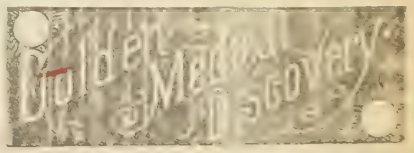
Health is Wealth!



Dr. E. C. West's Nerve and Brain Treatment guaranteed specific for Hysteria. Dizziness Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness. Mental Depression, Softening of the Brain resulting in Insanity, and leading to misery, decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each bottle received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY, Druggist, Sole Agent for Peterborough.



Thoroughly cleanse the blood, which is the fountain of health, by using Dr. Pierce's Golden Medical Discovery, and good digestion, a fair skin, buoyant spirits, vital strength, and soundness of constitution will be established.

Golden Medical Discovery cures all humors, from the common pimple, blotch, or eruption, to the worst Scrofula, or blood-poison. Especially has it proven its efficacy in curing Salt-rheum or Tetter, Fever-sores, Hip-joint disease, Scrofulous Sores and Swellings, Enlarged Glands, and Eating Ulcers.

Golden Medical Discovery cures Consumption (which is Scrofula of the Lungs), by its wonderful blood-purifying, invigorating, and nutritive properties. For Weak Lungs, Spitting of Blood, Shortness of Breath, Bronchitis, Severe Coughs, Asthma, and kindred affections it is a sovereign remedy. It promptly cures the severest Coughs.

For Torpid Liver, Biliousness, or "Liver Complaint," Dyspepsia, and Indigestion, it is unequalled remedy. Sold by druggists.

PIERCE'S PELLETS — Anti-Bilious and Cathartic. 25c. a vial, by druggists.

AUSTRALIA.

Messrs. Lord & Hughes' monthly circular, dated Melbourne, June 12th says :—

Our last circular was under date 15th May, since which the trade has been steady, with no appreciable change in prices of any description of timber. The arrivals of Baltic, flooring and Oregon have been heavy, as also have been slates, which are in a very depressed state.

Trade from the yards show a slight falling off.

Red Deals.—Imports: 7,761 pieces. These arrived per the Dingadee, from Sydney, and were sold privately. Price not transpired. The Elizabeth's cargo was sold on the 8th inst., D O M brand realizing for 11x4, 9x4, and 11x3, 6d to 5⅝d; 9x3, 5½d to 4⅝d; 9x2½, 5 1 16d to 4¾d; 7x2½, 4⅝d to 4¼d all per foot of 9x3. Good quality Joiners' deals are in demand, but inferior fourths are difficult to quit.

Spruce Deals.—Imports: Nil. The Howard's shipment was sold on 25th ult., 11x3 realizing 4 1-16d, and 9x3, 2¾d to 2⅝d.

Oregon Timber.—Imports: 2,626,320 feet super. The arrivals have been Emerald, from Puget Sound; Thomas R. Foster from Burrard Inlet; Nicoya and Hesper from Port Townsend. The Thomas R. Foster's cargo has been sold privately; price withheld. The Fresno's cargo was sold on 4th inst., at from £5 7s 6d to £4 10s—average £4 18s 6d per 1,000 feet super, which is an advance on last sales.

Lumber.—Imports: Clear pine, 24,535 feet super; shelving, 41,123 feet super. The only arrival during the month has been the Samar, from New York. Sales of sundry shipments were at prices ranging for clear pine, £13 17s 6d to £13 10s; shelving, £10 5s to £10 per 1,000 feet super.

Flooring and Weatherboards.—Imports: 5,944,652 feet lineal. The arrivals have been —Mentone and Apollo, from Frederickstad; Northern Monarch, from Montrose; Don and Falkland Hill, from Glasgow. Sales have been made of shipments ex Howard, Inchgreen, Aurora, Celer, Palawan, Lorelei, Fritzoe, Falkland Hill, &c., at the following rates:—Baltic Red, 6x1⅛, 9s 6d to 8s 9d; 6x⅞, 7s 7d to 7s 3d; 6x¾, 6s 9d to 6s 6d; 6x½, 4s 10d to 4s 7d; 4-out 5s to 4s 10d. Baltic white, 6x1⅛, 9s 9d to 9s 3d; 6x⅞, 7s 6d to 7s; 6x¾, 6s 3d; 6x½, 5s to 4s 8d; 4-out, 5s; last month's rates being fairly maintained.

Kauri Pine.—Imports: 284,948 feet super. The arrivals have been—Peerless, from Wangaroa, and Clansman, from Mercury Bay. The balance of the Parnell's cargo was sold on the 8th inst., at a reduction on lastt quotations. The Peerless cargo is advertised for sale on Tuesday next.

Pitch Pine.—Imports: Nil. The shipment ex Sarah Hignett was sold on 21st ult, wide clear shelving realizing £10 12s 6d, 10-inch T. and G., 6s 6d per 100 feet lineal.

Cedar.—Imports: 244,700 feet super. The arrivals have been the Thyra, from New Guinea, and per coasting steamers from Sydney. The Thyra's cargo was sold on the 8th inst., at 28s to 14s 3d per 100 feet super; prices satisfactory considering the quality.

Doors.—Imports: 1,209. This parcel arrived ex Sydney steamers, and came to the order of the trade.

Laths and Pickets — Imports: Laths, 7,943 bundles. The arrivals are Emerald, Thomas R. Foster, Nicoya, and Hesper, from Oregon ports; Northern Monarch, from Montrose.

Slates.—Imports: 572,457. These arrived ex Wellington, from Tasmania; Samar, from New York; British Ambassador and Glenricht, from Liverpool. A small invoice of 20x10 American blue Bangor, ex Sarah Hignett, was sold on 21st ult at £7 per 1,000. Stocks heavy.

Plaster.— Imports: 500 barrels. This shipment arrived ex Samar, from New York. The only sale by auction has been a small lot of 50 barrels Albert brand, at 14s 6d per barrel of 400 lbs.

Cement.—Imports: 11,651 barrels. A line of 175 casks, Atlas brand, was sold on 25th ult., at 7s. 9d to 7s 6d per cask. Privately, sales have been made of Gibb & Co.'s Portland, at 9s 6d.

Galvanized Iron.—Imports: 960 tons. An invoice of Two Cones was offered on the 8th inst.; but bidding not being up to limits its wa withdrawn. Privately, sales have been making at full rates, a small invoice of Queen's Head having been placed at £17.

Explanation.—Red deals and spruce are sold at per foot of 9x3; T. and G. flooring at per 100 feet running; Oregon timber, redwood, clear pine, shelving, ceiling, per 1,000 feet super; Kauri pine and cedar logs at per 100 feet super; laths, pickets and slates at per 1,000 pieces. Shorts are all lengths under 12 feet.

CONSTRUCTION AND ARRANGEMENT OF SHAFTING.

The construction and arrangement of shafting, the great prime factor in transmitting power from the motor to the machinery of any establishment, is a matter of perhaps more importance than anything else in the arrangement of the plant, and because of the very high rate of speed necessary and the secure and sudden strains to which it is subjected, it is perhaps of more importance in a saw-mill than in almost any other wood-working establishment.

I recognize the fact that in this country the construction of shafting has received such attention from practical men, that the great problem has been worked out until the proper construction and plans of construction has been reduced to a perfection not attained in any other country.

In the construction of a modern saw mill in which will be used the various lumber producing machines of the present day there are three things to be considered with reference to the shafting, viz., size, strain and speed.

As regards the speed of the main-shaft I hold that the higher the rate of speed made consistent with good results the more economical is the operation of the machinery. In support of this theory I ascribe the reasons, that a high speed main-shaft will avoid the use of numerous counter-shafts, or the putting of very small driving pulleys on the various machines, and the reduction of power to the lowest possible minimum by direct connection; I do not hold, however, that the rate of speed of the main-shaft should be sufficient to give motion by direct connection the light machines, that require a very high speed to successfully operate, for all such should have an independent counter-shaft properly speeded to give the required speed to the machine.

Shafting should always be true, turned to a gauge and snugly fitted in bearings or boxes, having both vertical and lateral adjustment, and provided with the proper means for lubrication. The use of cheap shafting is the poorest economy. The advanced price for high grades, especially for Bessemer steel, will be found a good investment.

There are two important advantages to be gained from the use of steel over iron; the first is that steel shafts are stiffer than iron and may therefore be smaller, and the second is, they will run with less friction, because of the fact that the iron usually employed in the manufacture of shafting is seamy and otherwise unsound.

In saw mills when the speed, number of pulleys, and belt tension is excessive, the tortional and tending strains on a line shaft are very great, and should be borne in mind when making calculations as to the diameter of shaft necessary, and the centre to which the bearings are fixed.

There is no positive rule for finding the diameter of shaft required, but the following well-known and universally adopted one, is approximately correct, in determing the diameter of a wrought iron shaft capable of transmitting a certain or given horse power.

"Multiply the given horse power by 125 and divide the product by the number of revolutions per minute, the cube root of the quotient will be the diameter in inches." In order to attain the best results, experienced saw mill builders have found it advisable to add 15 per cent to the results thus obtained.

It has ever been a question of opinion with individual builders as to the size and length of the first section of shafting or that which receives the power direct from the motor. That it should be of greater diameter than the remainder of the shaft, common sense would prove, but how much larger, is as yet undecided by any fixed rule. Experience demonstrates that 1-6 to 1-16 larger is practical. In making a calculation as to the diameter of this section prudence would suggest the advisability of erring, if at all, on the side of st ength, for a bind or spring would necessitate stoppages for truing and lining up, that would very soon amount to much more than the increased cost of a larger shaft.

The distance between bearings should be very much less on this than on the other sections. In no case should they be further than five or six feet apart from each other. And in case of very great power a bearing should be placed on either side of the pulley receiving the power.

In fixing shafting the first important principle to be observed, is to have it perfectly level, which is obtained by the use of a straight edge and spirit level The straight edge should rest in the bearings and they should be packed until the spirit level stands perfectly true, after which the shafts should be trued with the level in various places. A very great mistake is often made by setting shafting with the walls of a building, which oftimes is out of true, and occasions stoppages that could otherwise be avoided. Care must also be taken that the pulleys on the main shaft and the machine pulleys, or the pulleys on the counter-shaft, are in line; there are two ways of lining these pulleys, one is by the use of a straight edge made to bear evenly on the edges of the driving pulley and setting the other pulley to it, so that its edges bear easily; or if the pulleys are a very great distance apart a plain line may be used in a similar manner.

In setting the shafting of a complete plant it is a saving of time to work very slowly. A ground plan should first be drawn, the locations of each machine marked thereon, taken its required speed and the speed of the line shaft and determine the size of the driving pulleys required. There is much disagreement as to which should be placed in position, first the the main-shaft and its connections, then the engine lined to it, or first set the engine, and line the shafting from it; both theories can be supported by almost convincing argument. Were I engaged to put up the shafting, and set the machines and engine, I would certainly put up the main-shaft and all its connections first, after which I would set the engine. My reason or so doing is that it is very much more practical to place a long main shaft parallel with the timbers of a building and set the engine afterwards to line, than vice versa.

In wood-working establishments whenever possible the main-shaft should be fixed under the machines to be driven and at an angle, if possible of 60° to 75° as it increases the driving power of the belt.

The connections are also out of the way of the operation and can be easily and securely boxed.

If it be possible in the arrangement of the machines to so locate them that they will be on either side of the driving shaft, the strain is thus equalized as the belts will pull in both directions.

Under no circumstances would approve of toothed gearing for saw mill purposes; because of the fact that toothed gearing requires more power to produce the same results, it becomes rapidly worn, producing more or less vibration, and necessitates frequent repairs.

When it becomes necessary to run a shaft at an angle from the power producing shaft, a belt connection led over guide pulleys is cheaper, less noisy, requires less power, and if well arranged will produce better results with fewer repairs than any other plan.

To make this connection properly requires the exercise of a mechanical calculation more difficult than at first thought would appear. The best plan is to mount the idle pulleys on a spindle fixed vertically in a ball and socket seating, which may be fitted in a bracket attached to a hanger or standard by prolonging the end of the spindle and fitting it with a screw, serated washer and nut. The spindle and pulley may be set at any angle.

The spindle carrying bracket should be so arranged with a vertical adjustment in the hanger or standard. The ball segment of course can be turned around as necessary and with the above plan the idle pulleys may be adjusted to suit any position of shaft, thus obviating the construction of a special set of hanger or bracket patterns for each separate case, and at the same time ensuring the correct running of the belts main pulleys.—*Saw Mill Gazette.*

GATINEAU DISTRICT.

The Ottawa *Journal* of July 20th says:—Ex-Alderman Samuel Bingham has just returned from River Desert, where has been engaged in superintending the timber drive from that place to the Gatineau boom at the junction of the Ottawa and Gatineau rivers.

Mr. Bingham states that the crops up the Gatineau as far as Desert are in a very good condition, but have been slightly injured by the late rains. He also stated upon being asked whether there was any truth in the rumor reported in several Montreal and one Ottawa paper in regard to a murder said to have been committed in those regions that the people of the Gatineau district were much surprised when he mentioned the fact, and that the people of Montreal and Otttawa seemed to know more about the matter than the people living in the district where the murder was supposed to have been committed.

Mr. Bingham stated that the timber drive was progressing very favorably, much better than was expected, as the late rains had kept up the water in the river, thus preventing the logs from sticking on the rocks and causing jams. Mr. Bingham expects, if the water does not fall, to have the tail of the drive into the Gatineau booms by the 15th of August.

WOODEN TURBINES.

Wooden turbines have of late been proposed to meet the demand for an efficient and cheap water motor for small powers, and there is every reason to believe that within certain limits they will meet with a very favorable reception. Turbines, it must be remembered, have the advantage of being small in bulk for their power, and equally efficient for the highest and lowest falls, and were it not for the fact that they are constructed wholly of metal their use would probably have long since become more general. Wooden wheels can in some cases be readily procured at a comparatively low price, and, as the question of first cost and ease of repairs enters very largely into the problem of successfully utilizing small water powers for some purposes, and is of greater importance than a high efficiency, turbines have often been unable to compete with wheels of other types. This state of things, it is thought, can be changed by using wood as the structural material, thus securing the advantages of turbines without they drawbacks, and it has been found that in this way their cost can be reduced to about one fourth of that of iron turbines. In some parts of Europe wheels of this class have been constructed partly of oak and partly of yew, and the results are understood to have been highly satisfactory in every respect.—*Carpentry and Building.*

Forest Fires.

Muskegon, Mich., July 17.—For the past twenty-four hours this city has been enveloped in smoke from fires in the surrounding forests. It is impossible to see any distance at all, and if it were not for occasional puffs of air from the lake, the atmosphere would be almost suffocating. There has been no rain for weeks and no sign of it The crops are suffering severely. From all quarters come reports of extensive forest fires. The farmers about Twin Lakes, Holton, Whitehall and North Holland have been battling with the flames for days, and many of them have been obliged to move their families and household goods on account of the threatened danger!

John O'Neill, a river man, was with a companion rolling a log off a rock in the Snake rapids, when the stick swung around and knocked both into the water. The other man swam ashore but O'Neill was drowned. The *Enterprise* says he belonged to Eganville and was the sole support of his aged mother.

NEW YORK.

The following is the official list of the prices obtained at the New York Lumber Auction Company's sale at New York on July 13th :—

Lot 1—Sap pine moulding strips, 1 inch, 12,866 ft, $13.

Lot 2—Brown ash, 1½ inch, firsts, 1,701 ft ; seconds, 1,286 ft ; culls, 405 ft, $24.

Lot 3—Brown ash, 3 inch, firsts 3,553 ft ; seconds, 3,195 ft ; culls 960 ft, $22 50.

Lot 4—Brown ash, 3 inch, firsts, 1,745 ft ; seconds, 1,405 ft, culls, 551 ft, $20.

Lot 5 –Quartered sycamore, 1 inch, firsts, 5,021 ft ; seconds, 3,025 ft ; culls, 1,149 ft, $30.

Lot 6—White pine shelving, common rongh, 1 inch, ,769 ft, $15.

Lot 7 —Brown ash, 1 inch, firsts, 3,076 ft ; seconds, 2,054 ft ; culls, 1,588 ft, $20.

Lot 8—Brown ash, 1 inch, firsts, 2,128 ft ; seconds, 2,175 ft ; culls, 1,256 ft, $19 50.

Lot 9—Brown ash, 1 inch, culls, 5,872 ft, $11.

Lot 10—Brown ash strips, clear, 1 inch, 3,006 ft, $13 50.

Lot 11—Whitewood, ¾ inch, firsts, 3,240 ft ; seconds, 3,675 ft ; culls, 344 ft, $23 50.

Lot 12—Whitewood, 1 inch, firsts, 3,543 ft ; seconds, 4,136 ft ; culls, 508 ft, $24 50.

Lot 13—Brown ash, 1 inch, firsts, 2,671 ft ; seconds, 2,312 ft ; culls, 1,141 ft, $16 00.

Lot 14—Brown ash, 1 inch, firsts, 2,080 ft ; seconds, 1,571 ft ; culls, 1,060 ft, $16 50,

Lot 15—Brown ash, 1 inch, firsts, 1,954 ft ; seconds, 1,602 ft ; culls, 1,218 ft, $15.

Lot 16—Brown ash, 1 inch, firsts, 1,740 ft ; seconds, 1,698 ft ; culls, 1,057 ft, $15.

Lot 17—Brown ash, 1 inch, firsts, 3,922 ft ; seconds, 3,607 ft ; culls, 2,275 ft, $14 50.

Lot 18—Brown ash, 1 tnch, firsts, 6,582 ft ; seconds, 6,455 ft, $16.

Lot 19—Sap pine moulding strips, 1 inch, $17 50.

Lot 20—Whitewood, ⅝ inch, firsts, 8,691 ft ; seconds, 5,916 ft ; culls, 484 ft, $22.

Lot 22—White pine box 1½ inch, 10,037 ft, $14 75.

Lot 23—Cherry, 1 inch, seconds, 744 ft , culls, 1,834 ft, $21.

Lot 24—Whitewood, pl. 2 s., ⅝ inch, firsts, 2,360 ft ; seconds, 2,731 ft ; culls, 58 ft, $20 50.

Lot 25—Whitewood, 1½ and 2 inch, firsts, 3,996 ft ; seconds, 2,756 ft ; culls, 81 ft, $28.

Lot 26—Whitewood, 1 inch, firsts, 1,426 ft ; seconds, 3,790 ft ; culls, 3,143 ft, $19 50.

Lot 27—White pine shelving, com. rough, 1 inch, 6,352 ft, $16.

Lot 28—Whitewood, extra wide, ⅝ inch, firsts, 4,168 ft ; seconds, 1,275 ft ; culls, 91 ft. $28 50.

Lot 29—White pine selects, 1½ & 2 inch, culls, 937 ft ; picks, 1¼, 1½ & 2 in., 2,470 ft ; box, 1½ inch, 51 ft, $23.

Lot 30—W. pine selects, 1 inch, 494 ft ; picks, 1 inch, 9,126 ft, $21.

Lot 31—White pine, uppers, 2 inch, 4,671 ft ; picks, 2 inch, 176 ft. $43 50.

Lot 32—Walnut, 1 inch, firsts, 373 ft ; seconds, 967 t ; culls, 1,313 ft, $41.

Lot 33—Red oak, 2 inch, firsts, 463 ft ; seconds, 2,-367 ft ; culls, 5,305 ft, $10.

Lot 34—Sap pine, moulding strips, 1 inch, 2,451 ft, $15.

Lot 35—Sap pine, moulding strips, 1 inch, 4,643 ft, $15 50.

Lot 36—Sap pine, moulding strips, 1 inch, 5,359 ft, $15 50.

Lot 37—Cherry, 1 inch, seconds, 301 ft ; culls, 3,167 ft, $23.

Lot 38—White pine uppers, 1¼ inch, 4,580 ft, $41 50

Lot 39—White pine uppers, 1½ inch, 3,654 ft, $41 50

Lot 40—W. pine box, 1 inch, 14,706 ft, $14.

Lot 41—W. pine box, 1 inch, 20,025 ft, $14.

Lot 42—Whitewood, 1 inch, seconds, 2,976 ft ; culls, 9,896 ft, $19.

Lot 43—Whitewood, ⅝ inch, firsts, 9,316 ft ; seconds 5,048 ft ; culls, 179 ft, $21.

Lot 44—W pine picks and box, 1 inch, 4,274 ft, $15.

Lot 46—Sap pine, moulding strips, 1 inch, $16 50.

Lot 47—Brown ash, 1 inch, firsts, 914 ft, seconds, 2,484 ft ; culls, 2,479 ft, $10.

Lot 48—Whitewood, 1½, 2 and 2½ inch, firsts, 6,514 ft ; seconds, 3,829 ft ; culls, 93 ft, $28 50.

Lot 49—Pine common stocks, 1x12 inch, 10,715 ft, $13 75.

Lot 50—Whitewood, 1 inch, firsts, 9,141 ft ; seconds, 4,583 ft ; culls, 231 ft, $27 50.

Lot 51—Whitewood, 1 inch, firsts, 1,437 ft ; seconds, 1,502 ft ; culls, 314 ft, $25 50

Lot 52—Brown ash, 2½ inch, firsts, 3,654 ft ; seconds 4,186 ft ; culls, 1,012 ft, $21 50.

Lot 54—Whitewood, 1 inch, firsts, 1,269 ft ; seconds, 2,289 ft ; culls, 103 ft, $28.

Lot 55—Whitewood, 1 inch, firsts, 2,342 ft seconds, 3,531 ft ; culls, 259 ft, $24 50.

Lot 56—Brown ash, 3 inch, firsts, 3,583 ft ; seconds, 3,131 ft ; culls, 968 ft, $16.

Lot 57—Brown ash, 3 inch, firsts, 4,380 ft ; seconds, 3,337 ft ; culls, 1,576 ft, $15.

Lot 58—Cherry, 1 inch, seconds, 655 ft ; culls, 4,174 ft, $18.

Lot 59—W pine shelving, common, ⅞ inch, planed two sides, 16,297 ft, $12.

Lot 60—Sap pine moulding strips, 1 inch, 12,507 ft, $16.

Lot 60½—Brown ash, 4 inch, firsts,968 ft ; seconds, 1,217 ft ; culls, 167 ft, $20.

Lot 61—Brown ash, 2 inch, firsts, 1,405 ft ; seconds, 2,997 ft ; culls, 775 ft, $17 50.

Lot 62—Whitewood, 1 inch, firsts, 4,245 ft ; seconds, 5,900 ft ; seconds, 1,331 ft, $24.

Lot 63—Cherry, 1 inch, firsts, 489 ft ; seconds, 1,922 ft ; culls, 166 ft, $50.

Lot 65—Whitewood, 1 inch, culls, 2,191 ft, $15.

Lot 66—Walnut, 1 inch, culls, 2,894 ft, $36 50.

Lot 67—Walnut, 1 inch, firsts, 162 ft ; seconds, 5,192 ft, $60.

Lot 68—Pine roofing boards, 1x10 inch, t and g, pl 1 s, 4,226 ft, $18 50.

Lot 68½—Brown ash, 3 inch, firsts, 2,231 ft ; seconds 1,579 ft ; culls, 443 ft, $15 50.

Lot 70—Whitewood, 2 inch, firsts, 3,859 ft ; seconds, 2,336 ft ; culls, 186 ft, $28 50.

Lot 71—Whitewood, ⅝ inch, firsts, 8,877 ft ; seconds, 4,634 ft ; culls, 111 ft, $21 50.

Lot 72—Whitewood, 1 inch, culls, 3,574 ft, $15 75.

Lot 73—Basswood, 1 inch, culls, 4,046 ft, $17 50.

Lot 74—Basswood, 1 inch, firsts, 2,963 ft ; seconds, 3,710 ft, $22.

Lot 74 a—Whitewood, 1 inch, culls, 11,344 ft, $15 50.

Lot 74 b—Walnut, 2 inch, culls, 6,318 ft, $29 50.

Lot 75— Whitewood, extra wide, ⅞ inch, firsts, 10,-434 ft ; seconds, 5,188 ft ; culls, 1,096 ft, $23.

Lot 76—Walnut, 1 and 3 inch, seconds, 1,231 ft, $51.

Lot 77—Walnut, 1, 2 and 3 inch, culls, 6,887 ft, $36 50.

Lot 78—Whitewood, 2 inch, firsts, 3,909 ft ; seconds, 1,762 ft ; culls, 34 ft, $30.

Lot 79—Whitewood, 1 inch, culls, 3,485 ft, $15 50.

Lot 80—Whitewood, 1 inch, culls, 3 297 ft, $14 50.

Lot 82—W pine brx, 1 inch, 12,589 ft, $14.

Lot 83—Brown ash, 3 inch, firsts, 3,635 ft ; seconds, 3,710 ft ; culls, 509 ft, $14

Lot 84—Brown ash, 3 inch, firsts, 2,391 ft ; seconds, 2,877 ft ; culls, 534 ft, $11.

Lot 85—W pine box, 1 inch, 21,291 ft, $13.

Lot 86—Whitewood, 2 inch, firsts, 460 ft ; seconds, 569 ft, $28.

Lot 87—Whitewood, s 2 s, 1 inch, firsts, 3,305 ft seconds, 5,908 ft ; culls, 112 ft, $24 50.

Lot 88—W pine, selects and picks, 1 inch, 7,009 ft, $24.

An exchange says :—Years ago two fences on a western farm were built of basswood rails. In one, the rails had been cut in summer ; in the other the rails had been cut in winter. The winter-cut rails rotted, but the summer cut became hard like iron and lasted for a very long time. It is explained that in the rails cut in winter the sap was a long time in drying, and that in consequence it fermented and spoiled the wood ; while the rails cut in summer seasoned rapidly in the hot weather and hardened.

West's World's Wonder or Family Liniment is a remedy that no well regulated household should be without, as it is a positive cure for Rheumatism. It is invaluable for Sprains. Cuts, Bruises, Burns, Scalds an all diseases requiring external application. rice 25 cents and 50 cents per bottle. Sold by—

If any of our readers that are afflicted with rheumatism have never tried West's World's Wonder or Family Liniment, we advise them to do so at once, and be convinced of its extraordinary merits. It is a never-failing remedy for cuts, sprains, bruises and all complaints requiring external treatment. Price 25 cents and 50 cents per bottle. Sold by J. D. Tully.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination ; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still, No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

Market Reports.

TORONTO.

From Our Own Correspondent.

JULY 24.—Our retail yards continue to do a rattling trade, although not near the amount they would do if the wholesale men would stop doing a retail trade. Want of cohesion in the trade is the sole fault and until such times as this fact is felt, and acted upon, things will go on the same as now. Let the the retail men once determine that they intend to do the retail trade, or cease to buy from the middlemen, and the whole matter is settled.

Shipping from our docks, as predicted by me in a former letter, has fallen off to a mere nothing. The Longford stock being shipped by Christie, Kerr & Co, to a Boston firm is about all that is being moved at present. The Ontario Co.'s stock bought by the same parties, is all shipped out, and the stock at present being moved is scarcely fit to handle; in fact there is no dry stuff, except the little held in stock by the retail men and some piled off by track side, and this is rapidly diminishing.

Bill stuff cut to fill orders is ruling high. Just now quite a number of the mills have not got in their tows of long logs as yet, so that comparatively few mills are able to fill bills over twenty 20 feet in length and the few that can do so demand a good figure. As the season advances present prices for long bill stuff will be pulled down being now far above their real value, One mill man demanded $50 per M on cars for 45 feet lengths. The same stuff can be bought in Liverpool, England, to-day for less money. This is the great fault of many of our mill men, when they get the chance they spread it on too thick. From the other side of Georgian Bay there is considerable lumber coming to market, but the mill men at those points take care to make all there is to be made by quoting prices delivered in Toronto, and so the advantage of the low railroad freight, which is only five cents per hundred weight. Of course few men will be ready to blame them for taking advantage of this, but coupling it with the present prices demanded for bill lumber, it makes it high to the consumer here.

Dealers in all cases possibly prefer to bring in lumber by the G. T. R. or C. P. R., thereby escaping the petty difficulties thrown in the road of the consignees by the N. & N. W. R R. Co. Dealers were promised before the managers departure for England that such annoyances would be remedied, but so far such has not been the case, and the amount of red tapism at present existing is trying to the patience of the average lumberman.

MONTREAL.

From Our Own Correspondent.

JULY 26.—There is no essential change to note in quotations during the past week. Business still continues brisk, although the demand for large quantities has slightly fallen off, as a number of contractors have now a fair amount of stock on hand for future need. Enquiry for carloads has improved considerably since last report. It is said that mill owners have taken many orders for future delivery, and that present stocks in first hands are light. In this market there is a good supply of thin lumber, but the quantity of heavy available is light. The exports to date include 986,488 pcs. of deals, deal ends and boards, to Europe, and 2,876,781 feet to South America.

Advices from the Saguenay state that the cut of logs in that district last year was very large, upwards of 600,000 logs having been cut, and in most of the establishments on the North Shore operations were conducted entirely on Messrs. Price Bros.' account This firm has bought the deals produced by the logs cut by the English company of the Seigniory of Mille Vaches, the site of whose operations is Port Neuf en bas. Numbers of vessels are loading in the Saguenay, also for the account of Messrs. Price Bros.

CHICAGO.

The *Northwestern Lumberman* of July 24th says :—

BY THE CARGO.

Cargoes to the number of 175 have entered port during the week. The Monday fleet was a fair one, but since then the market has not been liberally supplied with offerings A large amount of lumber is being sold at the mills, or by the commission men to arrive, and does not come on the market. The demand is just moderate enough to check lavish receipts, and keep prices steady. The demand is the most urgent for piece stuff, and that is the kind of lumber that is doled out with the greater caution. There is some buying over the lake, however, and considerable dimension is going into yard that does not figure on the market.

The price of piece stuff remains at former quotations, though it is reported a little stronger than last week. Short green piece stuff, as a basis, is now quoted at $9, and firm at that. The lowest positive price for dimension we have heard of this year was $8.75 for a lot of flat 16-foot Norway, in a transaction that took place a week or 10 days ago. That seems to have been the bottom, and it is likely that prices will not go as low again this year. The tendency now is to greater strength and a slight advance. There are men about the market that even now assert that piece stuff is worth $9 25 for all white pine. One dealer has lately sold 10 cargoes of White lake piece stuff, all short, at $9 a thousand, the lumber to come forward within a few days. This lumber was shaped up a little for the convenience of the purchaser, who wanted the 2x6, 2x8 and 2x10, probably for car decking; but this shaping up is a thing that is easily done when the order goes to the mill, and is becoming a feature of late dealings. Much of the large purchasing at the mills, peculiarly characteristic of the past two seasons, has been on this basis, because the yard man can thus get what is adapted to his trade, and not run so much risk of getting an over-stock of unsaleable lumber. In these times of next to no margins, the wholesale dealer must get an advantage some way and so he goes to the woods, or the boom, or the mill to hunt for it. If he be a good judge of logs and lumber he can generally do better for himself than he can to buy on the cargo market.

The demand for long and heavy joists is good. Cargoes of 2x12 sell from $11.50 to $12.50 a thousand. Extra lots of 3x12 bring as much as $13. Timbers sell fairly well. The call for bridge stuff to go into railroad construction is reported quite urgent by the men who make that feature of business a specialty.

Inch lumber is working off moderately under a demand that cannot be called active. Prices are made within our quoted range. Buyers are not looking to the cargo market for good inch lumber as they once did. The larger portion of such lumber to stock yards is bought in a special way at the mills or to arrive.

This season the yard men are not so anxious to lay in large stocks of high grade lumber as they wore last year. The sale of such lumber this season out of yards has been slow. Naturally this checks the demand.

Standard shingles are a little firmer this week than hitherto. The mills over the lake are running with some reference to the demand; that is they are not crowding production to the utmost, as they generally do. Offers have have this week been refused on the part of the seller at $1 70 for certain brands that have been freely selling at that figure, and $1 72½ demanded It is likely that next week quotations will have to be advanced.

AT THE YARDS.

There has been a slight increase of movement within the past few days. Whether this is wholly owing to closing out of shipments on the low rate at Omaha, before the incoming of the new rate of 14 cents a hundred, is a question that the dealers are discussing. No doubt the haste to get as much lumber as possible into Nebraska on the 8 cent cut rate has lately stimulated shipments in that direction, for it has been plain to see that heavy trains have been loaded, with Nebraska points for a destination. This little spurt, however, is now over, unless contracts have been made between the freight agents and some of the heavier of the shippers to overlap the new arrangement by a continuance of a cut rate, on the quiet. Such contracts are denied on all hands, and it is claimed that the 14-cent rate is strictly adhered to.

Receipts of lumber and shingles for the week ending July 22, as reported by the Lumberman's Exchange :—

	RECEIPTS. Lumber.	Shingles.

LONDON.

The *Timber Trades Journal* of July 17th says :—It is too early to hazard any predictions as to the course that trade will take during the remainder of the current year, more especially as the country has scarcely recovered from the disorganization occasioned to business by the recent elections. The feeling in many quarters is hopeful, and confident predictions of a good autumn trade are expressed by many to whom, probably, the wish is father to thought. At the same time it must be admitted that the import so far contrasts favorably with other years, and the arrivals at the Surrey Commercial Docks continue on a moderate scale. As a set-off, however we have the fact that the deliveries from the same docks are, in the aggregate, less than in preceding years, while the majority of buyers continue to maintain that the present stocks in London are sufficient to supply the requirements of the trade for some time to come. Certain it is that little disposition is shown by importers here to add to their stocks, and the business that is being transacted is extremely limited.

We are always being told that things cannot go on for ever in the present ruinous state and a turn must be close at hand; yet still the market keeps on declining, and trade lanquishes as if hopelessly incurable. Even with reference to freights, when we asked the opinion of a leading merchant, who charters a large amount of tonnage throughout the year, as to whether

he thought the present combination of shipowners would effect the rates, his reply was that he had recently chartered from one of the gulf ports to London at a lower rate than had ever previously been done. Notwithstanding this we think we can observe a lifting of the clouds which have so long lowered over the freight market, and the gleam of light on the horizon is the present tendency of owners to lay their vessels up. Still there are too many steamers even now afloat, but the example already set, we are glad to observe, is taking root. In the north, steamers are to be seen lying up in dozens and the Humber is said to be chokefull of vessels out of employment.

Messrs. Churchill & Sim, if they had very little to submit on Wednesday last, at any rate succeeded in bring a fair muster of the trade together. Of course a good many of the regular frequenters were absent, this being the season of the year when the seaside exercises its attractions; but, taking one thing with another, the attendance was rather better than the limited quantity of unreserved goods would have led one to expect.

The first open water pine fleet are coming forward now pretty freely, and we have no less than ten arrivals from Quebec to record this week.

We were rather surprised to see these better kinds going so cheap as they were put up in such small lots; and, judging by the present tone of the market, any improvement this year seems out of the question, for there is the contemplation of the heavy stocks eating their heads off with expenses, which may at any moment come on the market to check any bouyancy that might otherwise exert itself.

The little lots of 3rd bright Quebec pine deals per Clara at £8 15s. read cheap, but there was no particular anxiety to secure them amongst those present, the lengths, 9 and 10 ft., not being those most inquired for. Adding on rent and charges gives another complexion to values, and it makes all the difference how long they have been on hand to the seller at the present wretched auction prices.

Amongst this week's pine arrivals from Quebec are the Sabino, Carmona, Kalos, our old friend the Drammenseren, the Lake Leman, Rhine and Alfield, the latter for Messrs. R. R. Dobell & Co Of these the Sabino brings a cargo of 1st, 3rd and 4th pine for Messrs. Browning & Co., of which the prime quality is being landed and the third we noticed going into lighters; these struck us as being a capital lot of Maclaren's shipment, and in good. dry condition. The Carmona brought for the same firm principally Hamilton's 4th pine, which are being stacked in D yard, and are about as good a parcel of lower quality pine as we have seen. We could point to one or two stacks in their neighborhood of 3rds of another shipment with which they would favorably compare. The Kalos and the Lake Leman have gone into the Surrey Commercial docks, as have also the Alku, and the Hermann, for Messrs. Arnold & Co., as well as the Edmund Kaye, with deals and deal ends, for Messrs. Price & Pierce. The bulk of these have a considerable portion of their cargoes oak, elm, and birch, but the Rhine, from Montreal, brings an entire cargo of deals and deal ends to order.

LEITH.

The *Timber Trades Journal* of July 17th says:—The importations of wood goods during the past week continue light for the season of the year, and the only item calling for particular notice is a further arrival from Quebec of a general cargo of pine, hardwoods, and pine deals per Clyde, for Messrs. Wm. Thomson & Co. There are still other three or four cargoes expected from Quebec, of the spring shipment, so that the supplies from that quarter promise to be heavier than usual.

CARDIFF.

The *Timber Trades Journal* of July 17th says:—During the past week we have had only one cargo of mining timber from Norway, one of pitch pine timber from Pensacola, and a good-sized cargo of deals from St John. One market cargo, which came forward at the same time, has been ordered to Sharpness. As far as we can learn, several charters have been signed, both from Canada and from the Baltic, 40s. from lower Canadian ports, and 50s. Quebec

The week just elapsed, in consequence of the elections, has, of course, been rather upset, but as these are now over, we expect to see deliveries a good deal brisker than they have been. The building trade continues active, and our town and suburbs, especially the latter, are growing rapidly; but, as we have before stated, these operations in themselves are not sufficient to keep the wood trade up to the mark. Mining timber remains in the same stagnant state as all through the year; very little is coming forward, and yet prices remain low. The French prop trade is in much the same condition as recorded last week, a state of things principally attributable, we think, to the import exceeding the consumption.

GLASGOW.

The *Timber Trades Journal* of July 17th says:—Arrivals here for the past week include a cargo or two of lower port spruce deals, the supply of which this year has been very light; and as would be observed from statement given in last number, the stock held at 30th of June was comparatively small. The tonnage employed in conveyance of spruce deals (lower port) to Clyde amounts this year up to date to only 3,580 tons, as against 4 934 tons same period last year. Of the cargoes of spruce noted under the Glasgow imports this past week the bulk goes into the hands of consumers direct.

There has been one small import of Quebec deals per steamer, and the total landed at Glasgow since the season commenced is now 78,000 pieces, as against 108,000 pieces same period last year. Other arrivals here for the week have been miscellaneous parcels of oak logs and planks, staves, etc.

The Grangemouth imports, we observe, continue light, the carrying tonnage conveying wood goods there during the past three weeks being 6,672 tons, and for corresponding period 1885 16,752 tons, and 1884 11,338 tons.

The demand generally in the wood trade being very dull at present makes it advisable that imports should be on a small scale.

LIVERPOOL.

The *Timber Trades Journal* of July 17th says:—The first vessels of the Quebec spring fleet have just arrived here, and consequently the quays of the Canada and Brocklebank docks, which are allotted to the timber trade will soon wear a lively aspect, in great contrast to the apathetic appearance they have bone for such a lengthened period.

The first of these is the Loyal with a cargo of timber, chiefly waney and square board pine, the importation of Messrs. Bryant, Powis & Bryant, limited, which is now discharging in the Canada dock, and two vessels are lying in the river with cargoes of pine deals from Quebec and Three Rivers, waiting opportunity to enter the docks, the heavy western gales blowing at present rendering it a difficult and dangerous operation. In addition to these there are also six or eight vessels with spruce deals, chiefly from the lower ports, in a like position, and two with cargoes of pitch pine; so that next week will be a busy one.

Most of the spruce deal cargoes are already sold, and considerable portion of their cargoes will go direct into consumption being forwarded from the ship's side up to the country districts.

No public sales of whitewoods are announced at present, but probably some will be held within a short time from now, although they will not be either so numerous or extensive as usual, owing to the limited quantities of consignments direct from the shippers, who are not at all disposed to send their productions on the market in the face of the present low prices ruling in this port.

Ocean Freights.

The Quebec *Chronicle* of July 22nd says:—Two hundred and sixty-eight sea-going vessels have entered at the custom house since the opening of navigation. The following are the transactions we have heard of:—Quebec to Cardiff—Sleepers, 50s. Quebec to Greenock—Timber, 18s. 3d.

LIVERPOOL STOCKS

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool, Birkenhead and Garston, on June 30th 1885 and 1886, and also the consumption for the month of June 1885 and 1886

	Stock, 1885	Stock, 1886.	Consumption 1885.	Consumption. 1886

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. patent office, July 13, 1886, is specially reported by Franklin H. Hough, solicitor of American and foreign patents, 925 F street, N. W. Washington, D. C., who will furnish copies of patents for 25 cents each.

345 466—Lathe, wood turning—C. W. Wilder Fitchburg, Mass.

345,503— Planing machine, wood—E. H. Hanson, Philadelphia, Pa.

345,388— Saw gummer—S. R. Mathewson, Pleasant Valley, Cal.

345,648—Saw handle—R. E Poindexter, Indianapolis, Ind.

PATENTS ISSUED JULY 20.

345,662—Cutter head—E. G. Blaney, Swampscott, Mass.

345,890—Plane, blind nailing—W. G. Stranahan, Minneapolis, Minn.

345,791—Saw set, gage and raker guide, combined—M. Lalonde, Oscoda, Mich

345,753—Saws, automatic feed for edging—E H. Barnes, Brooklyn, N. Y.

345,928—Wood, preparation of kindling—J. L. Seymour, New York, N. Y.

RAFTS ARRIVED

The Quebec *Chronicle* gives the following list of rafts arrived:—

July 8—D. D Calvin & Co., oak, elm and pine, Michigan and Ohio, sundry coves.

July 9—Thos. Buck, elm, Michigan, Ottawa cove.

July 10—P McLaren, white and red pine, Ontario. St. Lawrence Co.'s cove.

July 16—David Moore, white and red pine, Nipissing, Cap Rouge.

July 20—Timmons & Gorman, white and red pine Nipissing, Cap Rouge.

Quebec, 16th July, 1886.

THE TIMBER TRADE.

A despatch from Quebec to the Montreal *Witness* says:—*Le Canadien* publishes to-day the report of an interview between one of its reporters and a number of shippers and others prominently connected with the timber trade of the port, touch a despatch published in the *Witness* stating that a steamship had been obliged to go to Montreal to take in a cargo of deals there owing to the onerous regulations of the Ship Laborers' Society here. All agreed that the despatch was well founded, and that the absurd regulations of the ship laborers were driving both steam and sail vessels from Quebec, numerous instances being specified in which they have operated injurious to the trade of the port and beneficially to that of Montreal. At the same time it was admitted that the wages demanded by the ship laborers were not too high, considering the dangerous character of the work. The Canadian Pacific freight agent here, Mr. Lemieux, stated that it was true that Quebec merchants were daily receiving and paying freight at the rate of 12 cents per hundred on large quantities of goods which were carried to Montreal by inward steamships past Quebec rather than have to submit to the ships laborers' exactions here, and Mr. R. R. Dobell said that for the same reason numbers of Quebec merchants preferred to ship their deals via New York or Boston.

GILMORE & Co's drive of forty thousand sawlogs passed through the slide at Hastings on Monday.

HUGH GIBSON,
MANUFACTURER OF
KNIGHT'S PATENT "EXCELLSIOR"
SAW MILL DOGS

The Sawyer's Favorite

For Holding Logs upon a Saw Mill Carriage while being Sawn into Lumber.

These Milldogs I guarantee to give satisfaction in every case. They will hold a frozen log as well as a soft one, for cutting Scantling, Square Timber, &c. These Dogs cannot be excelled, I sell them all on their own merits, give ten or fifteen days trial, and then, if not satisfactory, return them to my order, as I have no agents on the road this year, I will sell them at a reduced price. Send for Circular and price list.

EXCELSIOR DOG.

Manufactured by HUGH GIBSON, CHATHAM.

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

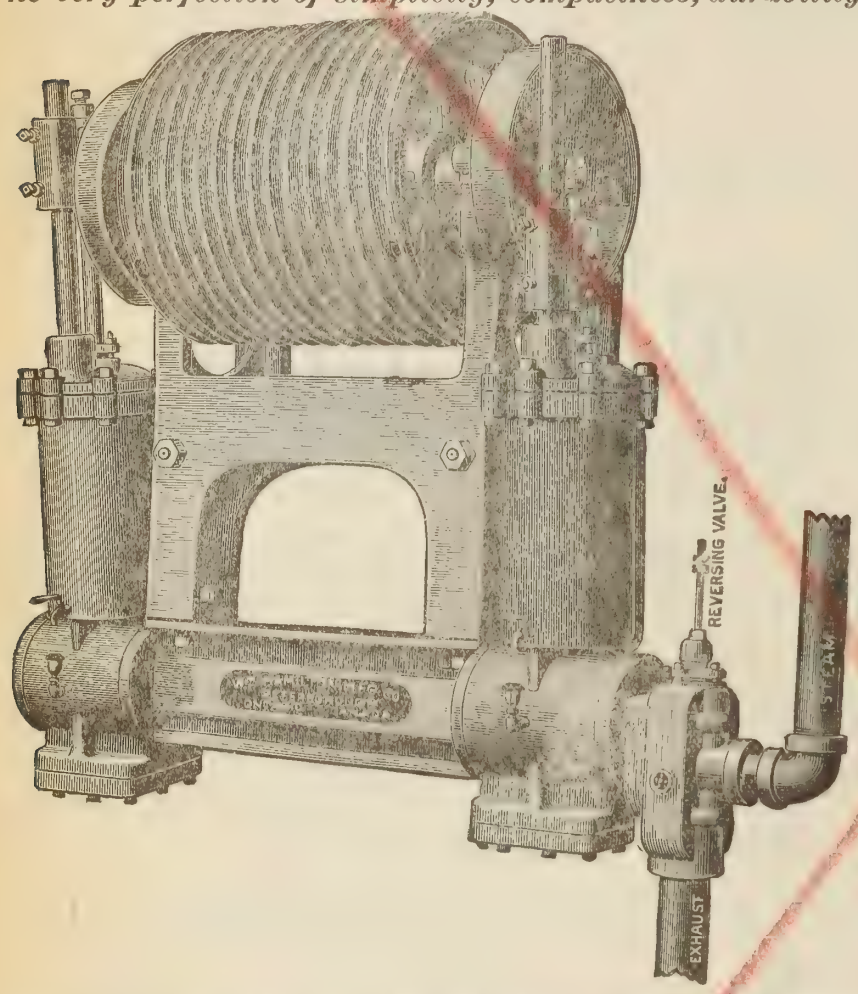
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATNG TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROP.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoud ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfai & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞*We guarantee this to be the best Mill of his kind got up, and would ask any one wanting a good Band Saw Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacurers,*

ALASKA'S TIMBER RESOURCES.

A correspondent writes to the *Western World*:—"Alaska is square-shaped, with two horns projecting from the southeast and southwest corners, the former called southeastern Alaska, the latter being the Aleutin islands. This southeastern horn is the place where is congregated nearly all the white population engaged in those indutries over which the government has thrown no special protection.

"Nearly all of Alaska south of the Arctic cicle may be covered with timber, except an immaterial portion facing Behring sea and the Aleutian islands, although, in the broadest sense, none of it is fit for more than local use, except southeastern Alaska, and most of this, rom its remoteness, can never expect to compete with the more valuable and vast timber fields of British Columbia, Oregon and Washington territory until the latter are exhausted. There is one exception to this general rule, however, in a very valuable kind of timber found near the tip of the southeastern horn, along the Pacific coast. I refer to the yellow cedar of Alaskan parlance. For a number of years it has been used upon the northwest coast as a fancy wood, from its exceeding fine texture, great durability, and odor which, though agreeable to the genus homo, is a sure preventive to moths, and other good qualities for cabinet making, special woodwork and so on.

"The yellow cedar attains enormous size compared with the dwarfed species by which it is surrounded, often reaching a height of over 100 feet and corresponding diameter at the butt, shown by the conifer family. When I was in Boca de Quadra inlet, Alaska, not from Dixon entrance, that separates this territory from British Columbia, we had to unload 65 tons of freight a salmon cannery there, and this was done in two loads by a raft made of two logs of yellow cedar not yet thoroughly seasoned. I thought they were ten feet at the butt, so grand were the logs, but probably two-thirds that would be about the truth. Even in the region that this extremely valuable tree occupies—the third of southeastern Alaska—it is not found in large districts, either in compact forests or straggling cases among other kinds, but rather in little isolated groups, or patches here and there, 10-acre and 100 acre lots, so to speak; but, once found, this patch is quite densely populated with them. This would really be greatly in its favor in securing these 'groups as timber land. Some of them, however, are quite large, and many have never been well outlined, and others, no doubt, are yet to discovered in this almost wild country. Most of it grows near the water, and this phase, in an Alpine country, cut up by numberless channels and inlets of water running in every direction and creating thousands of islands, may be readily appreciated. Near by the old Russian towns the clumps have been exterminated by them before we came in possession of Russian America, and had they held it I have but little doubt it would now be worked on a large scale, or monopolized by some Moscovite favorites. While living in Oregon and the adjacent territories I often heard these valuable fields of timber discussed by parties who desired some law to protect them in securing them, and I was more than impressed with their sayings when I afterwards visited the districts. I look on the industry based on this timber as one of the future 'bonanzas' of Alaska, and the only one in the line of timber."

TREES ON THE PACIFIC SLOPE.

George H. Hamm, the well-known correspondent, who is "doing" British Columbia in the interests of the Winnipeg *Manitoban* writes as follows:—"The timber supply of the province is apparently inexhaustible, and will doubtless prove a mine of wealth before many years. Already shipments are made to the Australian, South American and Chinese markets, but the volume of trade has not as yet reached the proportion that it is capable of. The principal tree is the Douglas fir, which ranges from four to twelve feet in diameter, and from two hundred to three hundred feet high. It is straight and tough, and capable of bearing a great strain, and is almost unequalled for bridging, framework and for shipbuilding, while its great length and straightness make it especially adapted for masts and spars. Besides the Douglas, the following trees are to be found in the province—the lists being obtained from a work issued by the local government: Western hemlock, large, found on coast and Columbia river; Englemann's spruce, eastern part of province and interior plateau; Menzie's spruce, very large, mostly on coast; great silver fir, coast tree of great size; balsam spruce, abounds in Gold and Selkirk ranges, and east of McLeod's Lake; Williamson's Alpine hemlock, too scarce and too high up to be of much use; red pine (yellow pine or pitch pine), a variety of the heavy yellow pine of California and Oregon, very handsome, four feet diameter, common in drier parts of interior; white pine (mountain pine), Columbia region— Shuswap and Adarms' Lakes—also interior of Vancouver's island; white-barked pine, small; western cedar (giant cedar or red cedar), wood pale, yellow or reddish color, very durable, often found 100 to 150 feet high, and 15 feet thick; yellow cypress (yellow cedar), mainland coast, Vancouver and Queen Charlotte islands; western larch, (tamarac), Rocky Mountains, Selkirk and Gold ranges, west to Shuswap Lake, large tree, yield a strong, coarse, durable wood; maple valuable hardwood on Vancouver and adjacent islands, Queen Charlotte island and the mainland coast, up to 55°, attains a diameter of four feet; vine maple, very strong, tough whitewood, confined to coast; yew, Vancouver and opposite mainland shores, very tough and hard, and of a beautiful rose color; crab apple, along all the coasts, wood very hard, takes good polish, and withstands great wear; alder, two feet thick, on the Lower Frasar and along coast, good furniture wood; western birch (paper or canoe birch), Columbia region, Upper Fraser, Peace River, range and value not much known; oak, on Vancouver Island 70 feet in height, and three feet in diameter; dogwood, Vancouver and coast opposite. Arbutus, close-grained, heavy, resembling box; reaches 50 feet in height, and 20 inches in diameter, found on Vancover and neighboring islands. Aspen poplar, abounds over the whole interior, reaching a thickness of two feet. Three other varieties of poplar are found, commonly included under the name cottonwood. One does not extend above Yale, and is the same wood largely used in Puget Sound to make staves for sugar barrels for San Francisco. The other two kinds occur in valleys in the interior. Mountain ash, in the interior; Juniper (red cedar or pencil cedar) east coast of Vancouver, and along the shores of Kamloops and other lakes in the interior.

There are already some very extensive saw mills in operation—and have been cutting for a quarter of a century—and yet this branch of industry is only in its infancy. Not only is there the trans-Pacific trade, gigantic as it should soon be, but with cheap freight rates the treeless plains of the Northwest could be readily supplied and profitable interchange of commodities spring up.

A THRILLING EXPERIENCE.

DETROIT, Mich., July 31.—A Chicago special says: The Canadian steamer Isaac May staggered into harbor at a late hour on Thursday night without fuel and almost destitute of provisions. Captain Muir, her master, relates a thrilling experience. The May left Chicago three weeks ago, towing three barges. After a run of five days they arrived at the Manitoulin island, on the Canadian side of Lake Huron, the largest island in the great lakes, covered with cedar trees. When the vessel arrived the inhabitants were badly frightened. For weeks not a drop of rain had fallen. The steamer and her tow began to take on cargoes of posts and ties, when the woods suddenly burst into a great blaze. No sooner had the fire started than a severe wind storm swept over the island driving the flames in every direction. The people fled in terror to the beech and sought shelter on board the vessels, which pulled out into the lake. Scores of bears, roaring with pain, ran out of the woods, with the hair singed from their hides, and plunged into the lake. The flames raged for five days, burning over acres of valuable timber and destroying a vast amount of stock piled on the beech for shipment. Then a drenching rain storm set in, and continued until the fire was put out. It was ten days from the time the vessels reached there before they were ready to leave, and their stock of provisions was almost exhausted in caring for the people who took refuge there. Still Capt. Muir thought he could make his provisions hold out until they reached Chicago, but he did not count on having head winds all the way.

The vessels left the island last Saturday morning, and as dense clouds of smoke from the burning timber had settled down over the water, the vessels had to pick their way slowly through the darkness. The steamers passed the Straits on Monday, but hardly had entered Lake Michigan when they ran into another band of smoke that shut out everything from view. So thick was the atmosphere that the first barge of the tow could not be seen from the decks of the steamer. On all sides could be heard the fog signals of passing steamers. By moving slowly and sounding whistles at frequent intervals, the steamer made her way through the smoke in safety. Her progress had been so greatly impeded, however, that when one hundred miles north of Chicago the engineer reported the coal bunkers empty, and the steward informed the captain that nothing was left to eat but salt pork. The crew were put under short rations and the deck load posts were drawn on to feed the furnaces, but the cedar was so green that the boilers could hardly be kept warm. Finally the steamer cut her consorts adrift and came to Chicago under sail without them. The experience of the steamer at the Manitoulin island during the fire was thrilling. The scene from the vessels as told by a spectator was grand beyond description. The flames shot into the air for hundreds of feet and turned night into day, while the heat was so intense that the vessels were obliged to push out into the lake. The noise was deafening, and amid all the din and confusion thousands of birds fluttered around their late homes, until, tired with constant flight, they dropped into the lake or fell into the flames. Deer and bears rushed from the woods together, and threw themselves into the cooling waters of the lake. For five days the flames held their sway before the lumbermen could return to island to finish loading the vessels. The barges were found off Racine and towed into port yesterday.

Timber Movement.

Mr. J. M. Irwin has sent forward from Lakefield to Quebec by all rail communication eight hundred and fifty pieces of square timber during the past week. This is the first time the all rail route from here has been utilized by lumbermen for the transhipment of square timber. This mode of transport has the advantages of being quicker, less risky, and the insurance on the stock is less. Mr. Irwin will send more square timber by the same route.

Chips.

A SIDE line has been built from the Messrs. Rathbun's mill at Campbellford to the Grand Junction track. Five sub lines have been laid down in the yards.

NEW piers, says the Campbellford *News* are about to be constructed by Messrs. Rathbun which will greatly improve the appearance of their premises and give stability to the made portion of their yard.

MR. JOHN WOODS' saw mill situated about 15 miles above Maniwaki, Quebec, on the river Desert, was on Aug. 3rd destroyed by fire; the loss is estimated at $1 500, no insurance. It is supposed to be the work of an incendiary.

AN employe of the Delta Lumber Company, at Thompson, upper Michigan, lost an arm in one of the company's mills. He sued for $12,000 damages, and was awarded $5,000. The case has been appealed.

ISRAEL MERRITT, a lumberman, of Bristol, N. B, has assigned. His liabilities are placed at $30,000. He gives preferences to the extent of $12 000. Among his creditors are several St. John firms. To one firm there he owes $4,000, to another $2 000.

STETSON & PAST, at Seattle, W. T., lately hired a few Chinamen to pack shingles. In the afternoon of the day when the Chinamen were first employed the mill hands struck and demanded the discharge of the Mongolians. The firm yielded, and the serenity of a Puget sound climate again brooded over the mill.

OWING to the low price of deals, as well as the limited demand for them, says the St John *Globs*, some of the mills are closing down and others are likely soon to do likewise. Messrs. Randolph & Baker's mill suspended operations last week; Messrs. S. T. King's, at Mosquito Cove, stopped work on Saturday last.

PARDEE, COOK & Co 's mill, at Gun Lake, Mich, together with the firms store, tramway, 350,000 feet of lumber, and seven cars belonging to the Flint & Pere Marquette railroad, were burned Aug. 3rd. The mill was valued at $40,000, and the total loss was placed at $80,000, against which there was but $20,000 insurance.

WHAT has come to be recognized as the best or standard speed for the main shaft of sawmills, says the *Timber Trades Journal*, is 250 revolutions per minute, and if a second or third shaft be used to give motion to lighter machines, this speed may be increased with advantage to 300 revolutions per minute, but not above as a general rule.

TRENTON, Ont., Aug. 10.—About 12-30 to-day a fire broke out in the fanning mill factory owned by Wm Fitzpatrick. The flames spread very quickly, and soon an adjoining planing factory, owned by Seeds Bros, was also in flames, and both were completely destroyed in a very short time. Cause of fire unknown. No Insurance. Loss about $5000.

French props, instead of advancing as customary at this season, remain at the low figure of something like 15s 6d. per ton, ex ship. This, we understand, is mostly owing to a rather large contract having been taken at even lower figures. Evidently there are some people with sufficient courage to speculate on even lower prices and lower rates of freight than are ruling now.

HOODLESS & SON, through their magnificent display at the Colonial Exhibition, received yesterday a tidy order for bedroom sets in elm, and walnut rockers The orders came from Gitten & Co., furniture dealers, Camden town, London, who state that their articles have been much admired and that quite a demand may be expected for them. This is news which ought to swell the heart of every Hamiltonian with pride. The order will be shipped at once.—*Hamilton Spectator.*

THE *Lumberman's Gazette*, of Bay City, Mich., says:—"The Emery Lumber Company brought over another load of logs from their Georgian Bay possession last Saturday, the the Wahnapetae barge being loaded with 600, 000 feet of pine logs. Having made all their arrangements to cut the products of their Canadian timber limits on the Saginaw river, they are not to be deterred by the additional export tax."

THE Deseronto *Tribune* says:—On Tuesday morning the tug Rescue brought in a tow of timber from Mill Island near Trenton. They were taken from the old Star mill which was erected many years ago by Messrs. Morton & Baker of Kingston, and afterwards owned by A. S, Page, Esq, of Oswego. The mill has not been run since it came into the hands of the Rathbun Company and now the timbers have been taken out to be used for other purposes. They are large and sound. The island so long known as Baker's or Mill Island is beautifully located and can be utilized for many purposes.

MR. E. WALTER RATHBUN, says the Deseronto *Tribune*, writing from Mr. M. Butler's camp in Algoma, states that they are making fair progress with their survey of the new townships. The country is rather rough in parts, and many sections having been burnt over in former years are now grown up with young poplar, hazel, &c. The weather has been variable, very hot during the day and very cold at night. Water on several nights was frozen in the pail. The expidition is not unaccompanied with hardships. Transportations are difficult. packing being the favorite method, the load being supported by a brand across the forehead. The loads vary from sixty to ninety pounds, though Indians and other natives sometimes carry from one hundred to one hundred and eight pounds weight. The hungry mosquito, ferocious black fly, and maddening sand fly, all abound and make life miserable. The party expect to be through with the survey by the first of September.

BLACK BIRCH.

A writer in the Hamilton *Spectator*, who have been visiting the Muskoka Lakes, says:—Lumbering is at present the most important industry in the whole of the Muskoka country, but the lumbermen interest themselves only in the pine. The woods are, however, filled with timber destined to be of very great economic importance to Canada The black walnut of Ontario is nearly exhausted. When it is gone back birch must take its place. This wood has already attracked the notice of cabinet makers and builders; and it value for furniture and house furnishing in very great, while its beauty is remarkable. Several members of the party secured specimens; and Mr. Hoodless, of Hamilton, who takes great interest in the matter, is making arrangements to show the capabilities of this wood in fine furniture. A fine field is before it.

RAFTS ARRIVED.

We take the following list of rafts arrived from the Quebec *Chronicle*:—

July 28—McArthur Bros. Co., (Limited) staves, U. S., New London cove.

July 29—J. B. Weller, waney white pine, Michigan, Dobell's, Sillery.

July 30—Collins' Bay R & T. Co., waney white pine, Western Canada, New London cove.

Aug. 2—D D Calvin & Co., spars and masts, Dobell's cove

Aug 4—Barnett & Mackie, white and red pine, Cap Rouge.

J. B Weller, waney white pine, Dobell's, Sillery cove

Take a Pill

To regulate the bowels and drive away the sick or bilious headache which is the result of constipation. But don't rack your frame and overburden your organs by taking the old-fashioned great, drastic, griping pills. Science makes rapid advances, and Dr. Pierce's "Pleasant Purgative Pellets" are the result of careful study and skilful preparation. They are entirely vegetable, and operate without disturbance to the organs of the body, or to the occupation or diet of the patient.

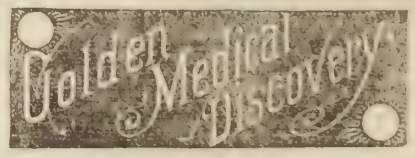
West's Nerve and Brain Treatment guaranteed specific for Hysteria, Dizziness Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity, and leading to misery, decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each bottle received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY, Druggist, Sole Agent for Peterborough.

Liebig's Condensed Mineral Waters **CARLSBAD** CURES Biliousness Liver Complaint, Dyspepsia Rheumatism, etc.



Thoroughly cleanse the blood, which is the fountain of health, by using Dr. Pierce's Golden Medical Discovery, and good digestion, a fair skin, buoyant spirits, vital strength, and soundness of constitution will be established.

Golden Medical Discovery cures all humors from the common pimple, blotch, or eruption to the worst Scrofula, or blood-poison. Especially has it proven its efficacy in curing Salt-rheum or Tetter, Fever-sores, Hip-joint Disease, Scrofulous Sores and Swellings, Enlarged Glands, and Eating Ulcers.

Golden Medical Discovery cures Consumption (which is Scrofula of the Lungs), by its wonderful blood-purifying, invigorating, and nutritive properties. For Weak Lungs, Spitting of Blood, Shortness of Breath, Bronchitis, Severe Coughs, Asthma, and kindred affections, it is a sovereign remedy. It promptly cures the severest Coughs.

For Torpid Liver, Biliousness, or "Liver Complaint," Dyspepsia, and Indigestion, it is an unequalled remedy. Sold by druggists.

DR. PIERCE'S PELLETS — Are a Bilious and Cathartic, 25c. a vial, by druggists.

MURRAY CANAL

Notice to Bridge-Builders.

SEALED TENDERS addressed to the undersigned and endorsed "Tenders for Bridges, Murray Canal," will be received at this office until the arrival of the eastern and western mails on FRIDAY, 20th DAY OF AUGUST, next, for the construction of swing bridges at several places on the line of the Murray Canal. Those for the highway are to be a combination of iron and wood and the one for railway purposes to be of mild steel or wrought iron.

Plans, specifications and general conditions can be seen at this office on and after FRIDAY, 6th DAY OF AUGUST, next, where forms of tender can also be obtained.

Parties tendering are expected to have a practical knowledge of the class of works required, and are requested to bear in mind that tenders will not be considered unless made strickly in accordance with the printed forms, and—in the case of firms—except there are attached the actual signatures and nature of the occupation of each member of the same. Further, a bank deposit receipt for the sum of $250, for each bridge for which the offer is made, must accompany the tender, which sum shall be forfeited if the party tendering declines to enter into contract at the rates stated in the offer submitted.

The deposit receipt thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,

A. P. BRADLEY,
Secretary.

Department of Railways and Canals,
Ottawa, 27th July, 1886. 3d26

CAREFUL—COMFORTING

EPPS'S COCOA.

BREAKFAST

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack us wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

AUSTRALIAN WOODS.

A correspondent of the Montreal *Herald* writing from the Colonial Exhibition says :—

Queensland shows 427 specimens of timbers, of every size, quality and kind. There is the Bunya-Bunya (or "Monkey Pussle"), the pine cone, which produces a delicious nut, and which the natives will travel miles to procure Here too are the "biggest" logs in the entire exhibition, from the district of Moreton. One of these measures in girth 20 feet 5 inches and another 18 feet 8 inches, and each weighing five tons. Their grain is exceedingly pretty and the wood will bear the highest polish. These are named the Karri tree and some of them measure over 400 feet in height, and in some cases the stems are 300 feet high, measured from the ground to the first branch, and the circumference around the base measured 60 feet. Canada is proud of her birches, her oaks, maples and pines. But for greatness and grandeur she is excelled by this little colony in the Pacific.

The entrance gateway to the Western Australia Court is made of Jane wood, shingled with the oak or Casuarina. To the right of this porch may be seen a grove of Jarrah trees, and to the left the Karri woods. Here you stand in the presence of three giants of the forest, 300 to 400 feet in height, rivalled only by the Eucalyptus and the monsters of the grove of Mariposa. Jarrah is a very heavy wood, weighing one and a half ton to the 50 cubic feet, and is impervious to the sea worm and the white ant. Amongst the splendid specimens of this timber to be found in this court are a slab which had lain on the Bunbury beach for the last 36 years, washed by the waves, heated by the sun, and showered by the sand, and a huge block which had been absolutely under water for twenty-two years. There is a trophy, too, of massive beams, 21 feet high of Jarrah wood, surmounted by specimens of "Tuart" wood nearly as hard as iron. On this trophy there is a star with numerous rays composed of various colored woods marvellous to behold, and adorned with shields in white and red—woo-ma-gahs, dowarks boomerangs, kyleys—the latter arranged as river rays. On either side of the arch are two large blocks of yellow sandal wood, a marked contrast to the bright red of the Jarrah tree. Here, also, is a staffenden grass tree, 20 feet high, called a "Black-boy," and a lawyer's hat made of curious paper bark impervious to rain, as well as other grass trees, with the Kingees in flower, and a fine display of woods such as gum, morrel, tuart and native pear, well adapted for coach building and furniture. Conspicuous is a splendid wood case with glass widows made of a variety of native woods, and containing about three hundred beautiful specimens of the fauna of the colony and a most interesting exhibit of its birds and mammals.

MATTAWA.

Mattawa is the Indian name for the "meeting of the waters" and nestling in a vale, or glen at the junction of the Mattawa and Ottawa rivers is the pretty village of Mattawa. The Hudson's Bay Company has had a post here for upwards of sixty years and Mr. Colin Rankin, one of its most experienced servants, is now in charge. Mr. Gorman, of the firm of Messrs. Timmins & Gorman, one of the largest establishments, and Mr. A. M. Earl are, after the Hudson's Bay Company, the oldest settlers in Mattawa. The last named gentleman informs me that in 1869 there were only two white families in the village. To day I counted seven first-class stores, besides many others in smaller way, and all doing well. There is a population of perhaps 900. Mr. Earl, who seems to know the territory thoroughly, tells me that the country for hundreds of miles is practically surrounded by beautiful water systems. Twelve miles away is the Amable du port, then there is the Montreal river, and then again the Boesfrind, not yet fully explored, which is in fact a series of small lakes running for many miles north and northeast and draining a vast area of country. All these waters eventually find their way to the Ottawa. According to the same authority there is a large tract of good farming and yielding thirty bushels of fall wheat to the acre and other crops in proportion. A road is being constructed to these lands. Then the growth of timber is immense, and yields large supplies. White oak, four feet through, and cherry twenty inches diameter are common. There is timber enough in this district equal to the demands of many years to come. Silver mines have also been discovered; asbestos too, besides mica and other valuable minerals. Except in one instance, that of a silver mine, nothing has yet been done towards developing their resources.—*Monetary Times.*

THAT MONSTER RAFT.

HALIFAX, N. S., July 31.—The launch of the monster timber raft at Two Rivers, Cumberland, advertised for to-day, attracted the largest assemblage of people ever seen in that part of the country. At one o'clock all available vantage ground from which a view could be obtained, was fully occupied. The shores were quickly severed by axemen and amidst almost breathless anxiety the last one was cut away, but the raft did not show any signs of moving. The foreman gloomily shook his head and declared the first attempt a failure. Bitter disappointment was depicted on every face, and the launch declared by many an impossibility. The superintendent of the launching, Isaac Oliver, of St. John, did not lose confidence, however, and at once set to work to get things in readiness for another attempt. At midnight it is generally believed that this will be successful. The cause of the failure is variously conjectured. The most plausible reason advanced is that grease was put on the launchways too early and evaporated. This great raft has been under construction since January 1st. It is 420 feet long, 55 wide and 30 feet deep, weight 8,000 tons, and contains two and a half million superficial feet of piling and other timber. It is cigar-shaped, was designed by H. R. Robertson, and built under contract by B. B. Barnhill, of Two Rivers, for Wilson Godfrey, of New York. The timber is estimated to be worth $30,000.

IRON THAT WILL NOT RUST.

James S. C. Wells, in *Popular Science Monthly*, for July :—The liability of iron to rust is a great drawback to its use for many purposes, and the practical value of a process which will protect it, at a slight expense, is self-evident. That the process is successful in accomplishing this object seems no longer a matter of doubt, and at less cost than galvanizing or tinning. The color on cast and wrought iron is a bluish-grey, which to some may be objectionable, but, as the coating takes paint far better than untreated iron, this object is easily overcome, and with the assurance that the paint will remain, and not soon be thrown off as it is generally. For polished work the color is a lustrous blue-black, adding greatly to the beauty of the article treated. This process seems peculiarly will adapted for gas and water pipes. Any one has had occasion to use water which has passed through a new iron pipe, or one that has not been used for some time, knows how full of rust it is, and that only after months of constant use does it become clear again. With pipe coated with the magnetic oxide by the Bower-Barff process, no trouble of the kind can occur. The water runs pure from the first day, and if for any reason the pipes are emptied, and left so, there is no danger of their becoming coated with rust. Another important fact is, that the water coming through one of these rustless pipes is just as pure as when it entered, for the water can dissolve none of the coating of oxide, as it always does with lead or galvanized pipes. It is a well known fact that water running through lead pipes is very apt to contain lead in solution, and the continued use of such water causes lead-poisoning, for, although the amount of lead dissolved may be very small, still it accumulates in the system, and finally causes sickness and disease.

THE Burk's Falls *Arrow* says :—Messrs. S. & J. Armstrong have sold their mill at Burk's Falls, to Messrs. Saunders & McPherson, of Orillia, who expect to do an extensive cutting next season. They have taken possession and are cutting lumber for the Ontario Lumber Company, contracted for before the transfer of the mill. Business in the lumber trade is to be lively for the balance of the season.

SWAMP LANDS BEING RECLAIMED.

There are very many of the older residents of Bay City, who well recollect when all the land from the southern limits of Bay City to the northern limits of East Saginaw on the east side of the Saginaw river, and also all the land on the west side of the river from the northern limits of Saginaw City to the southern limits of Wenona, now West Bay City, was one continuous swamp for miles in width, and the railroads on either side of the river were built on embankments thrown up by the dredge or shovel, and the ditches were constantly filled with water on both sides of the tracks.

Very few passengers on these railroads, as they viewed the vast waste spread out before their vision, ever supposed these lands would possess any value for agricultural purposes, and in fact hundreds of acres were purchased by sportsmen to be retained as duck hunting privileges.

But mark the change! Hundreds of acres of these lands have been reclaimed, by a peculiar process, which was conceived by Judge Albert Miller, of this city, one of the oldest settlers in the valley, still living, and quite active, considering his years, and William Daglish, deceased. These parties became possessed of a lot of these lands, which was a continuous swamp, and on which the water stood the year round to a depth of from one to four or five feet. They dredged a deep and wide channel around several hundred acres of this swamp land, the channels being several feet below the lowest surface of the land. The ground dredged from the immense ditches was thrown up, and formed a heavy and high embankment on the outside of the ditches, on which several teams abreast might be driven, and which was of sufficient width to be proof against leakage; and when this was completed steam and windmill pumps, which combined threw 2,000 gallons of water per minute out of the ditch and over the embankment were set at work. In a very short time time the water was all pumped out of this immense territory which now resembles a great basin. Lateral ditches were run into the main ditch, and these drained the land constantly, and the pumps kept the ditches dry. The result is that the land has been found exceedingly productive, and enormous crops of corn and other farm products have been harvested each year.

The Holland farm on the west side of the river, containing 700 acres, has also been made after the same method, and a brickyard established thereon, which is now furnishing the brick for the new opera house here, and other mammoth brick blocks which are being erected.

T. H. McGraw & Co. have also a fine farm from the same land, and W. A. Beebe & Co. are progressing at present in good shape with the two and one-half miles of dredging on the east side of the Flint & Pere Marquette track for T. H. McGraw. The work when completed will reclaim over 1,000 of prairie land in Bay county. Mr. McGraw will put in a separate pump, and in less than three years will have a fine farm on land that has been considered almost worthless. The work this season on the and will cost over $6,000. About 300 acres of land on the west side of the Flint & Pere Marquette railroad, also belonging to T. H. Mc Graw, along the river, will be dredged around and put in shape for cultivation as soon as Beebe & Co. get through with the job they are at now. Mr. Azure, who has charge of Mr. McGraw's big farm, has clearly demonstrated that there is no better land in the United States, when properly drained and cultivated, than what was formerly a frog pond along the river.—*Bay City, Mich., Gazette.*

THE Maritime Chemical Pulp Company is the name of an industry shortly to be established in Chatham, N. B. Hamilton will be the headquarters for the company, which is to have a capital stock of $150,000 in 1,500 shares of $100 each. The applicants for incorporation are : John A. Fisher, Dundas; John Stewart and Alexander Bruce, Hamilton; and Arthur Lee, John Leys and Richard Brown, of Toronto. Messrs. Fisher, Stuart and Lee are to be the first directors, with A. A. Anderson as secretary.

ASH FOR CARRIAGE WORK.

An authority on carriage building says, in seasoning ash, we must take into consideration the large quantities used in carriage building, also the bulky nature of the timber whilst in its unconverted state, which compels us to use the simpliest and readiest means in seasoning without sacrificing the qualities of the timber. The best way to do this is to convert the bulk into plank as soon as possible, and, whilst seasoning to assist nature in every way without forcing, and when nearly seasoned to cut into sizes for use. For instance, brougham pillars, brackets, beds for under carriages, and especially the heavier seizes. Before stacking ash, it is well to see the character of the timber, for if it is of a twisted nature it must be stacked one plank over the other, if not it may be placed on edge or on end, which will season it better and quicker. Besides being used in framing and such parts, it is largely used for bent work, such as steamed rims for wheels, futchels for carriages, top-sall's in white chapef's segment pieces in brougham fronts. But the action of steam in disolving the gummy matters within it deprives it of its native toughness.—*Timber Trades Journal.*

WOOD WOOL.

For some time past attention has been directed to a very interesting product consisting of extremely thin and slender shavings of wood that are comparable to paper cut for packing. It is known by name of "wood wool." This product was first introdueed into France as a packing material. It weighs about 40 or 50 per cent less than the materials generally used for such a purpose. Its beautiful appearance, its fineness and its extreme cleaness at once brought it into favor with shippers. It was afterward found that the material was well adapted for the manufacture of mattresses, for bedding for cattle, for the filteration of liquids and for stuffing horse collars, &c., the most suitable species of wood being selected for each of these purposes. Its elasticity causes it to be considered as the best material for bedding after horsehair, and it is even preferable to any other substance when it is derived from resinous wood, since it does not absorb moisture. In workshops wood wool is tending to replace cotton-waste for cleaning machines, and it has likewise found an application on the rolling stock of railways for lubricating car axels While it has the same property that cotton-waste has of absorbing oil it costs ten times less than that material. Its use is said to be rapidly growing in Austria and Germany and also in France.

A BIG POPLAR.

The Cornersville (Tenn.) correspondent of the Marshall *Gazette*, writing to that paper says:—"The big poplar tree in Dogget's cove has been a noted landmark for nearly 70 years, and is more talked of, perhaps, than any tree in the State. Its size has from time to time been given all the way from 29 to 33 feet in circumference. Passing that way recently I went to the tree, viewed it and measured it carefully. The bark, which was three or four inches thick, had most of it fallen off, and I found it to be 26 feet and, perhaps, two inches in circumference, clear of any spurs. It has the appearance of being slightly hollow, and is in dying condition. The trunk is fully 50 feet to the first limb. It is a monster tree and there is a vast amount of good timber in it, but it will soon be ruined. Thie section has always been noted for its large trees. A beech tree standing on the old country line, about five miles north west from this place, and which was blown down some six or eight years ago, had a perfectly straight trunk of nearly 60 feet, clear of limbs, and was 5 feet 5 inches in diometer, and in consequence, difficult and hard to handle."

A TRACT of pine, comprising 24,000,000 feet, situated on the west fork of Chippewa river, Wis., has been sold to the Mississippi Logging Company for $74,000. Another purchase of H. C. Putman was made by Fred. Weyerhauser, for the Mississippi Logging Company, for $70 000. The same company is reported as buying heavily on the west fork of the Chippewa.

Chips.

ANDREW CLANAHAN'S planing mill, at Glencoe, Ont., was burned July 23rd.

THE Langford & Hall Lumber Company, Fulton, Ill., quotes sawdust on its price-list. The price is $10 for a common car load.

THE Messrs. Rathbun are raising their wharf at Picton, and will erect a freight house 100 by 28 feet and make other improvements.

THE export lumber freight transactions at Quebec, for the week ending Aug. 5th, were as follows: Quebec to Southampton, 800 loads; timber, 205; remainder deals, 47s. 6d.

THE oldest and largest tree in the world is said to stand near the foot of Mount Ætna. It is 212 feet in circumference, and is a chestnut of course.

THE H. Witbeck Company has had 10,000,000 feet of standing pine on Sturgeon river, Menominee district, scorched by recent forest fires, and it will be cut as soon as possible—probably the coming winter.

A FEW weeks ago, we learned that a leading Australian brewer had placed a large order in London for casks. We now learn that the same man wishes to buy or contract for quantities of white oak staves.

IT is estimated that 40,000,000 feet of lumber will be used at Duluth in building operations, including the Manitoba elevator, the Lehigh coal dock at West Superior, the Omaha, Northern Pacific, St. Paul and Duluth and private docks.

W. J. BAXTER, of Saginaw, Mich., has completed the inspection and shipping of 250,000 feet of white pine sawed timber 7x14, and 26 feet long for Flatt, Bradley & Co., and goes by rail to Quebec, and thence to Liverpool, England, which point it is expected to reach September 1st next.

THE freight agent of the Canadian Pacific railway, Mr. G. M. Bosworth, states that within the past two months the lumber merchants in the districts around Georgian bay and Lake Nipissing have forwarded to Montreal no less than 3,500 car loads of square timber, representing two million square feet.

THE *Boot and Shoe Recorder* says:—Hardly had it been discovered that paper could successfully take the place of leather as a substitute in many cases, before the hatters were notified that, by a new process of manipulation with wood pulp (which is the base of certain kinds of paper), hats can be produced. Thus extremes meet with wooden hats and wooden shoes, especially if there is a blockhead uniting them.

CANOES of wood pulp are now being constructed in Sweden, by a patented method, very nice-looking and handsomely shaped, and costing about 50 to 60 kronor each. The pulp is waterproof, and is put layer by layer on to a wooden model, where it dries; the model is then withdrawn, and deck, keel and rudder are added. It is furnished with water-tight bulkheads, and in the middle of the deck there is an opening in which the canoer sits and paddles.

Drowned at Ranney Falls.

CAMPBELLFORD, Ont., July 31.—A riverman named Joel Redden, working for Gilmour & Co., was drowned at Ranney Falls, half a mile below Campbellford, this morning. After the gang had finished "tailing" the logs through, it seems that he and a companion attempted to shoot the rapids, but the boat filled, the men were precipitated into the water and Redden, being unable to swim, was drowned. His companion got ashore. The body has not yet been recovered.

LET CANADIANS TAKE HEED.

An International Exhibition, to be held in June, 1887, is announced for Adelaide, the capital of South Australia.

This will furnish an opportunity for American manufacturers to make headway with their wares in Australia which should not be neglected. At the Melbourne exhibition in 1880 there were three hundred and sixty-six American exhibitors, and the proportion of medals and diplomas awarded to them was very large. At the Sydney exhibition in 1879 the Americans also secured a large share of the symbols of merit.

We already compete with Great Britain in the markets of her colonies for many important articles, particularly in hardware, prints and woodenware. These exhibitions should be utilized to the fullest extent for the purpose of fostering and extending our trade. If Congress can do anything to help this along it would be a good idea.

Of the Adelaide exhibition it is said the Prince of Wales will be president, Sir Samuel Davenport executive commissioner, and Mr. George Collins Levey (who represented Victoria, Australia, at the Centennial), secretary. The whole matter of exhibitions has now become so systematized that nearly all large manufacturers are able at slight expense and with little trouble to place a full line of samples en route for any city on the face of the earth. It is well-known that exhibiting anywhere pays, and Adelaide will be no exception to the rule.—*N. Y. Herald.*

The Forestry Report.

Mr. R. W. Phipps writes as follows to the *Globe*:—"I should like, through your columns to state to the numerous correspondents who writing for this years forestry report, ask that the two former reports be sent them, that those editions have been distributed and that copies are now hardly obtainable. Some of the present edition are still on hand, and I should be glad if those farmers who desire them would send their addresses within the next two or three weeks when copies will be sent them free. Those who obtain this number would do well to have it bound, as an account of the list of trees and other new forestry matter, it will be very valuable for reference."

THE Monetary *Times* says:—The demand for all the product of our forests is dull at present, but there is good reason to suppose that the United States, before the season closes, will buy an increasing quantity of sawed lumber. The demand from England is dullness itself. The trade of the mother country—in the great staples at least—and including agriculture as a trade—has settled down into a position of hopelessness and serious reduction of profit. This is the case, notwithstanding the fact that the volume of England's production and trade goes steadily on, and represented by figures of prodigious dimensions.

MR. BEAUMONT has sold the point adjoining the Rathbun property on the Gananoque river front; price $1,600. This gives the Rathbun company the whole river frontage.

OVER WORKED Women

For "worn-out," "run-down," debilitated school teachers, milliners, seamstresses, housekeepers, and over-worked women generally, Dr. Pierce's Favorite Prescription is the best of all restorative tonics. It is not a "Cure-all," but admirably fulfills a singleness of purpose, being a most potent Specific for all those Chronic Weaknesses and Diseases peculiar to women. It is a powerful, general as well as uterine, tonic and nervine, and imparts vigor and strength to the whole system. It promptly cures weakness of stomach, indigestion, bloating, weak back, nervous prostration, debility and sleeplessness, in either sex. Favorite Prescription is sold by druggists under our *positive guarantee*. See wrapper around bottle. **Price $1.00, or six bottles for $5.00.**

A large treatise on Diseases of Women, profusely illustrated with colored plates and numerous wood-cuts, sent for 10 cents in stamps. Address, WORLD'S DISPENSARY MEDICAL ASSOCIATION, 663 Main Street, Buffalo, N. Y.

SICK HEADACHE, Bilious Headache, and Constipation, promptly cured by Dr. Pierce's Pellets. 25c. a vial, by druggists.

THE
SECURITY
MUTUAL
Benefit Society
OF NEW YORK,
No. 233 Broadway, New York.

The Security Mutual Benefit Society of New York is one of the few assessment life insurance companies that has attained conspicuous success. "Slow and Sure" has been the motto of its managers, and they have preferred to build up a solid foundation with

Strictly Frst-Class Male Risks,

rather than grow fast numerically at the expense of safety and become burdened with unsafe risks, heavy mortality and frequent assessments.

The members of this society elect their own officers annually, cannot be assessed except for death losses occurring after the surplus fund is exhausted, are guaranteed against dishonest management by the Agency Security and Guaranty Company, a responsible corporation organized upon the unlimited plan, and having one hundred thousand dollars capital, and who also

GUARANTEE THE PERPETUITY OF THE SOCIETY FOR 48 YEARS.

Considering the elements of safety and permanency which it affords, no organization ever before offered the substantial benefits of life insurance at so little cost to the insured.

ONLY TWELVE ASSESSMENTS

have been levied from 1881 to 1886, averaging three a year, and making the cost for assessments to a man of 40 years

Less Than Five Dollars a Year

for each $1,000 of insurance.

16 11 SENDFORCIRCULARS.

A GIFT Send 10 cents postage, and we will mail you *free* a royal, valuable, sample box of goods that will put you in the way of making *more money* at once than anything else in America. PETERBOROUGH, Ont., AUGUST 16, 1886.

THE TRADE.

REPORTS from the English markets continue to be of a very leaden hue, and the silver lining is not perceptibly larger than it has been for sometime. Commenting on the London market, a writer conversant with the business descants on the "utter stagnation of trade." That phrase looks strong and may be hyperbolic to a certain extent. Yet the evidences of sluggishness are plain. There certainly appears to be no sufficient grounds for hope, according to reports viewed, for an immediate revival of the trade in England.

When we turn to this side of the Atlantic things look somewhat brighter. Generally, business prospects are brightening up, and the general press uses the better prospects for a theme for its articles. A general revival of profitable business activity would be shared by the lumber trade and the signs of that revival will be welcome. Across the border the condition of business is much the same as in Canada. No doubt the labor troubles injured, what promised, at the outset, to be a profitable season, but a better feeling seems to exist. As yet, however, there is a disposition to wait to see which way the feline will leap before going to any lengths. That able Chicago trade paper, the *Northwestern Lumberman*, is hopeful, and in its issue of August 7th gives its views as follows:—

"From one standpoint the prospect that higher prices may soon be obtained for lumber was never brighter. Throughout the country the stocks in retail yards are very light. A few years ago the retail dealer made it a point to stock up at stated intervals very much as dealers in merchandise think that at certain seasons they must lay in a stock of goods. The retail lumber dealer, however, has changed his method of buying. He purchases from hand to mouth. For the average retailer a car load of lumber is a good purchase. He has learned to take advantage of railway facilities. If within easy reach of a distributing point an order writen to-day will start a car load of lumber on the way to-morrow. For this reason the amount of lumber carried in the retail yards is comparatively small, and it is doubtful if the retail dealer will ever again fall back on the custom of buying heavy bills.

"If the wholesale markets are investigated it will be found that there is no surplus stock in that direction. Of course there is lumber and lumber, but it is stated by buyers that it is by no means an easy task to find good dry stock in desirable quantities. If the hunt were for coarse stock it would be different, but a majority of the dealers in the markets west of Chicago have their eyes on eastern trade,—a trade that demands well-manufactured stock from a good quality of timber. Several Chicago dealers are also reaching east with their long arms. The wonder is, not that every man who can sell lumber in the eastern states does so, but that the consumption of good lumber in those states is so large. The demand for good lumber to go east is leaving a residue in many a yard that is neither desirable or readily salable.

"As if to help the lumber dealer out the the clouds withhold their rain. Should the drouth continue for the next three weeks a large number of mills will shut down for want of logs. It must be remembered that never in the history of the lumber business in the northwest were the logging streams driven so clean as they were last year. Not only did all the logs come down but it was often the case that the mill booms were cleaned out before the sawing season ended. As a result mills were obliged to do little or no sawing until new logs came to hand. Were heavy rains to set in now there are plenty of logs on the head waters which would not reach the saw the present season, even though it were miraculously prolonged. The most lively imagination cannot figure out how there can be any but an ordinary-sized stock of lumber on hand when the mills shut down for the season. There will probably be no scarcity of lumber, but any time from now until new lumber is plentifully piled on the docks next season there can be no surplus to warrant dealers climbing over one another's heads in order to see who can sell cheapest.

"Owing to the conditions briefly stated above, certain grades of lumber in certain markets have slightly advanced. Whether the movement will extend generally is past prophesying. By special pleading the conclusion might usually be reached that the general law of trade has no control over the lumber trade There are dealers in Toronto who sell lumber though the heavens fall; there are Mississippi river dealers who will meet Chicago men, and there are rail-mill men whose highest ambition on earth is apparently to understell everybody. With these combinations in the field the future of the lumber trade is difficult to anticipate. The manufacturers always stand ready for higher prices, it is said, but believe the east shore dealers will be fairly satisfied if the $9 basis for dimension is sustained on the Chicago market; and without much doubt it will be. The purely jobber wants higher prices, and he wants them badly. He may meet competition and cut the insides out of his own pocket book, still, all the same, he longs for prices that will afford him more profit than he is making now. And he knows that in order to get that profit prices must go up. He has abandoned the hope even of jumping on to the necks of the manufacturers with any effect. He has learned within the last two years that typical lumber manufacturer has become like the adamantine rock so far as his idea of prices goes.

"As the diagnosis has shown, there are conflicting elements. The manufacturer is doing but little complaining just now. The jobber would whoop up prices in prices in a York minute were it in his power. The retailer wants no higher prices at distributing points, claiming that from his customers he would be unable to obtain a corresponding advance. The way the cat will jump will be seen later on."

THE REAL AGAINST THE FALSE.

The manufacturers and shippers of cherry have for a time complained that the demand throughout the east for their product was decreasing, and prices were not as firm as formerly. It is also conceded that the demand for cherry has increased throughout the west, while buyers in this section are said to be willing to pay asking prices at the mills for good stocks. An inquiry into the situation in the east reveals a few features which are presented for consideration. It is a trait of human nature to imitate in order to gain a desired effect at a reduced price. A few years ago it was the custom to use cherry in the natural color, or strained just enough to give the wood an even color, slightly darker than the original wood. This process of filling and finishing did not rob the wood of its natural beauty, and a glance revealed, even to a casual observer, the true nature of a most beautiful species of timber. It was about this time that mahogany began to assume an important place in the estimation of manufacturers, especially in the furniture line, and as that wood was expensive there was an immediate and decisive disposition to imitate it. It was found that cherry, by being deeply stained, could be made to so closely resemble mahogany as to require an expert to tell the difference. The process is known as mahogonizing, and it has been adapted in a general way for the finishing of house decorations and even for store work.

The next step was to imitate cherry, and for this purpose popular is used mostly when intended for house finish, and red birch furniture. The habit of staining real cherry to a blood red, or in other words totally obliterating the natural shade of the wood, has paved the way to palming off other woods, deeply stained, upon many unsuspecting purchasers. It has also resulted in a marked diminution in the demand for cherry; and while the manufacturer may be able to increase his profits by a bare pretension, the handlers of the genuine article are forced to complete with a cheap adversary.

This condition of affairs is the direct result of a demand for a grade of cherry superior to the work of nature—a quality of lumber absolutely free from defects in the nature of gum streaks, the very presence of which bears witness to the genuineness of the article. To offset these alleged defects the finisher has stained cherry to a shade so dark that other and cheaper woods could be used to equal advantage, and there are many users of household furniture who take great pride in what they suppose to be cherry sets, who are in reality idolizing a concoction of birch lumber and cherry stain, for which they paid a price nearly, if not fully, sufficient to have purchased a much handsomer article of cherry.

Cherry in its natural color, when dressed, is a pale pink, and if finished without stain, or with just sufficient to give the entire surface an even shade, can never be successfully imitated by any of the cheap woods, and it need never be feared but that it will stand on its own merits.—*Northwestern Lumberman.*

THE OUTCOME ON AN INVENTION.

Readers of the *Lumberman* may remember that a few years there in its colums a machine for compressing sawdust, and from occasional inquiries it is evident that the invention is still of interest to people who are of the opinion that sawdust ought to be utilized.

The inventor of the machine was Mr. W. H. Smith, a gentleman of both general and special ability, and who during the war, was a government engineer of high repute. For years following the close of the war he studied on the machine of which we write. Level headed ordinarily, yet an inventor's enthusiasm took possession of him, and he could see millions in the child of his brain. There was no doubt, in his mind, but the invention would revolotionize trade. He would make sawdust into blocks of fuel, into pulleys, into fence posts, and even into railway ties. Sawdust fuel would become an article of commerce. Samples of it were burned in the *Lumberman* office with the best of results, and the engineers in the city who were furnished with a few hundred pounds to test against the same weight of coal reccommended the new fuel in high terms. The use of the machine would not stop on sawdust, however. Oats, salt, bran, hay, cotton—in fact any commodity that in its natural state was to bulky for profitable transportation—could be compressed. Special emphasis was laid on bran. A car load or so was put through the machine and shipped to the English market as a test, and while the success of the process was proved, word came back that the bran was worthless; that the miller had taken too much of the food element out of it, and had left nothing but a dry shell that could only stimulate the animals which ate it by scratching their insides. This advice spoke well for the Minneapolis miller from whose mill the bran was taken, but it was a crusher on the would be bran exporter.

Mr. Smith made preparations to build a machine at a foundry on the west side of the city, and for months worked hard. During this period he associated with him Mr. James L. Houghtalling, a gentleman who had both money and leisure and who at that time was treasurer of the Mackinaw Lumber Company. The machine on trial exhibitions worked fairly satisfactorily, but less of a mechanic than its inventor was could see that its construction was faulty. Tremendous power was required, and parts of the machinery were too delicate to withstand constant use. But improvements were made until it was thought that the machine could be put on the market, and one was built for the big saw-mill concern, the Rathburn Company, Deseronto, Ont. This company ran a line of steamers, and it was its intension to use sawdust fuel in the steamer furnaces. Whether there was any temporary success in the scheme we have never learned. At present however, the compressor stands idle, for the eason, it is safe to say, that it is unable to stand the heavy work required of it.

Two compressors were built. One, as stated above, is idle in Canada; the original machine is standing under a shed on the west side; Mr. Smith, the inventor, is dead; and Mr. Houghtaling is now engaged in a business that gives him no time to fool with sawdust compressors. The machine, practically, has been a dead failure. It was conceived in a bright brain, but it consumed the years, and we know not but the life of the inventor. To say the least, he died a dissappointed man. He saw the work of years of mature manhood come to nought. The sawdust compressor was not only an ambition destroyer but a money eater. Mr. Houghtalling sank $15,000 in the enterprise, and how much it pulled from the pockets of others we have no means of knowing.

Notwithstanding the dismal record presented above the LUMBERMAN is of the opinion that there would be big money in the invention were it perfected. The trouble is with the machine, and not with the process. The principle is all right; and the next man who attempts to carry it out we trust will have a less thorney road than those who have gone before him.—*Northwestern Lumberman.*

FOREST FIRES IN MICHIGAN.

BAY CITY, Mich., Aug. 11.—Despatches to this city announce that terrible forest fires are raging along the entire line of the Michigan central railroad, from Mackinac city to Pinconing, in Montmorency and Otsego counties. standing timber has been destroyed and the fires are prevailing continually. Villages are threatened unless rain comes soon. The conductors report the scene at night both fearful and interesting.

ISHPEMING, Mich., Aug. 11.—The forest fires have done great damage in various parts of the upper peninsula. At Barraga, Choicolay and other points along the Chicago and Northwestern railway, there have been terrible fires Nearly a million feet of standing pine have been destroyed. Unless rain comes soon there will be no more greater devastation.

Two large fly wheels in the Port Arthur Lumbering Company's mill, at Port Arthur, Ont., recently burst and flew in all directions. The wheels are six feet in diameter, and revolving about 90 times to the minute. Though several men were working a few feet away no one was injured.

RICHARD COX, an Englishman, who works on the steambarge Walker Lilly, was loading ties at the Rockland mills, Ottawa, when a pile of lumber, beneath which he was standing, gave way, and the whole weight of the lumber fell upon him, killing him instantly. Cox had only been in the country a short time.

LOSS OF LIFE BY FOREST FIRES.

MILWAUKEE, Aug. 11.—Though the forests in the northern tier of counties in this state are still ablaze, and are likely to remain on fire until rains quench the flames, the danger to the villages and towns is over unless heavy gales should sweep down upon them. While not over a dozen cases of human cremation are reported, it is believed that many backwoods' men and families remote from settlement cannot possibly have escaped. The fatality to live stock has been terrible Hundreds of charred bodies of cattle lie on the blackened track of the devasting cyclone of fire. It is estimated that in Calumet, Clark, Marathon and a few adjacent counties 500 families are rendered homeless and and will suffer unless immediate relief is sent them. Many of these people had narrow escapes from death, having hidden in wells o submerged themselves up to their necks in streams with wet blankets covering their heads until the fire passed. In some places the fire swooped down so suddenly upon the people that they barely had time to take this method of safety. In other places the roar of the flames was heard for miles, and the terror-stricken people fleed madly before the flames to neighboring villages and towns. The loss can not even be estimated. Hundreds of homes, dozens of saw mills, lumber camps and mil ions of feet of lumber are in ashes. Acres upon ac es of ripening grain were laid waste.

To-night's advices are that the fires are abating considerably by running into clearings and be cause the wind has died out. However, fears are entertained of a repetition should high winds prevail again before rain appears Along the valley division of the Chicago, Milwaukee & St Paul railway, heavy rain to-day extinguished all the flames, saving the largest cranberry marshes in that section. To-day the suffocating clouds of smoke from the burning forests were borne by north winds as far south as Milwaukee. On the lakes near Green Bay, Sturgeon Bay, and even further south, the smoke clouds are so dense that the sun is ob scured, and vessels experience extreme difficulty in navigating it being impossible to see 400 feet ahead at midday.

CIRCULATION IN A STEAM BOILER.

The great influence which the circulation of the water in a steam boiler, when it is in operation, exercises upon its efficiency, its tendency to foul up, and its liability to various annoying defects, does not seem to be fully unders ood o appreciated by many to whom it is of the greatest importance. Were it not for the fact that heat applied to the under side of a body of water is communicated to it, thereby expanding it and causing it to rise through the colder water above and producing a circulation, it would be prac tically impossible to generate steam in the ordinary manner. The efficiency of any given area of heating surface depends almost wholly upon the perfection of the circulation of the water in contact with it. This will probably be better appreciated when it is stated that the experiment has been perf rmed of immersing a cubical metalic box in water and heating it from the inside. The horizontal upper surface of the box generated more than twice as much steam per square foot of surface as the perpendicular sides while the bottom or lower side generated none at all. This was due to the fact that the steam bubbles or vesicles formed in contact with the upper surface, had nothing to interfere with their prompt liberation from that surface, the heated water was equally free to rise its place being immediately filled with a fresh supply of colder water thus forming a rapid circulation; the operation went on with greater difficulty in contact with the vertical surfaces, while with the lower horizontal surface, the steam as formed would have a tendency to hug the surface, and prevent the contact of water with it, thus effectually preventing any circulation. When these facts are appreciated it will be readily seen how essential it is to the proper performance of a boiler that the water spaces should be large and as free from obstruction as possible, in order that the wa er may have opportunity to circulate rapidly, and the steam when formed be disengaged as freely and quietly as possible.

Comparatively few years ago, it was the universal practice to crowd as many tubes into a horizontal boiler as could be otten into it They were set in zig zag rows, to enable the greatest number to be put into a given space, on the theory that the more heating surface the more steam the boiler would make, and the natural consequence was the spaces between tubes and shells soon became filled up with scale and sediment, the result being overheated plates, and leaky seams and tubes, while the steaming capac ty of the b iler was greatly reduced. Of late years, however, the fact is beginning to be appreciated that tube surface is not heating surface unless it has plenty of room to act as such, and consequently the number put into boilers of any given size is less; they are arranged in a more rational manner and as a natural result the boiler steams better, and is more easily kept clean, less repairs are necessary, and the life of the boiler is greatly prolonged.—*Locomotive.*

THE LUMBER TR DE.

A *Free Press* representative visited the different mills on the Chaudiere this forenoon to see how the lumber trade was progressing. After conversing with the diffe ent lumbermen and managers it was ascertained that the business was more active this year than last season, and prices were on the whole better. For the past few days there was a lull in the trade and sales were few. Little or nothing has been done in square timber, but a few sales of lumber were effected. An effort is being made to raise the export duty from $2, which it is at present, to $3 per thousand feet. It will be remembered that last session the duty was raised $1 which made it $2, and therefore equal to the duty imp sed by the United States on sawn lumber entering there. Canadian lumbermen have discovered that $2 on logs is not sufficient to meet the $2 imposed by the United States on lumbe. It is for this reason, a few thousand feet are never missed in logs, while the lumber can be exactly measured. In this way the correct number of feet is taken as regards lumber while it is the very reverse respecting sawn lumber. Our lumbermen therefore think that it will tak $3 export duty per thousand feet on logs to meet the imposition of $2 per thousand feet import duty by the Americans on sawn lumber. On the Georgian Bay there are quite a number of American lumbermen operating there. They take their logs across to the States by paying the export duty of $2, and in this way take the work of sawing it away from Canada. The $2 American import duty on sawn lumber cannot check tnis. The Canadian lumbermen think that the $3 export duty on logs will meet the whole trouble. At all events representations to the Government will be made to this effect.

All the mills are working full time. Messrs. Bronson & Co. have opened up a new limit on the Desmoine, and operations will commence there this winter. Their yard was entirely cleared out this summer, and now they have nothing to dispose of save this summer's cut Taking it all in all the lumbermen are particularly happy over the result of trade so far.—*Ottawa Free Press.*

ONE OF THE MOST INTERESTING.

The *Builder*, a London, Eng., journal, thus refers to one of the machines in the exhibit of the Wm. Hamilton Manufacturing Company at the Colonial Exhibition:—"The Hamilton Manufacturing Company, of Peterborough, Ont., have in motion one of Covel's Patent Automatic Saw-sharpening machines for circulars and mill webs. The sharpening is done by an emery wheel in the usual way but when the saw is once fixed it requires no further attention till completed. An additional advantage in this machine is that the depth of gullet and sharpening of each tooth is absolutely the same—a result quite unattainable in machines guided by hand. Any desired depth of gullet or rake on tooth can be obtained at will. This machine can be used for sharpening large band-saw blades and taken altogether, it must be pronounced one of the most interesting machines in the exhibition."

SEVERAL gangs of men have arrived at Maniwaki, Quebec, en route to the upper depots of Messrs. Hamilton Bros., and Messrs. Gilmour & Co.

CROPS IN MANITOBA

WINNIPEG, Aug. 9.—Hon. S. C. Wood and party have returned after travelling five or six hundred miles in the Province. They report that they found the crops in Springfield and north-east of Winnipeg pretty light in the straw and well-headed, and an average as far as the yield is concerned. In Birtle and Shoal Lake districts and around Minnedosa they found the grain well headed, good length of straw and more than an average yield. In Portage la Prairie district they found a very large average under wheat and the crop very good. It was a little shorter in the straw than usual, but will undoubtedly yield well. The same remarks would apply to the Carberry district. In the neighborhood of Brandon, north and south of the track for about four miles, the wheat crop is very poor, the straw being very short. Passing on to Plum Creek settlement the crops are very good, the wheat crop especially. From Plum Creek to Delaware they found an average crop, the grain being well headed, and the yield will doubtless be large. The crops around Boissevain and vicinity are good, and also at Nelson and vicinity, where they will be better than an average. Around Morden and on the Mennonite reserve they are light, the straw being very short, but the head is good and the yield will be fair. They noticed wherever they went that where wheat was sown on backset land or summer fallow the crop was good and little damage had occurred from the dry season, the only injury being the shortness of the straw. Wherever wheat was sown on stubble land the straw was very short. In districts where they saw the best crops they also found a very large acreage of summer fallow being prepared for next year. They unanimously reached the conclusion that this year's crop will be the most profitable one that this Province has had for many years. They found the farmers wherever they went hopeful and cheerful.—*Mail.*

ATTEMPTED MURDER.

BRANTFORD, Aug. 7.—Yesterday afternoon, between five and six o'clock, a man called at the residence of Mr. Geo. Massecar, Wellington street, rang the bell, which was answered by Mrs. Massecar, and enquired if Mr. Massecar was home. Mrs. Massecar replied no, but she expected him shortly, and requested the stranger to wait till he came. He said he would call again, and asked for a glass of water. Mrs. Massecar turned to get the water, but no sooner had she turned than the stranger shot her. She fell to the floor unconscious. On regaining consciousness she found the door closed and the man gone. She managed to alarm one of the neighbours, who came to her assistance and a doctor was immediately summoned. The ball struck the thick part of the left arm between the shoulder and the elbow. No serious result is anticipated. The stranger was about 35 years of age, dressed in black clothing. None of the neighbours nor children playing around the house saw the man nor heard the shot fired.

MISCELLANEOUS NOTES.

BOSTON, Mass., Aug. 10.—P. F. Williams, Russel, Sheen, & Co., lumber dealers have failed, and the following firms have failed in consequence: Allen & Noble, hard-ware dealers; Gerrish & O'Brien, furniture dealers; Thos. F. Brown & Co., furniture; L. E. Pierce, furniture, all of Boston; and the Lewiston steam mills, of Lewiston, Maine. The combined liabilities are $500,000.

WASHINGTON, D.C., Aug. 10.—The spring wheat returns of the Department of Agriculture for Aug. 1st show an improvement in condition in Iowa, a small decline in Wisconsin and Nebraska and a heavy production in Dakota. The causes of deterioration are drought and clinch bug. The heat has been excessive in many districts that have produced a fair yield.

COBOURG, Ont., Aug. 10.—A party of young men left here yesterday for a week's camping in Rice Lake, and to-day one of them, named Joseph McCulloch, of this town, took his boat out into the lake with the intention of having a swim, and after jumping into the water was unable to reach the boat, and was drowned before help could reach him. His body was brought in by train to-night. This is the fifth drowning accident in this vicinity this season.

PALMERSTON, Ont., Aug. 10.—License Inspector Fisher paid an official visit to town to-night. While putting his horse up at one of the hotels a stranger came up and asked him if he was the License Inspector. Being answered in the affirmative, he dealt him several blows with a club, cutting him on the head and shoulders. His injuries are not serious. The stranger, whose name is at present unknown, escaped.

MONTREAL Aug. 9.—Cure Marecaal, of the parish church of Notre Dame de Graces, at the morning service yesterday advised his flock earnestly at the approaching elections to vote for the best candidate, and expressed a sincere hope that no other considerations would weigh with them than a solemn desire to do their duty to the Almighty. He took occasion to revert to the fact which he extremely regretted, that some of the parishioners had a picture of Louis Riel with a rope around his neck in juxtaposition to sacred pictures. He also stated that Louis Riel could not be a martyr, as he had persecuted both the priests and the Church.

Wanted.

THREE HUNDRED THOUSAND feet of dry inch basswood culls.

BELDEN & McDOWELL,
Syracuse, N. Y.
3L14

TIMBER LIMITS.

ENDERS for timber limits on Georgian Bay, Muskoka, Black and Trent Rivers, Canada; nearly 270 square miles, containing about 260,000,000 feet pine; also for four saw mills on Black and Trent Rivers, will be received up to the 8th september, 1886. For details and terms apply to J. D. SMITH, Ferlon Falls, Ont., or the BANK OF TORONTO, Toronto or Port Hope, Canada. 3L15—6w32

For Sale at a Sacrifice.

A SAW MILL

SITUATED in excellent locality with an attachment of 200 acres of well timbered land through which flows the Nottawasaga river. Best water privilege in Simcoe. Capacity of mill eight thousand feet daily. Enough custom work to pay running expenses. Satisfactory reasons for selling, Box 60, Alliston, Ont. 2L13

GEORGE GALL

WHOLESALE and RETAIL

EVERGREEN WINDBREAKS.

The following is from the Ontario forestry report by Mr. R. W. Phipps :—

We know from long experience that the summer storms, the early frosts, and the fierce unrelenting winter blizzards do pass by fields surrounded by growing trees, uninjured and unscathed.—*Judge C. E. Whiting.*

Throughout a large extent of Ontario, considering how much is already cleared of the original forest, with the exception here and there, of some small portions, and the decaying condition of many of these, where cattle have been allowed to destroy all chance of forest perpetuation, it is plain, that unless trees be planted, the surface of the country must soon largely resemble a wind-swept plain. The resultant evils, agricultural and other, of this state of affairs cannot be too frequently impressed on our minds.

In our latitude, one of the principal of these, is necessarily, the additional cold experienced in winter. Every Canadian has observed, that in the absence of wind a low thermometer is comparatively little noticed. In the deep forest where wind was not, and four feet of snow overlaid the ground, I have passed days, time and again, working without gloves, at twenty degrees below zero. "In the Arctic regions," says Dr. Kane, "I can stand a journey at forty degrees below zero, but remember, no wind."

An evil to agriculture, perhaps even greater in a treeless country, is found in the injurious dryness occasioned in the soil by an uninterrupted wind-course. When the reviving showers of summer fall on the thirsty ground, the beneficial result to vegetation is easily seen —it is well-known and undeniable, and the farmer is apt to calculate how great would be the benefit if, for a week or two, his wheat and clover would thrive as they appear to have done within the past twenty-four hours. The fact is they would continue so to thrive, had we not interfered with those operations of nature, which, in this our climate of extreme heat and cold, are needed for the growing plant. When the protection afforded by forests is altogether destroyed, in a country like Ontario, the course of the wind over the surface of the land withdraws the moisture too rapidly from the soil. The moisture given by a summer shower in conditions favorable to agriculture should remain near the surface for a length of time, until dissipated by slow descent to the water courses below, or gradual uprising to the air above. During this process of slow movement of moisture through the warm summer soil, growth proceeds with its utmost vigor, and one the chief objects of partial shelter is to keep the ground in this favorable condition during the growing period.

When the earth is deprived of the natural shelter given by portions of forest, and the natural moisture too quickly absorbed in the following way: The soil parts with a portion of its moisture to the stratum of air passing immediately above, which passing on, is immediately succeeded by another body of air equally dry, which absorbs another portion, and this in its turn is succeeded by another. As long in fact, as the wind blows briskly across the soil, so long the process of evaporation continues, occasioning necessarily great loss of fertility, compared with that obtainable in better sheltered grounds. This cause has much to do with the often observed fact, that growth is by no means so strong, vigorous, or lucrative to-day, even on new land, in the same locality, as it used to be on similar soil, when the country had been recently settled, and sheltering forests existed in all directions.

We cannot at once expect to see a general commencement to replace those portions of woods, which, long since cut down, experience teaches us had better been allowed to stand. The work of replanting many thousands of acres would be vast. But there is a method whereby, without expense beyond a sum quite within the means of most agriculturists, much of the benefits formerly obtained by the forest shelter might be again secured, and yet the husbandman retain his acres for plough or pasture almost in undiminished extent. This method is simply the use of evergreen windbreaks.

Whoever chooses to take a little time now for this purpose can, in a few years have his fram protected on the north, west, or whichever are its most exposed sides, by beautiful walls of verdure, giving the property an additional value twenty times in amount that which the necessary time and labor will cost him, and giving a shelter from wind, a warmth in winter, and an increase in the return of many of his crops, far beyond what is generally imagined.

It is now that this pains should be taken, for our trees are not increasing. Many small forests, now giving shelter, are yearly being cut down, some because want of care has rendered them impossible now to preserve, some through a mistaken idea of getting more land for farming operations. Be it as it may, we have been finding year by year, the country become more and more destitute of shelter, and he who begins to protect his farm now, will certainly, in a few years, find such work the best investment he ever made, whether in view of the better crops to be obtained, the greater comfort in a farm so sheltered,or the additional price to be had if he choose to sell.

It is not as if this was a new, an untried, or a but lately tried method. Letters have been received from nearly three hundred well informed residents in different parts of Ontario, stating that such protection is always, in their experience, beneficial, and often in the case of winter crops, increasing the yield one-half over those obtained close by, but in unsheltered parts of the same or other farms.

The planting of evergreens has not been so general as that of other trees in Ontario, as they have been considered more difficult of growth. This has arisen mainly from one fact connected with their planting, that is, the roots must not be allowed any chance of drying. These trees have a resinous sap, which, once dried, kills the life of the tree. It requires but little exposure to do this. If you bring an evergreen, in apparently good condition, to the place where you want to plant it, and leave it exposed to sun and wind while you dig the hole, even that amount of drying will sometimes destroy its chance of strong life, or of any life. These roots are often hair-like in their size, and wind or sun chokes the tubes at once with solid resin, which no watering will soften or vitalize. Yet they can be, and are, often carried with perfect safety long distances, even round the world, well packed in damp moss. If you so receive them, plant them the instant you take them out of the moss. If you dig them, cover instantly with some cloth or rug, choosing, if possible, a cloudy still day, and keep them closely covered till the time of planting. It is well to dip them in thin mud, as elsewhere advised. With this care there is absolutely no difficulty in planting eve greens. It is being done every day —is done in the States. I am glad to say, by the hundred thousand plants, and failure is rare.

As for the time to plant them, the first week in June is an exellent time—so is the first week in August. Yet they have been and are planted at all seasons, when the ground is workable, and with success. But reason must be observed in planting. For instance, if you go to a deep poor sand for your plants. There they send in their long hair-like roots far down—perhaps three feet—for nourishment. It is hard to transplant this lengthy mass so as not too greatly shock its habit of growth. The moral is, if you go there, take the plants thence very young, before they can have sent out deep roots, transplant them into your garden, and in a couple of years you will have fine stocky plants fit for any purpose. But do not let this discourage you from taking them from any forest. In many localities you will find them —take those near the outskirts always—with excellent roots. I know many beautiful groves of pine in Ontario—many long stretches of wind break now fifty feet in height—the pride of the farms they beautify—which were taken when two or three feet high from the forest without one per cent. of failure. I knew one instance where nearly eight hundred young pines were moved in early spring, one morning after a sharp frost, which had re-frozen the ground, previously thawed, an inch or so deep. These then cut round, brought up circular masses of earth three or four inches thick and eighteen inches wide, containing within plenty of root fibres. This was on loam, not sand, so there was much surface root. Of the 800 scarce half a dozen failed.

A very important matter is the preparation of the ground, and when our plantation is of such narrow proportions as a windbreak this is easily done. A few furrows of the plough in fall and spring, or in spring alone, harrow it properly, and the work is done. This statement is applicable to most farm soils in ordinarily good condition, but where the soil is rather intractable other means may be necessary. We must consider, that it is only one long narrow row of plants we are preparing for. If the soil be a hard, apparently poor red or white clay, it is undoubtedly difficult even with two ploughings to bring about exactly the condition of mellowness which we should desire for the reception of tender roots of young evergreens. They can be planted there, and they will grow and succeed there, but it will take time. There is a quicker method, and when we can, it is well to employ one, for life is short. This hard clay soil is not poor, it is too close and dense. If you have within reasonable distance some sand, whether it be sharp and white, apparently only fit for mortar, or whether it be red and mixed with humus, so that it be but sand. A few waggon loads of this dra n along the proposed line of windbreak, and scattered two inches thick before you plough, would change your hard clay to soil soft enough for tree roots. Two waggon loads will do a hundred yards, or if the land be poor sand, and clay be near white, red, or blue, though it be the hardest and poorest, applied in the same quantities, (break the lumps) it will do as much for the sandy soil, as the sand does for the clay one. But most soils will grow trees without.

There are different methods of rapidly planting these windbreaks. In the case of young plants, one is to run a furrow, two men then pass along, one with a bundle of plants under his arm, the other with a spade. He first places the plant in position, presses and spreads its roots against the upright side of the furrow and holds it there, while the second throws earth against it and presses it firmly and evenly with his foot. Another, still in the case of small plants, is to run no furrow, but set a line, along which, at proper intervals, one throws out a spadeful, the other sets the tree therein and holds it, while the first throws earth against it and presses it firmly. The third is in the case of larger plants. Here, three men are better employed, one in advance digs larger holes along the line, the second places a tree, spreads its roots more horizontally than in the former methods, while the third fills it up and treads it down.

It must be remarked that the time occupied depends on the side of the roots and the state of preparation of the soil. Farmers must judge whether the roots need more or less time to place them at the level they stood in their nursery or forest, and with their roots properly in contact with the soil. Some soils would need much more careful handling than others. But do the work well; it will pay.

The distance at which such evergreen trees should be planted is a matter for consideration. If you take the pines, planting even twenty feet apart would undoubtedly give, after a number of years, an efficient windbreak, for, say in twenty years, their branches would interlace. But by planting closer we may have a windbreak in a much shorter period. If we plant, say three feet apart, we can well, in a few years, take out and plant elsewhere every second tree, and this is preferable to planting them six feet apart at first, for each closely neighboring young tree helps the growth of the other. Where plants are small, it would be better to plant them yet closer, and depend on the future for proper thinning. Then you can indefinitely extend your lines of trees, as you will have a number of well grown plants five or six years old with fine large masses of fibrous roots, which, properly dug and planted, will then give you, in a very short time, as many beautiful rows of sheltering evergreens as your farm shall need, or, if you have more than you will then consider requisite, you can sell them for good prices to such of your neighbors as have been less provident. And there is too good reason to believe that by that time, considering the present process of tree denudation, the value of shelter will have so impressed pressed itself upon the minds of the surrounding farmers that you will have a remunerative market for all you can spare.

With regard to the after treatment of these windbreaks, an evergreen never should be trimmed up, that is to say, it should always be allowed to throw out its branches close to the ground at will. Its lowest branches are naturally the longest when grown in the open, and its tendency there is ever to shade by its lower branches and to much the earth below them by the covering of its fallen needles.

As has been said, the planting of even a very long row of evergreen windbreak is a matter of but slight expense. The young trees can, in many instances, be procured from our forests, or the seed can be sown, the young plants the second year planted out in nursery beds and the fourth in the windbreak, or the seedling can be procured for a few dollars per thousand from nurserymen.

In planting windbreaks of cedar, the best specimens I have seen were planted much more closely than the pines or spruces, being left at two feet or even a less distance apart.

Following this will be found a list of pines, cedars and spruces best calculated for this purpose, their distinctive methods growth, their favorite soil, and their means of propagation and culture. Where these are not fully stated in any instance, all particulars will be found in the list of trees at the end of the book:—

Pinus Resinosa (Red pine).— This tree delights in a dry, sandy, or gravelly soil, or in one formed from the debris of rock. It will, however, and does frequently in our forests, grow in others. I have seen large trees on clay loam. —B.

Pinus Austriaca (Black Austrian pine).—We have not found this tree at all particular in regard to soil, if it is not stiff and wet. The best specimens we have seen of it grew upon a sloping bank, where the soil was a light loam, and deep and porous. We have, however, seen thriving plantations of it on most kinds of land, but there were always made dry by drainage, if not so naturally. It is a tree well adapted to produce a great degree of shelter, as its massy foliage forms a great protection from winds, and its rapid growth insures this within a very short time after planting. This tree is readily known from all other pines introduced into this country by its very strong and robust habit of growth, by the stiffness and strength of the leaves, by their prickly points, and by the very decided dark appearance of the foliage over the whole tree.—B.

Pinus Sylvestris (Scotia pine).— Leaves in pairs, rigid. Cones conico-ovate, acute, as long as the leaves, generally in pairs. We have seen the Scots pine growing on almost every variety of land; but we are of opinion that a light, sandy, or gravelly loam, is, above all others, when perfectly dry, the most appropriate for the tree. As to situation, suffice it to say, that if the land on which the Scots pine is planted be dry, it will prosper in any site not too elevated and exposed for trees to succeed in this country.—B.

Pinus Strobus (White pine).—The white pine will grow rapidly on light, poor, sandy soils, and there are millions of acres of such lands that could not be put to a better purpose than planting it with white pines.—F. The branches are in regular whorls; and in young trees, and where openly exposed, they form a beautiful pyramid; the foliage is pliant, leaves slender, from three to four inches long, of a light bluish green.—W.

Pinus Ponderosa (Heavy wooded pin).—e This tree has leaves from nine inches to a foot long. Branches are regularly whorled, horizontal, and inclined to droop. This tree has a noble appearance, even when young. It is from the northwest coast of America. Hard, and grows rapidly.—W. The soil of this species, as for most others of the pine tribe, should not be of a rich nature, as under such circumstances the pines generally grow too luxuriantly, and consequently do not ripen the points of their shoots sufficiently to resist the frosts of our winter.—B.

Pinus Pinaster, (Cluster pine).—Leaves twin, roughly at edge. Cones oblong, conical,

shorter than leaf, narrow at base; scales echinate.—B. It thrives in deep, sandy land, and is said to perish in calcareous soils. Immense tracts of barren, drifting sand have been covered with this tree in France, which now yield abundant crops of inferior lumber, fuel, and pitch.—W. Propagstion from seed; sow at the end of April; transplant in one and two years.

Pinus Benthamiana (Bentham's Pine).—Leaves three in a sheath, thickly set on the branches, dark green; generally from eight to eleven inches, stout, somewhat flat, with a slightly elevated rib running along their inner side. One of the hardiest, and most ornamental pines. Propagation same as the Scotch pine. Deep, free soil.

Pinus Laricio (Corsican pine).—Leaves two in a sheath, lax, from five to seven inches long, dark green, often twisted, sheaths short. A beautiful tree of a pyramidal and open-branched form. Will grow on most soils. Hardy, but unsuited to high winds. A very rapid grower, making two or three feet a year. Propagation from seed.

Abies excelsa (Norway spruce fir).—Leaves scattered, quadrangular. Cones cylindrical, terminal, pendant, scales naked, truncate at the summit, flat. It flowers in May; its cones are ripened in the spring of the following year, soon after which they commence shedding their seeds One of the best trees for shelter belts, on account of its tendency to spread out its lower branches, assuming naturally the pyramidal form; and it is also found that this plant bears clipping very well. Nothing can be more beautiful or more effective as a shelter than the Norway spruce. The seed is propagated in the same manner as that of the P. Sylvestris, the seeding plants remain two years in the seed bed, but they they generally require three years in the nursery rows before they are fit to be put in their final situations. They grow best in a moist, and moderately rich, but not wet soil.

Abies Canadensis (Hemlock spruce fir)—Grows well, and makes a fine spreading shelter tree on tolerably good soil, but will not succeed as well in the open, on poor hard clay, as it did in the original forest.

Abies Nigra (Black spruce fir)—Will form a rather tall, slender tree, with branches spreading horizontally, and frequently drooping at the ends, in the case of old trees. The stem is generally smooth, with a blackish bark, very straight, and diminishing regularly from the bottom to the top. The whole tree has an open and airy appearance, from light being admitted between the whorls of branches, which are never of a massy or heavy character, like those of the common spruce fir, but light and pointed each tier showing the outline distinctly.—B. Both this tree and the one preceding stand the shears well; but so far as I have seen, they must not be cut down to small hedges of six or eight feet high. They are trees for shelter belts and the effort to treat them as hedge-plants I have known to kill them.

Abies Alba (White spruce fir).—This species is easily distinguished from all the other species of the family by the lighter color of its leaves, which are of a somewhat hoary-grey color; form a beautiful small tree. The proprietor who wishes to produce a rich coloring of foliage in any particular part of his grounds, has only to plant some dark-leaved pine in the background, the sugar-maple in the front of it, and the white spruce in front of the maple; and when these trees have attained some size he will find the autumn colorings admirable — the yellow, red, and crimson of the maple, the very dark green of the pine, and the hoary grey of the white spruce blending so as to produce an effect indiscribable, and beyond the art of the painter.—B.

Thuja Occidentalis, (White cedar).—The trunk tapers gradually from the ground, and the branches are so arranged as to form a pyramidal tree with a broad base; the twigs are drooping, and all the branches have a flattened character. This is justly considered one of the best American evergreens for general planting, on account of its adaptability to general situations. Since its native habitats are peaty swamps, and rocky cliffs, it will thrive in almost any situation; and its conical figure and rather free growth make a good effect. One of the characters that recommend this tree is, that it bears clipping, and hence it is well suited for ornamental hedges, and wind-screens, for which purpose it is generally used.—W.

Juniperus Virginiana (Red cedar).—Red cedar is one of our own most valuable evergreen trees; nothing can exceed its value for purpose of shelter. As an ornamental tree or large shrub it is of great value for grouping. This plant is highly esteemed in Europe, but quite too much neglected in our own country; perhaps because it is so common; its growth is rapid, and it is very hardy. The shelter and food which this cedar affords to the feathered friends of man, are a great recommendation to it, and should induce every planter to plant the tree.—W.

The initials mark quotations from Messrs. Brown, Warder, and Fuller.

A NEW LUMBER MARKET.

The brigantine Georgia, now anchored in the Delaware river, has been chartered to load a cargo of hardware and lumber for Port Madryn, Patagonia, a place heretofore unknown to American custom officials. It is believed that the Georgia will be the first vessel to sail from this country to Port Madryn, as the existence of the place is practically unknown in maritime circles. Capt. Morris, of the Georgia, says that his vessel will sail to-morrow for her destination via Wilmington, N. C., where the greater part of her cargo will be loaded, after which he expects to be not more than seventy-five days in reaching his destination. The offer to carry the cargo was made to several ship owners, who refused even to consider the charter, not being willing to risk their lives and property in an unknown country.

The settlement of Port Madryn has been comparatively recent. Several years ago a colony of farmers from the vicinity of Cardiff, Wales, decided to leave their native land for the river Platte, expecting to settle along that river, but, finding the Spanish language an insurmountable obstacle to them, the people left for Patagonia. This little colony now numbers over seven hundred souls, and their farms stretch inland for a distance of over 23 miles. The settlers are in constant intercourse with the Indians, with whom they barter tobacco and flour for ostrich feathers and guanaco skins. No American vessel of any kind has ever visited there, and but very few ships from other nationalities have made the port. Lieut. C. B. Brent, of the English war ship Volca, which visited the place in 1876, describes the country as healthy, without fog, and very little rain, water being carried from the interior, a distance of twenty miles, on mules. If the settlement continues to flourish, and its existence becomes generally known, it will be a convenient port of call for vessels bound around the Horn.—*Philadelphia Record.*

WHY SUFFER from that annoying cough when it can be perfectly cured with West's Cough Syrup. Do not hesitate, as it is exceedingly dangerous, as it may prove the forerunner of a severe lung complaint. It will cure asthma, bronchitis and all throat and lung complaints. Price 25c., 50c. and $1.00 per bottle. Sold by J. D. TULLY, druggist.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

THE
Gutta Percha & Rubber Mfg. Co'y

Market Reports.

TORONTO.

From Our Own Correspondent.

AUG. 9.—The new cut of lumber is now coming in by rail freely, so much so indeed that the railroad companies are taxed to their utmost to supply cars to meet the demand, box cars are therefore loaded as freely as flats. The north shore of Georgian Bay is supplying a large portion of that now arriving here. This has not been the case hitherto, most of that cut having found its way to Chicago and other American ports. The Pacific Junction branch railway is also contributing its quota now that the entire line is opened for traffic. The lumber most difficult to procure at present is long bill stuff cut to order, and work on hand is frequently brought to a full stop pending the arrival of long joisting. The new tariff of freights is now in full swing, and although lumber brought in under that tariff costs more to the middlemen than under the old rates prices cannot be said to have advanced as yet, but it is quite clear it must do so or some one will come out behind.

The yards are doing a thriving trade so far as the quantity sold is concerned; prices are sadly cut, however, and fault rests entirely with themselves. The same men pay their butcher and baker a uniform price for all they purchase from them, simply because said butchers and bakers have determined among themselves that such shall be the case, but the retail lumbermen are cutting each others throats, metaphorically speaking, year after year, thereby only making the same profits on 2 000 feet of lumber that should be made on 1,000 feet—I can only add, serves them right.

Shipping from our docks moves slowly, the only firm doing anything worth mentioning over the docks is Christie Kerr & Co., who control much the larger portion of the lumber north of this city.

I anticipated being able to give you a change for the better on yard quotations, but after diligent inquiries I fail to find as yet any material change although all are free to admit that prices should go up in view of the figures asked by the wholesale men. I am sanguine that by the time my next letter is due yard men will have seen their way clear to making a general advance in prices all along the line.

MONTREAL.

From Our Own Correspondent.

AUG. 10.—Since our last report the lumber trade in Montreal has continued in a very satisfactory condition. Favorable weather, and an increased activity in building operations in the city has given a still further impetus to trade. The retail demand at the yard has been very good, and country orders, which have been coming in freely, have resulted in an increased distribution from the yards. Everything points to a continuance of the present activity for some time, as the outlook in the building line is still bright. A large increase can be noted in the July sales, over those of June, and also over those of the corresponding month of last year. A fair amount of stock of all kinds is held at present. Freight rates on lumber are quoted as follows:—To the United Kingdom 47s. 6d. to 50s. per standard, and to South America $11 00 to $12 per M. The export trade is brisk, and to date includes 1.294,896 pieces of deals, ends, boards and battens, and 276,087 feet of other lumber to Europe, and 293,793 pieces, containing 4,964,321 feet to South America.

Prices remain steady.

CHICAGO.

The *Northwestern Lumberman* of Aug. 7th says:—

BY THE CARGO.

Of the more than 200 cargoes that have entered port, but a few have stopped at the market docks. The meagerness of offerings has caused cargoes as were for sale to be sold without delay. Buyers have hung about the market to obtain cargoes that did not put in an appearance. Perhaps the commission men are withholding bait until the fish get hungry. The trouble seems to be, however, that most of the lumber now going into yard stocks has been bought at the mills. It is coming forward in large volume, as the port list daily shows, and no thanks to the cargo market. It is a common remark about the foot of Franklyn street that "this market is about played out." But the *Lumberman* regards this judgment as premature One reason why lumber is not coming to market as in former season's is because the yard men have been forced to go to the mills in order to pick up bargains. They say that in this way only can they lay in stocks that will secure them a margin in selling. The cargo market is not sufficiently well supplied with the different classes of lumber. This may change in future seasons. Conditions may be reversed. Over-production or a falling off in the eastern demand may cause a pressure of lumber on the western trade. Then the commission men will again be in clover. But this season they are having plenty of time to reflect on the past and prognosticate about the future.

There has hardly been sufficient movement this week to make a clearly defined market. Prices are held firmly because there is no pressure of lumber for sale. It is claimed that short piece stuff can be sold readily at $9.25, but it cannot be learned that more than one cargo has this week been disposed of at this figure, though the cargo referred to was all Norway. It is claimed that more of the same sort would sell at the same figure. The range at $9 to $9.25 for short green piece stuff need not be modified.

The market for inch lumber is unchanged. There is little being offered. Medium boards and strips have been sold within a few days at $13 and $13.50. No. 2 stock goes on prices within our quoted range.

Shingles are still to be had in excess of yard requirements, though the standard brands are said to be doing a little better than earlier in the season, and firm at the slight advance recently recorded.

The following are current quotations of cargo prices:—

AT THE YARDS.

There has been a plainly noticeable increase of activity during the week. More lumber than formerly is going into cars. The waggon trade is greater than it was a week ago. Inquiries from the country are more frequent than they were a short time ago. This last-named feature has become pronounced, and marks the initiation of August trade. Inquiry from outside yard dealers comes every year about August 1st, as regularly as the seasons pass. In every instance in which a lively demand succeds a dull period, the actual revival of trade is preceded by general inquiry as to stocks and prices. This season the inquiry will be more urgent than it sometimes is, on account of the late rise of price for piece stuff on the cargo market, and low stage of the log driving streams,—circumstances that go to show that there may be a sharp advance in the price of yard stocks in the near future.

TYNE.

The *Timber Trades Jonrnal* of July 31st says:—There is a fairly good list of arrivals to report this week; large lines of them are pit-props and mining timber a few cargoes of staves and headings, one cargo of prepared boards from Drammen one cargo of pitch pine timber and deals from Pensacola, and remainder are made up principally from the Baltic ports. The weather has been finer and more suitable for outdoor operations; but in spite of all the favorable circumstances business does not improve. The demand is as feeble as ever, and no prospect of it improving in the immediate future. Saw mills are only partially employed; in the building trade it is only in the suburbs of Newcastle that any building is going forforward and that to a very small extent Of contracting there never was less being done than at the present moment, no large jobs being in progress. Freights still remain low but the bulk of the ships wanted appear now to be fixed.

GLASGOW

The *Timber Trades Journal* of July 31st says:—Business here has been quite during the past week On Monday the shipyards, &c., opened for the first time after the holidays, but it was not till the middle of the week that the yard resumed its ordinary working condition, and meantime transaction in the wood trade have been small.

No auction sales of timber or deals have been held at Clyde ports since last writing. There is one to take place at Greenock this week, the result of which will be given next issue.

The arrivals at Greenock for the past week include four cargoes of Quebec timber and a cargo of pitch pine; and the principal imports at Glasgow to note are a cargo of mahogany, parcels of Quebec deals per steam liners, and a cargo of Bathurst, N. B., pine deals now discharging at Yorkhill Wharf, and which is going into consumers' hands direct.

The Canadian deals landed at Glasgow ex steamer since the season began amount now to 90,000 pieces, as against 111,000 for the corresponding period last year; but taking into account the Quebec deals landed at Greenock ex sailing vessels, they make altogether about the same total imported this year as last up to date say 143,000 pieces this year, as against 135,000 pieces in 1885, same period. The sailing ships from Quebec to Greenock commenced to arrive earlier this year, the date of the first being 23rd June, or fully a fortnight sooner than last year and since the arrivals began the carrying tonnage amounts to 12,500 tons; last year at this date the total was 6,600 tons. The timber in log imported from Quebec to Clyde since season began amounts to 1,571 logs oak, 112 logs elm, 88 logs ash. 10,300 logs pine timber.

The stock of red pine timber is unusually low, but there is little demand; except first-class of large average, which is in fair request.

CARDIFF.

The *Timber Trades Jonrnal* of July 31st says:—During the week we have had in one cargo of boards from Drammen, two of timber

from Quebec, one of deals from Miramichi, a small steamer cargo of wood pulp from Drammen, and a cargo of deals from Archangel.

As regards the state of the market, we may quote a remark made by one of our leading merchants, that "it's better to do nothing than work for nothing," implying that whatever is done is without remuneration, and the question now is, whether it is best to continue the business for the sake of the connections or to stand off until things improve.

We have heard figures mentioned for Midland delivery for spruce deals which we fear to quote, as they are so low that it is a mystery how any one can do them and make both ends meet. Importers are all holding off in expectation of consignment cargoes being thrown on the market later on, which would be sure to go below the present prices.

With regard to mining timber, there is not by a long way the usual quantity of offering in the market, still there is no prospect of improvement.

LIVERPOOL.

The *Timber Trades Journal* of July 31st says:—The first vessels with cargoes of timber from Quebec are now getting well on with their discharge; but we regret to see very little of either waney board pine or oak going into consumption. This is widely different from what was the usual case in former years, when considerable lines of both these descriptions of wood were generally forwarded up the country to the large railway companies, machinists, or waggon-builders. At present, however, none of this class of consumers appear to be in the market; the great machinists probably from want of work in their department, owing to the depressed condition of the cotton industry, and the great railway companies because they are desirous to limit their expenditure upon rolling stock as far as is prudent.

The financial collapse of the Manchester Ship Canal project will, no doubt, have a depressing effect on business in this district, as a great number of people were looking forward to the commencement of the works with considerable interest, and the grievous disappointment which has so rapidly followed the bright hopes which were held out by the promoters of the cheme, whereby the resuscitation of trade in he neighborhood was to be effected, will cast a damp on all those immediately concerned, as well as upon others indirectly interested.

Our market is still in the same depressed condition as ever, nor do we see any immediate prospect of improvement, prices, if there be any change, are still in favor of the buyer in nearly every instance, and the general feeling here is that those who are doing the least business are perhaps to best off in the end.

No public sales of whitewoods are announced nor can we learn of any in contemplation, the unsatisfactory results of the last auctions having driven the brokers to dispose of their consignment cargoes by private treaty in preference to selling them in public.

This will not matter much to the cansumer in the long run, for he will be well looked after by the merchants' travellers, and the competition is so keen that an order will not refused if there is anything in it, however small it may be, so that he will probably do as well without leaving home as he would do here by attending personally, and will save travelling expenses at any rate.

LONDON.

The *Timber Trades Journal* of July 31st says:—At present, from what we gather, £10 to £10 5s. is the current quotation for 3rd Quebec regulars ex ship, and that the price has not been an obstacle to sales seems evident by their being so few deals remaining in first hands. A leading Quebec house recently told us that they had fewer pine deals of any kind in the docks at the present time than at any time previously.

We had some slight expectations that the improvement noticeable in last week's reported London dock deliveries over those of 1885 would have been maintained for the remaining portion of the season, but it appears that the depressed condition of things then apparent is to reappear in an aggravated form the present year. We are already short of the consumption of last year some 12,000 standards on deals and battens, and 2,000 standards on flooring. The cause of this was principally laid at the door of the stimulus imparted a twelvemonth ago by what was known as the Russian war scare, but this has been insupporable by subsequent records, and we must set down the lessened consumption to the true cause, viz., an utter stagnation in trade, and though last year was essentially a bad one the present is a great deal worse. That free-on-board prices have kept their tone is probably due to the discretion of those who had the controlling power avoiding sending cargoes on the market.

The arrivals recorded this week to the Thames are 56, against 63 that had come forward in the corresponding interval twelvemonths ago. Last year the week's list to the Surrey Docks did not include a single pine cargo, this time they are credited with a pine and a spruce cargo, both for Messrs. Price & Pierce. The Millwall docks have 14 cargoes this week, against seven at a corresponding date 1885. Of these two are pine, viz., the Victory, from Quebec, with 320 standards of 3rd and 4th pine, for Messrs. Browning & Co., and the Fernholme, from Montreal, with about 700 standards, for Messrs. Bryant, Powis & Bryant, Limited. We notice that the Regent's Canal dock is the recipient of of a cargo of pine deals per the Oscar.

Freights continue depressed, and we note Quebec and London has just been done at 42s. 6d., the lowest charters we have heard of from this port for a sailing ship; but we understand it cannot be repeated. Tonnage is offering on this side to go out with the hope of finding charterers. In respect to the lower ports we learn that tonnage from New Brunswick and Nova Scotia is only placeable with difficulty, most of the charters being filled up. We understand some of the Pensacola charters are holding off, and are not tempted to fix even at 87s. 6d. and 85s. for sawn stuff. Tonnage, generally, is declining with very little prospect of improvement, and the action of shipowners in withdrawing their vessels has not had the result we hoped it would, and though ships continue to be taken out of the market there are, unfortunately for owners plenty of other to take their place. We furthermore learn that one of the large Pensacola shippers contemplates opening his mills much earlier than usual prices being so unprofitable; this certainly won't help freights.

There was a capital muster of the trade at Messrs Churchill & Sims sale on Wednesday, the back benches being well occupied.

There was some spirit in the bidding for the whitewood. The St. John spruce planks ex Avoca, however, went remarkably cheap, at an almost uniform price of £6 5s, buyers making no distinction between the 11 and 9 in., though a few of the lots of the latter fell at £6 The 3rds Quebec, per the Craigallion, also planks, went at similar values; here again the 9 inch were valued as the planks. The Riga crown white 3x11 seemed stationary at £6 15s., and it was almost a feature of this sale how prices held such uniformity, which may be accepted as pretty plain evidence of the close competition maintained by merchants when re selling. The parcel per Mathilde Joost, with no exception, went at precisely similar prices to the other Riga goods. The exception we refer to was lot 282, which was carried by the competition another 10s., the buyer, a leading merchant, getting this solitary lot for £7 5s., against the £6 15s. at which his neighbors secured their portions. This was the only lot of crown having 22 fts., and that may be the solution of the mystery.

The ash planks and boards per the Durham City seemed to be at a discount. A leading pine buyer came to the rescue, and appropriated them at 1s. 2d. a foot cube, otherwise it is doubtful what would have been their fate.

There was only a few odd parcels of Quebec pine offered, and prices would not be a sufficient index to the market if we particularized them.

SHERIFF MCQUARRIE, of Rat Portage, reports that things are looking up in that district; the Rainy River Lumber Co.'s mill has started and the saw mill is being got ready for work.

LATH MANUFACTURE.

We learn from a Saginaw paper that there are about forty saw mills on the Saginaw river, Michigan, in which lath mills are operated the production running from 300,000 to 4,000,000 lath each, and that the manufacture of lath is almost as unsatisfactory as that of shingles, as regards prices. "It is true there has been a fair demand, and shipments exceed those of last year up to this time, but there are not going to be any fortunes made this year at $1 15, and sales have been made at that figure, though the quotations run all the way up to $1.40, though $1.25 is about the average asking price. The lath product of the Saginaw river mill during a series of years shows:—

	Product.
1876	72,702,660 pcs.
1877	72,514,999 "
1878	53,236,075 "
1879	65,969,000 "
1880	65,663,883 "
1881	65,983,750 "
1882	94,703,800 "
1883	106,132,490 "
1884	127,346,000 "
1885	80,931,400 "

The aggregate capacity of the mills has been reduced about 10,000,000 pieces by the destruction of mills. So that the out-turn for the year 1885 is scarcely over the average of the past ten years. The largest output of any one concern was that of a Bay City firm, Birdsall & Barker, who manufactured four millions and a quarter of pieces.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. patent office, July 27, 1886, is specially reported by Franklin H. Hough, solicitor of American and foreign patents, 925 F street, N. W. Washington, D. C., who will furnish copies of patents for 25 cents each.

346,133— Chuck, lathe—C. A. Singer, New York N. Y.

346,164—Lathe—J. Judson, Rochester, N. Y.

346,324—Lathes, steady rest for—J. Seibert, St. Louis, Mo.

JAMES PATTON,
Supervisor of Cullers.

Quebec, 16th July, 1886.

THE forest fires in Marathon and Clar counties, Wisconsin, communicated to the towns of Spencer and Colby, laying the former in ashes and considerably destroying the latter.

MECHANICAL EXPANSION.

Every way has been studied out, and carefully tested, to make an arbor or a mandrel a little larger in diameter, and the screw tap and expansion reamer have been very successful in this respect, and if the same features could be applied to the driving pulley of a machine it would make one of the best means for making a variation in speed. It has been applied to the cross-head pin made to expand by internal wedge-key work, that will take up for wear at this end of the connecting rod, but the cross head pin only needs a small portion of an arc on opposite sides to be provided for. Something of this kind may yet be applied to the crank pin, as it is said that this portion of an over-hang crank is likely to get out of round and pinch in the boxes if keyed up to take out all the thump and pound. When a plug tap and a fluted reamer is made so as to be expanded, they must be handled with care, as the most of them, when in one solid piece, are none too strong for the average workman, yet they are handy tools, and the reamer needs grinding on centres to keep it anywhere near accuracy. If the expanding mandrel was not subject to such a heavy duty it would be just the thing around a repair shop to handle the different gear wheels that must be provided for; then a wheel blank could be bored out at once just the exact size and held on centres without turning down an arbor for the occasion. A slight degree of enlargement is all that is required to meet the demand of a number of sizes that are used. One trouble has been to make one size do all the work, making a very compact device for a small bore, and a very inaccurate machine for heavy work. It is much better in providing for the enlargement of every appliance to expand a little, and do it well, than to be spreading all out of semblance with no dependence to be placed on anything. If an expansion shaft pulley were to receive some such attention it would be received with welcome, as as it would put an end to soft-wood lagging, and the demand for old belting to test some of the recipes for cementing leather to cast-iron pulleys, or the paper mache arrangement for winding on a lagging in a moment.—*Boston Journal of Commerce.*

FOREST FIRES.

Science has recondite theories to account for very common things. Some of these theories seem to the unscientific to be absurd, but others cannot be disregarded. Here is something from a druggist in Maine, with regard to forest fires: "It is reasonable to assume that many fires originating in the woods are not caused intentionly by boys, gunners, &c, but by natural cases and the sun. It is a fact that most of our forest fires occur when the resin or gum is exuding in the warm season and in forests composed chiefly of soft woods of resinous trees—the pine spruce, hacmatack and hemlock. It is often observed that these species of tree exude a resin that in losing its volatile element, hardens and for a short time before becoming opaque makes a very good magnifying lens, and powerful enough to set fire to very dry punky materials. Admitting these conditions, then to start a forest fire in the dry season among resinous woods, we require the sun shining on one of those natural sun glasses, and back of it in the focus some suitable material, as dead bark, wood, or best of all, that dead, dry, mealy condition of soft woods caused by insects." One can hardly deny Dr. Roche's statement of these conditions; the resinous forest, the dead bark, the "punky" and susceptible wood. But the lens made of resin is something new to the non-scientific woodman and indeed to the non-scientific reader. However, when one reads in the *Chronicle* the doctor's account of the fire set in his window by the rays of the sun passing through a show bottle filled with colored alcohol, he is impressed with the notion that there are a good many agencies contributing to the annual fire-waste. There is this to be said, however, that if this theory of the origin of forest fires be correct, "what we are going to do about it" is not easily seen. It seems as if the forces of nature with her myriads of burning glasses in the depth of the forest, were too much for any efforts of man.—*Monetary Times.*

HUGH GIBSON,

MANUFACTURER OF

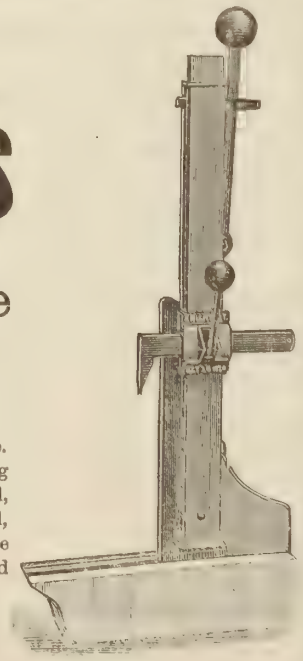
KNIGHT'S PATENT "EXCELLSIOR"

SAW MILL DOGS

The Sawyer's Favorite

For Holding Logs upon a Saw Mill Carriage while being Sawn into Lumber.

These Milldogs I guarantee to give satisfaction in every case. They will hold a frozen log as well as a soft one, for cutting Scantling, Square Timber, &c. These Dogs cannot be excelled, I sell them all on their own merits, give ten or fifteen days trial, and then, if not satisfactory, return them to my order, as I have no agents on the road this year, I will sell them at a reduced price. Send for Circular and price list.



EXCELSIOR DOG.

Manufactured by HUGH GIBSON, CHATHAM.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

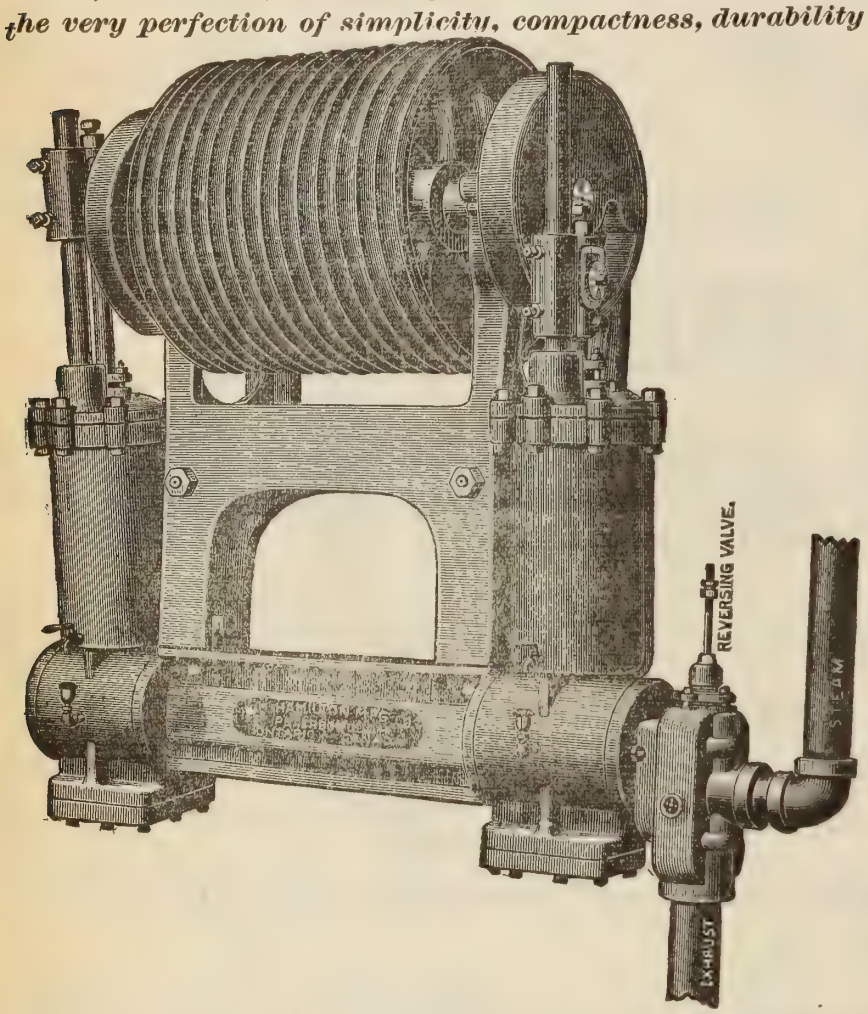
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATNG TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROP.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoud ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfa_ & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw Mill for cutting logs

☞ ***We guarantee this to be the best Mill of his kind got up, and would ask any one wanting a good Band Saw Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacurers,***

PUBLISHED SEMI-MONTHLY. | PETERBOROUGH, ONT., SEPTEMBER 15, 1886. | SUBSCRIPTION $2.00 PER ANNUM.

ANNOUNCEMENT.

We have to announce to our subscribers that we have transferred our interest in the Canada Lumberman to Mr. A. G. Mortimer, who will assume control of it after this number, which will be our last.

We can confidently recommend our successor, Mr. Mortimer, to the friends of the Canada Lumberman, and to all interested in the timber trades and allied industries of the Dominion. His connection for several years with the *Mechanical and Milling News* guarantees his fitness to conduct this journal and especially qualifies him for so doing. We can, therefore, ask for him a continuance of that support and patronage, for which, in speaking these words of farewell, we beg to tender our sincere thanks.

The Peterborough Review Printing and Publishing Co. (Limited.)

In connection with the above announcement concerning the change of proprietorship of the Canada Lumberman, we simply desire for the time being to acknowledge with thanks the kindly introduction given us by our predecessors. The first issue under the new management will contain our salutatory, from which the many readers of this paper will be able to form an idea at least of the various new features we intend to introduce. In this connection, however, it becomes necessary to state that the Lumberman will hereafter be issued on the first day of every month, and the subscription price, which in the past has been two dollars per annum, has now been reduced to one-half that amount. We shall be pleased to send sample copies of any issue on application.

Respectfully, &c.,

A. G. Mortmer.

TORONTO.

From Our Own Correspondent.

Our local market is fully supplied with most kinds of lumber, in fact some lines are in excess of the demands, although it is safe to say that in no other city on this continent, no matter what its size may be, can boast of a brisker building trade than our fair city can at the present time. New buildings in the course of erection may be counted, not by the dozen merely, but by the hundred, and it is in just such busy times as the present that bad debts are likely to be made, and much care is needed on the part of dealers. The larger the flock, the more black sheep there are likely to be there. Some speculative builders have already cleared out between the two lights this season, leaving numerous creditors to morn over their ill placed confidence. If care is only exercised by dealers there is no reason to fear but that the season's trade will be good one throughout. Competition is keen however. The large amount of lumber being disposed of in our market has stimulated the growth of lumbermen like mushrooms, so that our city is industriously drummed from one end to the other by young men really having no knowledge of the business, but anxious to turn an honest dollar. The legitimate dealers with capital employed in the business, with teams and men to keep, taxes and other expenses to meet, find it hard to cope with this class of men, and so their profits are kept down to a small margin.

Business is also badly disorganized by the tariff of freights now in force. It was claimed by the men who inaugurated this scheme that lumbermen would know exactly how much ther lumber would cost them laid down here Instead of this being the case they are further at sea than ever. Previously they could make some approximate calculations as to cost, now they are never sure There is a jumbled up mixture of several tariffs applied by the railway companies, depending entirely upon the weight the loadof carried, and the capacity of the car on which the load is placed. The scheme was a failure from the beginning, and bound as it is with so much red tape, it is fast developing into a farce, and a costly one to the lumbermen at that. It is questionable if any two agents on any part of the railroad lines can be found who take the same meaning from the circulars issued by the freight agents for their guidance. and if they could be got into that delightful condition it would then require a justice of the peace at every shipping point, with bible in hand, to swear the man making the declaration as to quantity, and then it would not be done, as nine-tenths of those who do the loading and shipping of cars know little and care less as to the quantity loaded, and in numerous cases the car is well under way towards its destination before the exact quantity on the car is determined. There is one consolation however, like all such crude schemes it will die a natural death ; the sooner the better.

There is considerable lumber going over the docks, but not up to that of former years. Our local trade will show a large increase by the close of the year and our shipments a decided falling off.

Prices at the yards have not advanced as yet. Middlemen are keeping figures down below what it should be in view of the increased freight rates. Bill stuff cannot be sold at a profit for less than $12 per M for 16 feet and under ; yet it can be bought at $11.50 f.o.b. cars here.

MONTREAL.

From Our Own Correspongent.

Aug. 26 —Trade generally in Montreal continues brisk. the lumber business proving no exception. Many of our lumber merchants say that the volume of business done to date this year is in excess of the corresponding period of last year by from 20 to 30 per cent. The large shipments to date is also a noticeable feature, embracing as they do upwards of 1,500,000 pcs. deals, deal ends, boards and battens, and over 22,000 pcs. of other lumber to Europe, and about 500,000 pcs. lumber to South America. An active demand for the time of year is noticed at the yards, and a large business is being done in car loads, and in retail lots, and some large lines have changed hands.

Advices from the country indicate that a large amount of building is being carried on in the rural districts as well as in the city.

Prices remain steady and are well maintained. Freights on lumber are quoted as follows : To the United Kingdom, 47s. 6d. to 50s. per standard, and to South America, $11.00 to $12 per M.

The following are the quotations at the yards :—

VOL. 6. PETERBOROUGH, ONT., OCTOBER, 1886. NO. 19.

LUMBERING ON THE MIRAMICHI.

A description of the operations in progress or in contemplation at the lumber mills of the Miramichi is given by a travelling correspondent of the Saint John *Sun*, writing from Newcastle, N. B. It is therein stated that a considerable quantity of lumber is being held at Miramichi ports for higher prices. And the quantity shipped to Europe this season will not, it is believed, exceed seventy million feet. That this is a limited export compared with recent seasons will be seen when we give the quantities shipped to Europe in the previous four years:—

1882 shipments.	117,000,000	feet.
1883 do	149 000 000	"
1884 do	108,000,000	"
1885 do	87.000 000	"
1886 (probable) shipments.....	70,000,000	"

A corresponding decrease is shown in the number of feet rafted at the South West boom during those years, vix.: 77,740,000 feet in 1882; 71,194,000 feet in 1883; 37,049,000 feet in 1884; 37,282,000 feet in 1885, and 30,806,000 feet in 1886.

Charters have ranged from 40 to 45 shillings per standard this year. No steamers have been engaged this season. Snowball's deals have been shipped up to date in four sailing vessels. Most of the deals forwarded have been to ports in France and on the Mediterranean. Nearly all those cut by Richards & Hickson at Newcastle, are piled up on their wharf, and Burchill, of Nelson, has only shipped two cargoes this summer, your correspondent was informed. Scarcely any move has been made by operators as to next winter's work, and those spoken to seemed to be greatly discouraged over the continued depression in the European market, and the prospect of no decrease in the government stumpage tax. No doubt Northumberland operators, for reasons which have been pretty fully ventilated in the press, are more seriously affected by high stumpage than their confreres in the south and west. A few cargoes of laths have been shipped to New England this season by the N. B., Trading Co.

Information obtained as to what is being done, or is likely to be done, at individual mills on the river is thus given. We condense the report: J. B. Snowball's two gang steam mill at Chatham, the capacity of which is 175,000 feet per day, is expected to cut twenty million feet this season, which is equal to about 114 days running at full speed. His water mill at Redbank will cut two millions. The double-gang mill at Black Brook, of the New Brunswick Trading Co., on the other hand, expects to cut only eight million feet, which represents but sixty-four days' exertion of its capacity of 125,000 feet daily. D. & J. Richey's mill at Newcastle, equal to over 100,000 feet per day, is expected to cut ten to twelve millions. E. Hutchinson's single gang mill at Douglastown, daily capacity about 50,000, will saw from five to six million. George McLeod's single gang mill at Rosebank, capacity from 35,000 to 40,000, will turn out between five and six million. About six million will be disposed of by the Richards & Hickson single gang mill at Newcastle. Charles Sargeant, at Nelson, has a single gang mill and will take care of about six million feet. This mill is sawing for George McLeod. George Burchill & Son's single gang mill has about eight million feet to saw. John Flitt's mill, not running heretofore, started this week and will cut two or three millions for Wm. Richards. Double gang mill, capacity 80,000. At Blackville is the water mill (single gang), owned by Scott Fairley, will cut about three million this season. Sinclair's steam rotary mill at the Northwest bridge will cut about two million feet.

Now as to the mills which are shut down. The Loggie mill at Chatham, (rotary), now owned by the N. B. Trading Company; Alex. Morrison's double gang mill at Chatham, and the Park mill at Nelson, owned by D. J. Richey, have been idle all summer. And R. P. Whitney's single gang water mill on the North-west is not running this season.

According to these figures the total output of the Miramichi mills this year will be about 80 million feet.

THE LUMBER TRADE OF THE CANADIAN NORTHWEST.

A Bay City, Mich., correspondent asks for information respecting the lumber supply tributary to Winnipeg, Man., and concerning Port Arthur, Ont , as a manufacturing and shipping point. The home forest supply of Manitoba is mainly found on the shores of Lake Winnipeg. Spruce is the principal lumber producing timber. There is a fine growth of spruce on Fisher river, and other streams that run into the eastern shore of Lake Winnipeg. In fact the principal forests of spruce are on the east shore of that lake. The growth is described as rather small, but smooth, straight, and free from coarse knots. Little pine abounds on Lake Winnipeg, but there is plenty of tamarack and poplar. Much of the country along the lake shores, especially on the west side, are low and marshy, a region which is the special habitat of tamarack and poplar. The mill business of the Lake Winnipeg district is centralized at Selkirk, a town at the southern end of the lake, at the mouth of the Red river of the north. It is the lake port of the city of Winnipeg. The Northwest Lumber Company has a mill of large capacity at that point, and handles the greater portion of the logs and lumber that come from the shores of Lake Winnipeg. Distribution of sawed product is, of course, throughout Manitoba and the other northwestern districts. Selkirk has rail communication with the city of Winnipeg, and hence with the railway systems of Manitoba and the northwest territories. It is admirably situated for a large lumber trade, and can command all that Lake Winnipeg can afford. The body of water is remarkably quiet, and log rafting is much less dangerous than on the great lakes of the border But the forest supply being limited mostly to spruce, it is not likely that the Winnipeg lumber business will ever assume vast proportions. Still, knowledge of the forest resources of the district is yet astonishingly limited, even among Canadians, and hereafter there may be developments that shall cause a lumber point to grow up at the southern end of the lake that will rank with the larger centers in the great lake region or the lower provinces. The growth of Manitoba lumber production will be gauged by the growth of population in the tributary country. Without question the Canadian northwest is destined to be a field that will one day require a vast yearly distribution of lumber. When Canadian progress reaches the stage indicated, the timber resources of Lake Winnipeg will be powerfully drawn upon.

If our Bay City correspondent contemplates lumber operations on the north shore of Lake Superior, as his letter indicates, he must expect to meet not only competition from Lake Winnipeg lumberman, but from the Lake of the Woods region, and, to some extent, from the American side. There will also be competition from the Bow river district, in Alberta, near the Rocky mountains, and eventually from Saskatchewan river. But the resources of these last named localities are limited, and will undoubtedly be no more than sufficient for the immediate territory. If our correspondent has a quantity of pine on the north shore of Lake Superior there can be little or no risk in manufacturing and distributing it westward from Port Arthur. Logs can be rafted from shore points to Port Arthur, and the sawed product shipped thence over the Canadian Pacific to Manitoba and beyond. Such a scheme looks perfectly feasible. Mr. Geo. A Priest, and Mr. Alonzo W. Spoor, both of Port Arthur, are gentlemen well informed in regard to Port Arthur lumber interests, and would, no doubt, answer any inquiries that might be addressed to them. The *Lumberman* would also be pleased to have their views on the matters here but hinted at.—*Northwestern Lumberman.*

THE "Lumber Exchange" agitation in New York is becoming a lively question among lumbermen and the lumber press. The opinion is expressed on one hand that such an institution is not required, while some of the largest dealers think it would prove of immense advantage to the trade in general. What the outcome will be time will have to prove.

CANADIAN TIMBER.

It has been estimated by Mr. Ward, an accredited authority on the subject, that Ontario furnishes 4 474 000 pieces equal to 3,600,000 standard pine logs of 200 feet each, producing 520,000,000 feet of lumber; 6,790,090 cubic feet of white and red pine, or 81.000.000 feet b. m.; dimension timber, 23.000,000 feet b. m.; hardwood, cedar &c., equal to 5,000,000 feet—making in the aggregate 635 500 000 feet b. m.; playing to the provincial government for timber dues $501 000, and ground rents $46,000. with 28,000 sqr. miles under license. The province of Quebec has under license 48,500 square miles, producing 2 400 000 square pine logs, equal to 386,000,000 feet b m , and 1,308,000 spruce logs, producing 106,000,000 feet b. m.; white and red pine timber, 3.110,000 cubic feet,equal to 37,320,000 feet b m.; hardwood 51,000 cubic feet, or 611,000 feet b. m ; railroad ties 143,000 pieces 32 feet each, making 4.576,000 feet b. m ; tamarac, 175,000 feet b. m.; hemlock 34,000 feet; cordwood equal to 5,000,000 feet making in all 549,976,000 feet giving a gross revenue of $668,596. Nova Scotia has very prolific forests, but the axe and fire have proved singularly destructive. The rough products of the forest at nearly 200,000. The province of New Brunswick has large "limits" spreading over portions of the counties of Restigouche, Gloucester, Madawaka, Northumberland, Victoria, Carleton, York, Sunbury, Kent, Westmoreland and Queen's. It is stated on the authority of Mr. Ward, that the "cut on government lands in New Brunswick is equal to 160,000,000 feet of all classes, principally spruce; the pine in this province, once so famed, is almost exhausted. There being a large extent of private lands in this province it is safe to estimate that there is not less than 500,000,000 feet of lumber and timber produced, considerably more than three-foruths of which is exported, balance being for home use. The extent of territory is 17,500,000 acres, 10,000,000 of which is granted and located, leaving seven and one-half millions still vacant, and giving to the province $152,000 for timber dues, ground rent, and so forth."

MAKE YOURSELF USEFUL.

A man who regards work as a hardship, an oppression, who look upon the time given to his employer as a species of limited slavery, can never do anything well. He must take an interest in this work if he would excel. The true rule for a young man is to make himself as useful as possible to his employer. He should never feel satisfied with himself as long as anything in his power to promote his employer's interest is left undone. In this way his labor is rendered profitable. Promotion comes unsought and before it is expected. Here lies the secret of success.—*Ex.*

TREES ON THE PACIFIC SLOPE.

George H. Hamm, the well-known correspondent, who is "doing" British Columbia in the interests of the Winnipeg *Manitoban* writes as follows :—"The timber supply of the province is apparently inexhaustible, and will doubtless prove a mine of wealth before many years. Already shipments are made to the Australian, South American and Chinese markets, but the volume of trade has not as yet reached the proportion that it is capable of. The principal tree is the Douglas fir, which ranges from four to twelve feet in diameter, and from two hundred to three hundred feet high. It is straight and tough, and capable of bearing a great strain and is almost unequalled for bridging, framework and for shipbuilding, while its great length and straightness make it especially adapted for masts and spars. Besides the Douglas, the following trees are to be found in the province—the list being obtained from a work issued by the local government. Western hemlock, large, found on coast and Columbia river; Englemann's spruce, eastern part of province and interior plateau; Menzie's spruce, very large mostly on coast; great silver fir, coast tree of great size; balsam spruce, abounds in Gold and Selkirk ranges, and east of McLeod's lake; Williamson's Alpine hemlock, too scarce and too high up to be of much use; red pine (yellow pine or pitch pine,) a variety of the heavy yellow pine of California andOregon, very handsome, four feet diameter, common in drier parts of interior; white pine (mountain pine,) Columbia region—Shuswap and Adarms' lakes — also interior of Vancouver island; white-barked pine, small; western cedar (giant cedar or red cedar,) wood pale, yellow or reddish color, very durable, often found 100 to 150 feet high, and 15 feet thick; yellow cypress (yellow cedar) mainland coast, Vancouver and Queen Charlotte island; western larch, (tamarac,) Rocky Mountains, Selkirk and Gold ranges, west to Shusway lake, large tree, yield a strong, coarse, durable wood; maple, valuable hardwood, on Vancouver and adjacent islands, Queen Charlotte island and the mainland coast, up to 55 deg., attains a diameter of four feet; vine maple, very strong, tough whitewood, confined to coast; yew, Vancouver and opposite mainland shores, very tough and hard, and of a beautiful rose color; crab apple, along all the coasts, wood very hard, takes good polish, and withstands great wear; alder, two feet thick, on the Lower Fraser and along coast, good furniture wood; western birch (paper or canoe birch,) Columbia region, Upper Fraser, Peace river, range and value not mueh known; oak, on Vancouver island 70 feet in height, and three feet in diameter; dogwood, Vancouver and coast opposite. Arbutus, close-grained, heavy, resembling box; reaches 50 feet in height and 20 inches in diameter, found on Vancouver and neighboring islands. Aspen poplar, abounds over the whole interior, reaching a thickness of two feet. Three other varieties of popular are found, commonly included under the name cottonwood. One does not extend above Yale, and is the same wood largely used in Puget Sound to make staves for sugar barrels for San Francisco. The other two kinds occur in valleys in the interior. Mountain ash, in the interior; Juniper (red cedar or pencil cedar) east coast of Vancouver, and along the shores of Kamloops and other lakes in the interior.

There are already some very extensive saw mills in operation—and have been cutting for a quarter of a century—and yet this branch of industry is only in its infancy. Not only is there the trans-Pacific trade, gigantic as it should soon be, but with cheap freight rates the treeless plains of the northwest could be readily supplied and profitable interchange of commodities spring up.

COLUMBIA'S BIG TREES.

The Montreal *Gazette*, referring to the Canadian Pacific railway exhibits at the Dominion exhibition, has the following regarding the extensive timber of British Columbia.

In entering the tent the attention of visitors is first drawn to the samples of the enormous timber which grows on the Pacific coast. The largest is a specimen of the Douglas fir, so called after Sir James Douglas, the original (Hudson's Bay Co.) governor of Vancouver island and British Columbia, which, in 1859, were two separate Crown colonies. This tree is also known commercially under the appellation of "Oregon pine." It grows to a height of some 270 feet, and the trunk is not only very valuable for ordinary lumber, but has a special usefulness for ships' masts and spars, of which cargoes are made up for all parts of the world. Among ports most constantly supplied direct from British Columbia are Marseilles, Sydney, Hong Kong, Calcutta, Singapore, besides the naval dock yards of Great Britain. The specimen at this exhibition is a section of about one foot in thickness and has a diameter of eight feet. The age of the tree is estimated by a computation of the rings which indicate the annual growth, and show it to have been 561 years old when it fell a victim to the axe of the woodman. In the immediate vicinity of where this tall tree grew were stumps, one of the largest of which measured seventeen feet six inches in diameter. Those who feel an interest in yachting may like to know that it is timber of this class obtained from Oregon, British Columbia and Washington Territory that the masts and spars of celebrated racing yachts such as the Puritan and Galatea are supplied. Owing to these trees growing so close together and to such an enormous height, frequently 150 feet without a limb, the grain is exceedingly free from knots or faults of any kind. The quantity in existence in British Columbia is very great, but owing to the lack of snow in the valleys where the largest specimens grow, special means have to be employed to transfer these giants of the forest to points where they can become merchantable products. The other specimen mentioned is of British Columbia spruce, also a very valuable timber. It measures seven feet in diameter. Between these sections of timber, on a pedestal, is displayed a block of coal from the Galt mine at Lethbridge, in Alberta. It weighs some 800 pounds and was cut out specially for this exhibition. Though not adapted for every purpose this coal makes an exceedingly valuable fuel; it burns with a hot flame and is used in Manitoba in open grates, in globe heaters and cooking ranges, and is sold at present at $6.50 per ton. The utilization of the black diamonds of the Northwest has effectually solved the difficulties of the fuel question, which previously oppressed the minds of the residents in this part of the country six or seven years ago, at a time when the somewhat meagre supply of available timber for Manitoba was being rapidly exhausted and when hard coal, imported from the United States in bags, brought $25 a ton.

HINTS ABOUT CILCULAR SAWS.

When hanging a saw the first thing to do is to see that the saw is true and straight, and that the mandril is correct in every particular. Examine the collars with a straight-edge, and see that the steady pins when driven into the collar have not raised small bunches around them by being too tight. If there are bunches they should be taken off with a file or cold chisel. The fast collar should be slightly concave on its face, but should never be convex; the loose collar may be straight faced. The mandrel and steady pins should not fit too tight into the saw, for if they do the least warmth in the journal box will expand them and cause the saw to bind or spring. When the saw is fastened between the collars it should be perfectly flat on the log side, but if found to be bulging or wavy loosen the nut to see whether the fault is in the saw or the collars. This should be carefully seen to before using it. The arbor should have some end play, and the guide should be one that can be adjusted in or out. The pins of the guide should run as close to the saw as possible without producing friction. The saw should hang so that the front edge inclines slightly toward the log, so that the back edge will not cut or scar the log. Some of these points may be considered fine-haired by some persons, but they are essential to first-class work and ease of running. When a top saw is used, it should drop down into the kerf of the lower saw about three inches. For good work the top saw should run in an opposite direction to the lower saw, and should have a spring guide which will allow to follow any irregularity in the track of the lower saw, but which will bring it back to it neutral position when out of the cut. Water should not be put on a running saw when it is hot, as it will spoil it. Water may sometimes be used on a saw running in pitchy or gummy wood to keep it clean or prevent friction. When this is done a small stream should be directed near the eye of the saw of both sides, when by the centrifugal action of the saw it will diffuse itself evenly over the whole surface.

The arbor boxes should be what is technically known as water boxes, as they are better calculated to keep the arbor cool. When an arbor becomes heated the heat is conveyed to the saw, causing it to be limber and "run bad." The speed of a saw should be from 12.000 to 15 000 feet per minute, though saws have been run as high as 20,000 feet per minute.—*Wood and Iron.*

THE BUSINESS OUTLOOK.

After months of the deepest business depression, affecting all lines of trade of the entire country, favorable indications were seen at the time for fall business approached. The marked increase in volume, and margin of transactions, that characterized the beginning of September, were augumented day by day, throughout the month, and to-day the country enjoys a genuine business boom, that has all the appearances of permanency. It has not been brought about through speculative methods, but from the honest needs of a rapidly growing and needful country. A stimulus has been given to trade that bolsters up the hopes of all merchants, that few dared dream of a few months ago. The best element of the present boom, the most cheerful aspect lies in the conservative and solid basis upon which it is made. Confidence is everywhere established, and the business world takes on a new hope, buys liberally, and prosecutes with vigor and faith, certain that energy will be repaid. The condition of the trade is healthy. The iron business, which is generally the leader in an upward or downward move, is a pretty good barometer of the business tendency. That iron has taken on the most activity ever known in this country, is a pretty clear indication of the approach of good times. All old blast furnaces, and many new, are running at full capacity, and hundreds are contemplated and in course of construction. Iron enters into about every branch of manufacture, and consequently the present enormous output is a pretty good test of the faith the iron men have in the stability of the country, and the needs of the near future. Its a good index to base operations on, if we had nothing else for a guide; but we have.

Reports gathered from almost every line of trade indicate a largely increased business over last fall. There is no doubt but that stocks of all kinds are exceedingly low in the interior towns, and merchants must buy largely to replenish their stock to meet the demands. There is a short European crop, while flattering accounts are made as to our own panning out largely in excess of midsummer estimates. More cotton will be baled in the South than was anticipated. Cereals, lumber, iron, real estate, in fact, all properties, are increasing in values steadily. The demand will be good for all of next year, at least. The only danger lies in over-production and especially is this the case with the manufacturers of lumber. The Northwestern Lumber Manufacturers' association can do much to prevent this deplorable outcome. They have shown their ability to grapple with the situation by their joint movement in the past. They can curtail the cut, so as to meet the requirements of the country and sustain fair prices, or, they can overproduce and unsettle values.

Its a difficult problem to contend with, when lumber is advancing in price. Every lumberman wants to cut as much lumber as the capacity of his mill will turn out. Owing to the short sawing season this year, it may not be deemed expedient to reduce the amount of logs to be banked the coming winter. The present is what we have to deal with, and the immediate future prosperity, and we are pleased to chronicle a very bright view.

The railroad reports show phenomenal gains in earnings. Seventy-five of the extensive lines show a gain last month of nearly $4,000,000. The main trunk lines are crowded beyond their capacity to handle shipments. The post-office, express, and bank clearances denote only too clearly the enormous amount of business transacted the past month, in comparison with the past. We are certainly on the eve of a prosperous season.—*Chicago Lumber Trade Journal.*

THE BULGARIAN CRISIS.

The People Will Not Yield to Russian Dictation.

SOFIA, Sept. 30.—General Kaulbars to-day received a deputation of prominent Bulgarians, who called upon him to endeavor to induce him to withdraw or modify his circular. The deputation was composed of 114 of the most respected and influential citizens of the principality, and was headed by Dr. Voultcheff, who acted as spokesman. He stated to General Kaulbars that the circular had surprised the Bulgarian people, and asked him to re-consider the Russian demands, particularly for the postponement of the elections for two months. The nation was anxious, Dr. Voultcheff continued, to speedly settle the choice of the prince to occupy the Bulgarian throne. In addition to that modification the doctor said the people desired Russia to withdraw her demands for the immediate raising of the state of seige, and also the demand for the instant release of the garisoners in custody for the complicity in the coup d'etat. The continuance of the state of seige was the only guaranty the Government had for the preservation of peace, which the rest of Europe desired as well as Bulgaria. The Bulgarians, believing that the Czar had no desire to prolong the crisis, begged Gen Kaulbars to telegraph to him to hasten the choice of a Prince. The constitution stipulated that the Grand Sobranje, elected to select a ruler, should meet within one month after the elections. In regard to the liberation of political prisoners Dr. Voultcheff said it would be a dangerous precedent to establish, to liberate without trial or punishment those responsible for such a momentuous an act as the deposition and kidnapping of Prince Alexander, besides being contrary to the laws which were the safeguards of the country. Besides, if the prisoners were released as demanded, the probabilities were that the people would kill them in the streets, such was the popular indignation against the implicated men. The Government thought the imprisoned officers should be tried first and subsequently offered clemency. In conclusion the deputation assured Gen. Kaulbars that Bulgaria was thankful to the Czar for his past protection, but maintained that the laws of the country must be respected. No other Ministry than that at present in power could extricate the country from its crisis. Gen. Kaulbars in reply, said the Bulgarians knew very well that the Czar had the prosperity at heart, but they must confide in the Czar, and carry out his wishes. Dr. Voultcheff interrupted Gen. Kaulbars at this point, and said, "If that is all you have to say, we will retire." The deputation then withdrew.

AWFUL POWDER EXPLOSION.

Four Men Blown to Fragments—A Building Completly Wrecked.

BARLOW, N. Y., Sept. 30.—A terrific explosion occurred at the Ditmar Powder Works, at Bay Chester, on the Harlem River branch of the N. Y. and N. H. R. R., about ten o'clock this morning, resulting in the instantaneous death of four men who were employed in the factory. The explosion occurred in the packing house. The men were putting up and packing cartridges when the explosion occurred, shattering the building to splinters, and blowing the four men to fragments. The exploding powder, of which there was a large quantity, shot up in the air as high as 50 feet, and splinters of the building were blown a great distance. The names of the men were Earnest Dralen, John Rusch, Max Shafbolt and Reinhart. The foreman of the works says the explosion was caused by two fellows shooting into the building.

THE FISHERY DISPUTE.

Views of the United States Government—Discussion Inopportune.

NEW YORK, Sept. 30.—The *Tribune's* London correspondent says:—The American Government, while desirous of coming to to some amicable understanding on the points in the fishery dispute, is understood to consider the present an unfavorable time for entering upon the discussion. When Great Britain shall have brought Canada to reasonable views, and when Canadian irritation has subsided, a good understanding between the two countries may be embodied in a suitable treaty.

AT THE INDUSTRIAL.

The C. P. R.'s Exhibit From the North-West at Toronto.

The Canadian Pacific Railway made a splendid display at the Toronto Exhibition of Northwest products and minerals. Of it the *Globe* said:—The exhibits in this building are extremely good, and ought to attract much attention. Entering from the south, several large lumps of a reddish substance, on the first table, will be noticed. According to the label attatched, this is rock salt for horses and cattle, and sceptical curiosity needs only to rub its fingers across and put them to its mouth to be convinced that the label speaks truly. The same table supports bags holding fine samples of oil cake in various conditions, broken and otherwise.

This exhibit, however, good as it is, will not long detain the visitor's attention from the most striking feature in the whole building—the exhibit which is made by the Canada Pacific Railway, and which illustrates the productive powers of the whole country along its course to the Pacific ocean. It is an admirable display, both for its extent and its impressive character as a whole, and for the variety, excellence in quality, and skill in arrangement shown in the way of details. The attention of even the slowest observer, will hardly miss the gigantic section of the British Columbia spruce tree, which stares him in the face. It bears a legend, telling its birthplace and that it is 7 ft. in diameter. At the foot of this trophy, and on either side, either lying exposed, or kept from thievish hands by glass cases, are fine specimens of the mineral wealth of the great Canadian North-West Territories. At the other end facing the north entrance, is a similar trophy, the tree section being fir, and eight feet in diameter between every two of the supporting pillars of the building a miniature arch is constructed by means of bundles of prairie grasses and different sorts of grain. On opposite sides of each pillar are affixed the splendid specimens of the fauna of the North-West. On the tables below, in almost bewildering variety, are arranged samples of the agricultural wealth of the same region

IMPERIAL POLITICS.

Lord R. Churchill on the Conservative Policy—The Unionist Combination.

LONDON, Oct. 2.—Lord Randolph Churchill speaking at Dartford to-night, said the House of Commons was the slave of the caprice of the Radicals and Parnellites. It was imperative to provide a simple and effective means of closing debates. If Ireland followed the advice of agitators such action would lead to further repressions, but Irish commerce had begun to improve and with the present good harvest the people of Ireland might anticipate brighter times.

With regard to affairs in Bulgaria, he said it was impossible to foreshadow the outcome, but he still hoped a peaceful settlement would be effected. England ought to support Aurtria in her difficulty.

Lord Churchill spoke in praise of the loyal support which the Government had received from Lord Hartington, Mr. Chamberlain and all of the Liberal-Unionists. He said that foreign affairs would be subordinated to the Union and the Unionist party. The Government recognized the sacrifices which the Unionists had made and the odium which they had incurred among their former friends; therefore, it was the duty of the Government to prove to the people of England that the Unionists were right in the course they took. The Government would give the greatest attention to legislation affecting England and Scotland, which had lately been neglected for Ireland. It would introduce measures to enable farm laborers to obtain freehold allotments, and would also deal with the questions of tithes and railway rates, measures for cheapening the cost of transfer of land, and a genuine popular form of local government would also be presented. With regard to the land question in Ireland, they would have to change from liable to single ownership in order to have peace. On all of these questions the prospects were fair, although the work would be heavy. He did not believe that there would be harsh evictions in Ireland.

The lumber season of 1886-7 has opened, and in there is considerable activity, Men are being hired by the agents of the different lumbering firms to be sent off to the various timber limits. Mr. J. M. Irwin shipped thirty men this morning per Grand Trunk Railway for Scarburton district. This gang followed another party of forty-five men who were sent last week. The gangs will operate in the townships of Dysart, Havelock, and others adjacent. Mr. Kelly, who is stoping at Cavanagh's hotel, is hiring men for the Stricklands to go to the Georgian Bay district. The wages paid vary from $15 to $20 per month.—*Peterborough Review.*

A NEW EXPLOSIVE.

General Boulanger's New Bombs and Their Destructive Properties.

PARIS, Sept. 29.—General Boulanger desiring to secure from the Government an appropriation of $25,000,000 for the most explosive bombs, recently invited the Budget committee to witness the experiments he has been carrying on in private. The experiments were made with a monster mortar, designed as a type for the destruction of fortifications. The missile, which explodes with exceedingly destructive effect, is charged with a new explosive, of whose composition General Boulanger and his associates alone possesss the secret. The compound, however, is admitted to have all the powers of gun cotton, with none of its defects, and is said, in addition, to be easily transportable and to be free from liability to spontaneous ignition. It is stated that the budget committee were not only highly satisfied with the results of the experiments, but promised to fully support General Boulanger's demand for a special appropriation.

MINDEN.

ACCIDENT.—Mr. Eastman, of Snowdon, was bringing some young cattle to the village with their heads tied down to their front feet, and got two of them into the water at the Ingoldsby Narrows, which were drowned before they could be rescued.

LUMBERING.—The different lumbering firms have a large number of men in the woods north of Minden. Nearly every day fresh arrivals take place. Considerable energy is being evinced here this season in lumbering operations.

CONFIRMATION.—One of the most interesting events that has transpired in this village for some time past was the confirmation service in St. Paul's Church, Minden, on Tuesday evening last, when Rev. J. G Dean presented no less than forty-eight candidates to His Lordship, the Bishop of Toronto to be confirmed. Thirty of the candidates were females and eighteen males. The services were of a very solemn character and the addresses of the Bishop was most affecting. His Lordship very clearly explained the nature of the ordnance and the duty of the candidates. His address was listened to with great attention and marked effect upon the very large congregation present which filled the church to overflowing, notwithstanding the late hour at which it was held, 8 p. m. Some of the candidates and their friends had long distances to travel to reach here, but all expressed themselves highly pleased with the results. A liberal collection was taken up for missionary purposes. His Lordship was the guest of Mr. and Mrs. J. H. Delamere during his short visit, and we understand he expressed his delight with the progress church work is making in this mission.—*Echo.*

AQUATIC CIRCLES EXCITED.

A Check Given by the Promoter of the Henden Regatta Dishonored.

LONDON, October 2.—Aquatic circles were much excited last night over rumors that the £300 contributed to the prize fund of the proposed Henden regatta by J. H. Craig, of New York, has turned out to be only "straw." When the oarsmen paid their entrance fees on Wednesday, Craig, the promoter of the regatta, handed to Mr. Alison, editor of the *Sportsman*, as stake holder, a check for £300, payable at Gillig's American Exchange. Mr. Alison presented the check for payment, but it was dishonored. Mr. Alison then announced that he would provide the stipulated prizes and to take charge of the gate money. Craig's name is really Rushnell, and he has resided in New York and Toronto. He has several times refused to give his address, on the grounds that reporters would hunt up his mother and frighten her to death with stories of his being in trouble in a foreign country. Mr. Alison has had several stormy interviews with Craig. Craig pleaded for delay, alleging that the number of drafts which he should have received from America had miscarried. He had plenty of money at his command, he said, and as soon as his drafts came to hand he would pay over the amount of the check. Very little credence is given to his statements, however, as on the night that the entries were made at Putney, a bootmaker vainly dunned Craig for £25 which he had bet on the result of the Gaudaur-Beach race.

The Cashier Pardoned.

TRENTON, N.J., Oct. 2.—J. A. Hedden, the cashier of the First National Bank of Newark, who wrecked that institution by embezzlements and was sentenced to five years' imprisonment, was pardoned yesterday by the President.

General News Notes.

THE planing mill of Smith & Clark, Victoria, B.C., was recently burned.

AT Calgary, Alberta, lumber from the Pacific slope is reported to be selling at the same price as that of local manufacture.

AT Collingwood preparations are going on for the coming lumbering season. According to the *Bulletin* this winter promises to be one of unusual activity.

MESSRS. RALSTON & IRWIN have just succeeded in effecting a sale to a northern Michigan lumbering firm of five pine limits on the north shore. The total amount realized for the limits was $100,000.

THE Water Mill of the Parry Sound Lumber Company was again started last Monday, the recent rains having given a sufficient head of water. The mill will be kept running as late as possible this fall.

A RAFT containing upwards of 2,000,000 feet of saw logs broke away from the wharf at the John Spry Co. saw mill, Michigan Sault during the gale of Sunday night week and made a free run down stream. The loss is a severe one.

DURING the coming winter the cut of saw logs in the Parry Sound district will be the largest ever taken out. Already many camps have been established and active preparation for a big season's work are being made,

A YOUNG man named Harvey Ford, working in Hudson & Wilson's saw mill at the locks, near Huntsville, on Tuesday of last week, had the misfortune to get his right hand too near one of the saws and had the forefinger amputated.

EVERY limit of any value in the Ottawa District that has been offered for sale of late has been readily disposed of, mill-owners realizing that a day is coming when those who do not own limits will find it difficult to obtain logs to keep their mills running.

A PARTY of Canadians have bought 50,000 acres of timbered land on the Little Tennessee river, Tenn., and want to buy 100,000 acres more. Their object is to cut off the timber, develop the mines, if any, and settle the lands with Swedes, Swiss and Scotch.

THE Ottawa *Citizen* says:—"Mr. J.R. Booth has laid up three large rafts to winter over at Malloch's boom, Arnprior, having decided not to put them on the Quebec market this year. There is said to be more timber being sent to Quebec this year than there has been for several seasons."

THERE are considerable prospects of a big output of lumber this season if the number of men going to the woods may be taken as an indication. The agents all agree that it is a number of years since they have found the demand for labor brisker. The number of men being shipped up the river is unusually great.

MESSRS. Cousland and Adams from Glasgow, Scotland, have arrived in Ottawa to look into the possibility of extending the timber trade between Canada and Scotland. They are favorably impressed and several suggestions they have been made are likely to prove of great advantage to Canadian shippers.

THE St. John (N.B.) *Globe* reports that the river tugs are practically idle at the present time, all the logs that were in the booms having been rafted and towed to their destination. The quantity of lumber brought down the river this year was much larger than that of last season, but more than 25,000,000 feet of logs are high and dry along the small streams, and cannot be brought out unless there is a heavy freshet, which is improbable this fall. The water in the river is very low at the present time.

GRADING on the Duluth & Manitoba Railroad between the Northern Pacific Junction and Red Lake Falls, Minn., is about completed, and track laying is in rapid progress. The line between Red Lake Falls and Grand Forks, on Red River of the North, is under contract. Red Lake Falls, says the Minn. *Lumberman*, promises to become an important mill point, since the Red Lake pine region is tributary by way of Red Lake and Clearwater rivers. The new road will furnish a shipping outlet for sawed product, east, south, and west,

J. & T. CONLON, says the *Expositor*, have shipped about 60,000 ties, some 17,000 pavement posts and 1,000 telegraph poles from the Manitoulin this season, and have four cargoes of ties still to ship. They have also bought the Burpee saw mill and are getting it fitted up to cut ties and lumber this winter. Besides this they have a floating saw mill at work on Lake W. Keeley which is turning out over 500 ties per day.

A DISPATCH from Duluth to one of the daily papers of this city, and printed on Tuesday, stated, with considerable flourish, that the Grand Haven Lumber Company, of Grand Haven, Mich., had lately purchased the Pillsbury pine, to the amount of 650,000,000 feet, and had begun operations for cutting a large amount the coming winter. The truth of the matter is, as stated by a representative of one of the parties in interest, of this city, that S. B Barker and H. C. Akeley, and perhaps others of the Grand Haven Lumber Company, are interested in a contract to put in and manufacture the Pillsbury pine, situated in the region of Lake Itasca, Minn. This pine is understood to comprise nearly or quite 1,000,000,000 feet. The contract will probably necessitate the erection of a mill at Minneapolis, or some other point convenient for receiving the logs and shipping the sawed product. It is intended to bank about 15,000,000 feet of logs this season. The operation will be carried on by a corporation called the Itasca Lumber Company, which was some time ago formed by the interested parties. —*N. W. Lumberman.*

MR. HARRY DONALD, well known in business circles at St. John, N. B,, was ,says the *Globe*, recently arrested on a bailable writ for $25,000 at the instance of Messrs. Guy, Bevan and Co. Mr. Donald was at one time manager of the firm's business in Mobile. It is alleged that while acting for them he entered into a secret partnership, and used the credit and endorsations of the firms without their knowledge to advance his own interests, to the neglect or disadvantage of those of his employers; that he became possessed of a large milling property there, and that the property so obtained was fradulently obtained. Donald went to England and while he was absent a party was sent from New Brunswick to examine his books, with the result alleged above. An effort was made by Mr. Bevan, while Donald was in England, to arrest him, but this failed. Since his return, Mr. Donald has been carrying on a shipping business in the United States, and desiring to visit New Brunswick, he, it is said, consulted a lawyer in New York, and was assured that he could not be held here on any charge such as it indicated above. He was arrested, however, and lodged in jail. His council, Mr. Fred Barker, Q C., M.P., made application to Mr. Justice Tuck for his discharge, and his honour gave the parties a hearing to-day, Mr. C. N. Skinner, Q.C, appearing for Messrs. Guy, Bevan and Co. Mr. Donald is a native of St. John, and is well known here. He married some time since a Southern lady of wealth and position, Judge Tuck decided to discharge Mr. Donald on the ground that the fraud charged was not clearly set out in the writ. As soon as he was discharged Mr. Donald, acting under advice of his counsel, left St. John for the United States. —*Miramichi Advance.*

Indians Becoming Bolder.

WINNIPEG, Oct. 2.—A despatch from Indian Head says: The Indians are becoming bolder each day. A man named Gaurdapie while guard property for the Medicine Hat range company, about twenty miles away, was held up by eight Blood Indians and relieved of his rifle, revolver and everything else of any value. Horse stealing has begun about there. The police outposts were ordered in.

Bridge Brilding.

Mr. W. H. Law, of the Central Iron and Bridge Works, has returned from Millford, Prince Edward County, where a new ninety-six feet span iron bridge, made at the works, was opened for public traffic. The Warden of the county and members of the County Council, the Reeve and Councillors of the township, and a number of prominent people from Picton, were present on the occasion of the opening of this, the first iron bridge put up in the county. Speeches were made by prominent men. Everything passed off with entire satisfaction.

CANADIAN TIMBER IN ENGLAND.

The *Timber Trades Journal* of London, Eng., in its issue of Sept. 15th, reports the following arrivals from Canada:—The London arrivals since our last include the *Capulet*, from Quebec, which entered the docks with Saturday's tide, and the *Crete*, from Montreal. Both these were big steamers, and had evidently met with bad weather on the way. The *Capulet*, seems to have got knocked about in the Atlantic, and when she came up the river had a very dangerous list, her cargo having shifted during the voyage. We can understand grain cargoes shifting, but, though it is by no means uncommonjto find wood laden steamers lopsided, we cannot help thinking it must be due to careless stowing. The fact that sailing ships are hardly ever noticed in that predicament would seem to bear out our view. Steamers are always in such a violent hurry to get away that they bundle the deals into the hold, and stow them anyhow, with the result that when straining at sea a plank gets out of its place. Another difficulty in the way of making good stowage is picking up part cargo at different ports; the goods are jumbled up, and liable to break away at any critical moment. Insurance companies should look to this.

The imports from the 2nd up to date to London amount to 53, of which 30 are steamers, and include five pine laden vessels from Montreal, the *Crete*, part deal laden, and the *Capulet*, with 60,000 deals. for Messrs. Bryant, Powis, & Bryant. The *Crown Prince*, from Pensacola, with sawn timber and planks, for Mr. G. M. Freebody, has gone into the Surrey to discharge, having delivered a parcel of cedar on the Middlesex side. Amongst the largest of the Baltic steamers is the *Kotka*, from Cronstadt, with deals, for Messrs. Simson & Mason. Taken altogether, the import is a full average one for the time of the year. A larger proportion of these cargoes than usual, we notice are going overside, the endeavour being to save if possible dock expenses.

We note the arrival at Liverpool, of Messrs. C. C. Bowring & Co.'s s.s. *Romeo*, from Montreal, with a full cargo of pine lumber shipped by Messrs. Robert Cox & Co., for their Liverpool house. This is, we hear, one of the largest, if not the largest, consignment of lumber ever shipped from that port, for one firm's account.

AUSTRALIAN LUMBER TRADE.

The growth of the lumber trade of the Australasian colonies has been extraordinary within the last few years. The total quantity of rough and finished lumber imported into New South Wales alone during the year 1885 was 65,822,037 feet, valued at $2,296,760, against 49,608,825 ft, valued at $1,903,990 for 1884. The imports from the United States increased nearly 10,000,000 of feet or from 13,782,746 feet in 1884 to 23,165,235 feet in 1885. The principal increase in American lumber has been in the rough descriptions.

In the supply of lumber for the colony of new South Wales, the United States takes the lead of all other countries; New Zealand comes next and British Columbia third on the list. Norway furnishes the largest share of dressed lumber, a fact probably occasioned by the low price of labor in that country. The imports from America consist principally of pine and redwood from the various states and territories on the Pacific Slope.

New markets are being opened up from the product of the saw mills in California, Oregon and Washington Territory every year, and active preparations are being made for its shipment in larger quantities than ever, not only to Australasia but to Japan and others countries. The popularity of America lumber in the Australian colonies has excited much opposition on the part of those interested in the sale of Australian timber, and efforts are being made to increase the import tax on lumber. The present duty is 48 cents per superficial feet on dressed lumber, and 24 cents per 100 feet on rough lumber.

Our readers will confer a favor on us, when writing to advertisers, if they will state that they saw the advertisement in the Canada Lumberman. This costs the correspondent nothing, but helps us materially.

DOES CHARRING TIMBER PROMOTE DURABILITY?

The general belief has long been that it does, and in accordance with this conviction the practice has been widely followed. But a contrary view of the subject is taken by *Wood and Iron*. That journal says in a recent issue:—As charcoal would endure for ages in places where timber would decay speedily, the practice of charing the surface of fence-posts and other timber has been repeatedly recommended in books and ephemeral publications, as eminently worthy of universal adoption.

The theory upon which such a recommendation is based would seem to warrant a confident expectation of satisfactory results in practice; but repeated experiments with charred timber have furnished conclusive assurance that this process will not promote its durability. Indeed, numerous experiments have shown that charring promotes premature decay. Two posts split from the same log may be set side by side in the ground, the surface of one being charred and the other not; and it will be seen that the charred post will perish before the other.

The same is true of railroad ties, and all such timber as may be exposed to the alternating influences of wet and heat. Could the entire timber be changed from its perishable condition to one solid piece of charcoal, the durability would be promoted to a surprising length of time; but the strength of the material would be destroyed. When fence posts or other sticks of timber are exposed to the rapid action of wet and heat, the surface will decay first. One might suppose, therefore, that when timber is enveloped by a layer of charcoal, the durability of the entire piece would be greatly promoted. And such would be the case were it not for the fact that the charcoal is not impervious to water; and as water reaches the timber below the charred surface, decay will commence soon after the grain of the wood has been exposed to the influences of the weather. When the change has once begun beneath the charred surface the durable covering of coal will be of no service whatever in preserving any portion of the wood. Taking this practical view of the subject, it will be perceived that if only half an inch of the outside of a post be charred, the post will not endure so long as if the same thickness of wood had been left uncharred, to waste away by slow decay.

TREE FELLING BY MACHINERY.

Machinery and steam power have been adapted to almost all the operations of lumbering but one—the process of cutting down the trees. For that purpose the axe, swung by the strong arms of experienced men, has not in America been superseded to any appreciable extent by any mechanical device. To be sure, the immense trees of the Pacific slope are cut through by saws, but the saws are worked by hand, and even cross cut saws have not displaced the axe, except where the size of the trees made it necessary. At least one tree felling machine is used abroad, made by a London firm, but it is not to be found in this country. Perhaps it was the success of the English machine that induced William E. Hill, of "steam nigger" fame, to invent a similar contrivance which he offers to the American saw-mill public. Its main part is a steam cylinder five feet long, five inches in diameter, with a bore of four inches, and having a piston stroke of thirty inches. The machine stands upon low skids, and by means of trunnions and a swinging table can be adjusted to any position desired. The front end of the cylinder has a swivel head with a stuffing box, to which the slides are fastened, thus allowing the saw to be turned to make cuts at any angle. The machine is anchored by dogs to each side of the tree to hold it steady while in operation. The success of such a device, besides mechanically correct construction, depends principally on its cheapness of operation and the quickness with which it can be moved from one tree to another. Its weight is 425 pounds, and it is driven by a 2-horse power steel boiler. The machine is evidently powerful and efficient when once in action, but the cost of operating it must be demonstrated by practicle experience.—*Boston Journal of Commerce.*

THE LUMBER TRADE.

The Fort William, Ont., *Echo* says:—The lumber trade on the Kaministiquia is one which is deserving of considerable attention at the hands of district journalists. Few residents are aware of the amount of money and labor expended in producing the material which so largely enters into the construction of their churches, dwelling houses, stores, hotels and public buildings. yet a visit to the mills down the river would open the eyes of very many to the importance of this growing industry. At the mill of Graham, Horne & Co. a busy scene presents itself to the eye of the visitor. Saws and plainers keep up a busy hum "from rosy morn till dewy eve," 30 men are constantly employed and 10 more are wanted in consequence of the rapid growth of their business, their shipments reaching nearly all points in Manitoba and distant towns in the Northwest. As an illustration of the rapid development of their trade we may mention that where last year they only had one little drying shed they are now engaged in erecting several others the total length of which will be 1,000 feet. This fact speaks for itself and needs no further comment at our hands. Messrs. G. H. & Co. are doing well, and the energy which they are displaying in extending their trade relations show that industry, perseverance and talent can do much when well applied.

Proceeding down and on the south side of the river, we come to the extensive establishment of W. H. Carpenter who owns two mills and makes quite a noise in the world. Mr Carpenter has 40 men employed, is now making arrangements for sending 300 choppers into the woods this season and will get out at least 3,000,000 feet of logs.

The Neebing Lumbering Company also propose to extend their operations, but will most probably confine themselves to the production of shingles.

Messrs. Hammond, Crawford, Corbett and others are talking of doing an extensive business in the tie and pile line, and others are likely to engage in the same business if fortunate enough to secure contracts.

We don't fatigue readers with figures, but leave the statisticians to figure up the probable amount of money that is being and is likely to be expended by the Kaministiquia lumber dealers in prosecuting their calling during the season of 1886-87 Sufficient, however, has been shown to prove that the lumber trade of Fort William is rapidly increasing in volume, and from past and present experience can be worked up to a much greater extent by the infusion of new capital and energy.

The forest fires of this season unhappily destroyed millions of feet of standing timber, but, we are informed, the mill men have entered into an agreement whereby the owners of limits are to first cut all trees that are scarred and then take those that escaped the fiery ordeal.

This is a wise step and one which we hope to see followed in order and more wealthy districts, as by so doing the lumberman will not only assist themselves but will also help Dame Nature in her efforts to present to the visitor a series of panoramic views unbroken by the disfigurements which result from forest fires.

MANUFACTURED FROM WOOD.

"Business is good with us," said a dealer in woodenware to a reporter the other day, "but prices are so low that it requires an immense number of sales to amount to much in dollars and cents. Competition has lowered prices considerably, but there is another factor at work upon the prices of woodenware, which does not affect any other articles to an equal extent."

"What's that?" asked the inquisitor.

"Machinery. Lathes have been invented to turn out almost anything in our line and other machinery has been perfected, until the wooden ware manufacture is almost entirely done without the aid of man's hands. Now take butter trayes for instance. The tree is cut down and shaped by taking off the bark. Then it is run through a machine which cuts it into veneers about the right thickness for the tray. Then these veneers are sorted and the sound ones are cut by a stamping machine into the right size, leaving lappets which fold over. These lappe are sewed together by hand and then a m chine fastens on the tin edges. It takes as lo to tell about it as it would to make dozens them The work is done so rapidly that the time one tree is split into veneers, the pr ceding tree has been made up into trays. Th are sold in bulk in New York for them $2.75 $5 per thousand, according to size The wo en picnic plates which have come into within the last half dozen years are made i similar way."

"What woods are employed in the manufa ture of these trays?"

"Mostly gum, white cedar, beech and ot similar woods."

"How much are those pails?" asked the r porter, pointing to some three-hooped wood pails that were piled up in one end of the sto

"They are quoted at $1.15 per dozen in N York," was the reply, "a price which seems credible unless you know how they are ma Wooden shooks, the size intended for the pa are fed into a machine and come out at t other end a complete pail, with three hoo fastened on even better than could have be done by hand Another machine paints t pails both inside and out, usually white on inside and an oak tint out on the outsi Washtubs are made on the same principle a are sold at the factory at the rate of $2.25 eight, representing the different sizes in ord ary use.

"In the manufacture of washboards, the t ber is often given two years to become thoro ly seasoned. Then, by machinery almost tirely, the wood is manufactured into wa boards of all grades and sizes. Although m of the washboards are manufactured in an of the way quarter of the world, they are s at 80 cents per dozen.

"It is the same with nearly every branch our trade. The genius of man has construc machinery which can cut wood into every f and shape conceivable, and the result has b the rapid decrease in prices, until a whole st full of stuff represents but a few thousand lars, and what several years ago would h netted a profit of a million would scarcely m to-day a profit of a thousand. But I guess have reached bed-rock. If prices fell much low the present figures we would be sel goods for less than the wood in the rough w bring."—*Lumberman's Gazette.*

A GREAT CHIMNEY.

The highest chimney yet built in the w has recently been completed at the Mecher lead works in Germany. The whole heigh the structure is approximately 440 feet, 11 of which is underground. The subterra portion is of block stone, 37 feet square in p all the rest is of brick. The plinth, or l part of the chimney above ground, is 34 square, so that the height of the shaft is ne thirteen times the lower diameter. For a 34 feet the chimney continues square, then comes octogonal in plan for a little distance, finally changes to a circular form, retaining shape to the top. The exterior diameter of shaft at the top is about 11½ feet. The flue i feet in diameter at the bottom and 10 feet a top. Until the completion of this chimney, of the St. Rollix chemical works, near Gla which is 434 feet high, was the tallest in world.

Amongst other things British Columb celebrated for its Douglas Pines, many of w are too large to be disposed of by an ordi saw mill. Recently four logs were sawn Vancouver. Their dimensions were as lows:—

1 log 62 ft.	long,	40 in.	diam.,	congt'g 5 5
1 log 53 ft.	long,	44 "	"	" 5.6
1 log 36 ft	long	55 "	"	" 5.6
1 log 24 ft.	long.	56 "	"	" 4 0

The Quebec *Chronicle* finds the t market to be even duller than it usually this season of the year. One raft of Ot timber, about 47 feet average changed h at 16 cents. In deals there is little doin the sales in the principal markets of Britain are being effected at prices entirel low to pay shippers. Pine are not as enquired for as they were, and spruce are of sale.

FREE LUMBER.

housands of our citizens have been led to be- that a removal of the duties on the import anadian lumber would have a tendency to erve and protect American forests. This allacy. The removal of the duties would ly advance the profits of the Canadian lum- nen to the extent of the reduction, though per- stimulating production among the saw mills he Dominion to the detriment of our home stries. Our American forests are owned by viduals who are obliged to work them for r daily sustenance. Lumbermen would not don their lands or saw mills simply by rea- of the Canadian competitor getting his lum- in free of duty. The American operator ld feel that our Government had committed eat wrong should the Canadian who pays axes here, be allowed to ship his lumber to markets without duties, while the Ameri- perator is handicapped with a duty on his his saws, his tools, his blankets, teas, r and almost everything which enters into ost of his lumber. Yet the operations of Americ n citizen whose whole capital is sted in his timber lands and in his saw mill t must continue under the fiercest and unfair competition.

justice to our lumbermen would not save forests. Sound economy does not want to such old forests as have reached their th and are commencing to decay. Such eservation is a waste of valuable raw rial. A cutting of mature trees gives the ger specimens a better chance for life and th. The Canadian Government wants rocity, or, practically, free trade with this ry. This cannot be accepted by us with- erious impairment of extensive American tries. The Canadians have put up the t duty on pine logs to $3, and on spruce o $2 per thousand feet. On shingle bolts have fixed a specific duty of $1.50 per cord. avowed object is to prevent Michigan ermen, who have purchased timber lands e north shore of Lake Huron on a large from ratting the logs to the Michigan to be sawed. But the real purpose is er lever towards building up an American in favor of free trade in lumber. Can- writers on forestry are prolific in predic- of a timber famine in the United States do not admit Canadian lumber free of This is not wholly disinterested advice. ountry should afford the same protection lumber interest that it does to other ries. Free lumber would build up Can- d damage the lumbermen of this country, t any corresponding advantage to other ries.—*Manufacturers' Gazette*

HOW AXES ARE MADE.

he manufacture of axes, the material through twelve different operations be- is ready for labelling and boxing. At is a rectangular piece of iron, about three- of an inch thick, three and one-half wide, and about six inches long. The f steel, and in some instances is inserted t made in the iron, and in others it is over the edge of the iron. There is a g demand for axes made entirely of steel. ost important part of the process of man- e is tempering. "This is really where e is made," said a manufacturer. The g and polishing is the most laborious the process. It is here that the rough, ar shaped semblance of an axe is ground lished until it is as bright as a mirror. It that the work will prove fatal within five o any man who pursues it steadily. The lled with imperceptible dust from the and many of the workmen tie small saturated with water over their .

sawdust nuisance in the Ottawa river is complained of, and it is suggested that vernment could easily do something to it at this season of the year. Not only deposit beginning to affect the lower f the Rideau canal, but the frequent ns of gas generated by the pine dust eriod of submergation are stated to be gly dangerous to those taking pleasure boats.

LOAFING.

While there are many complaints made, from time to time, says the *Mechanical News*, about the dullness of business and the hardness of the workingman's lot, we hazard the statement that about one half of the hard times and business depression is the direct or indirect result of loafing—either good, or solid, square, old-fashioned, primitive loafing, or the modern revised version, which is called, for some occult reason or other, "soldiering."

There are very few honest, safe and profitable occupations in which success can be attained by sitting down and waiting for it, or is got by luck. There is more gold got out by patient labor than was ever brought to light by stubbing the toe against nuggets. The diamond fields are the scene of patient, plodding labor, neglecting no shovel-full of dirt.

There is a marked difference between workmen who are doing for themselves, or who are piece-working, as well as among those who are "by time." One man will loaf away an hour a day. It may be listening to, or watching his neighbor; or hunting a match or helping hunt one; or wondering what to do next; or it may be distributed all through the day by deliberate and careful attention to the science of slow moving as applied to the prevention of heat or rupture; but it is there, all the same; there is an unproductive hour or a day with a tenth or an eighth less work in it than it should have

A day's workman cannot afford to loaf. He may lose his place, for a selfish reason. He is not giving an honest equivalent for what he receives, for a moral one. He is getting into the habit of working slowly, which will interfere with his profits if he gets on piece-work—selfish reason No. 2. He is setting a bad example to others to render a poor equivalent for their pay - moral reason No. 2.

We could keep on piling up reasons of each kind against loafing, but they will suggest themselves; and then the case is somewhat analogous to the one where the lawyer announced twenty-nine reasons why his client did not appear at the trial. In the first place, he was dead. The second reason was that "the first reason was reason enough."

There are many foundries and factories, mills and shops, where no smoke issues from the stack and no rumble of work is in the air, and in which more energy and less loafing, on the part of proprietors and employes, would have enabled work to continue right along, at least at a rate which would pay hands and keep the business in public mind until times were better. Ten per cent. more work out of every man would not have strained any one and would have made just the difference between a slight loss in the business, and "expenses cleared." And that ten per cent. more work would have improved every man on the place.

We just heard an anecdote of a noted stenographer who drops into profanity if a day goes by without his having anything to do; not because he loses the earnings of that day, but because he loses speed. He gets some one to read fast to him, in order to keep up his speed.

Go into an engine room and see the engineer doing nothing all day, and you will see a man who will not earn any more ten years from now than he is now getting. Instead of loafing, he might be reading, or drawing his engine out to scale, or learning something about the machinery his engine drives.

The time for loafing is after work. Then it should be free and unreserved, and will be beneficial, and rightly earned.

ANOTHER most important event in the progress of the Dominion, which is held to be only second to that of the opening of the Canadian Pacific Railway enterprise itself, was the inauguration on the 13th ult., of that company's new Canadian telegraph system, with connections also in the United States as well as to Europe, by arrangements consummated with the Postal Telegraph and Commercial Cable companies controlled by William Mackay. The Postal Telegraph system completely covers the United States, being a union of all lines secured by Mr. Mackay that were dependent of the Western Union, including the American Rapid, the Northern Mutual and the Bankers and Merchants.

BRITISH COLUMBIA LUMBER TRADE.

THE great timber limits in the Province of British Columbia are rapidly being utilized, and the fact is not looked upon with much satisfaction by those engaged in the timber trade across the border. The *Northwestern Lumberman* referring to this subject, says :—

"Pacific coast mill men and lumber exporters must look out for competition from their northern neighbors across the national boundary. An important part of the lumber trade of California, Oregon and Washington territory mill men has been their exports of lumber. This trade has not been on the average very profitable, but it has been an outlet for surplus stocks and prevented a demoralizing over supply at home. The exports to the Australasian British colonies have been especially important and have largely increased with recent years. But co-incident with this increase has been the growth of the saw mill industry of British Columbia, and that province has already shown itself no mean competitor. The completion of the Canadian Pacific railroad, and the consequent awakening of enterprise all along its line will be particularly potent at its western terminus. The magnificent timber resources of British Columbia will be opened up rapidly, and will supply not only the lumber demand of the prairie regions to the east, but will be available for export. Other things being equal, it is to be expected that Australia will give the preference in making purchases to the products of a country to which it is politically allied. Moreover, the movement in Australia to bar out American lumber, in favour of that from New Zealand, by an almost prohibitory tariff, will not be brought to bear against the timber of British Columbia. Pacific coast operators should be awake to the situation. They may not be able to prevent the substitution of the northern product for their own, but there is yet time for them to largely occupy British Columbia if the field should seem a desirable one.

A SUCCESSFUL MACHINE.

The following flattering testimonial has been received by the Waterous Engine Works Co., of Brantford, reg arding the working of their 25 h. p. Portable Champion Mill.

RODGER'S PASS, B. C., August 26th, 1886.

The mill is and has been working all right as the amount she has cut since I started will show for itself. I have run steady ever since I started, never had to stop an hour, or cost them a dollar, so there is nothing in the way for them to settle. The mill was cutting in 28 days after it left Brantford—that is I started up on the 21st of June to cut, and up to date I have cut more than one million one hundred thousand (1,100,000) and we have to do the edging with the large saw. When the mill got here they said that it was too small, and that it was to be 35 or 40 horse-power mill, direct action, 60 in. saw and large carriage. A mill of that class would not have been any too heavy for the work I have to do. The logs are hard to cut, and at first they were too large, (4 feet diameter) for this small carriage and small saw, that is the reason the pulley and extra size saw were ordered. To cut the amount I am cutting, I have to work the mill and run the engine fully more than I should do, but I am as careful as possible to see that everything is kept right, and so far all has went well. Let me know if there was any stated capacity in contract. *Our average cut per day will be fully* 20,000 *and do the edging on the large saw*, and that keeps us so there is not much time to be lost. It is 1 in. boards and 3 and 4 in. plank, but it is all to be cut 14, 12, 10 and 8 inches wide. We do not saw any bridge or other timber. The most of the logs that we cut are spruce and cedar. The cedar is bad to saw, it is hard to make a saw to run right in it. Yours etc., JOHN LYLE.

The Loss of Power.

Start at your engine, and follow up your line of shafting, and figure up how many tons of excessive weight you have been carrying thereon, which to keep in motion, has been at a cost of from one to five horse-power per ton weight, according to alignment of same; then follow back and cipher your loss by slipping belts, and you will be surprised to find the sum total to be more than one half the amount of power you are using.—*John P. Morely, in Power and Transmission.*

A dispatch from St. John N. B., says: The Bangor lumbermen all agree in saying that the cut of logs the coming season will be much larger than for several years past. It is said that one third more concerns will operate than usual, and all will go in for a big winter's work. As yet no estimates have been made of the probable amount of the cut. A great many concerns are taking up the West Branch, but no permits have thus far been made there. More work will be done on Cumberland Lake than for some time past.

BAND SAWS.

Band saws are probably the coming machines for making lumber, where great economy of raw material is the thing to be most carefully considered. The experiments made, and the practical use of these implements during the last two or three years, demonstrate this much beyond any question. But because this is true, it does not follow that circular saws are to become obsolete. They have made too good a record to be disposed so summarily. There is no good reason for believing that circular saws will not be in great demand for many years to come, if they do not occupy a prominent place in the list of lumber cutting tools as long as there is lumber to be cut. Both the band and circular represent developments of the same principle; they both accomplish their work by means of a serrated blade moving rapidly in one direction, therein differing radically from the principle of the earliest sawing machinery—that of a reciprocating movement—the highest development of which is seen in the modern gang. So handy, effective, reliable and cheap an application of the principle of a continuously moving blade, as is found in the circular saw, cannot give way entirely to any improvement, however economical of timber it may be. For very many situations, the circular mill, of low first cost, adapted to more or less rough usage, not easily got out of repair, rapid in its work, and altogether a reliable device, is better fitted than would be the most perfect band machine, though it might cut a kerf no thicker than a sheet of paper. The fact that there are so many places of this kind which can be better filled with a circular mill than with any other sort of lumber cutting arrangement, insures for it a demand and popularity that will not be perceptibly reduced by the encroachments of the band saw upon its domains. Indeed, it is possible that improvements may still be made in circular saws that will bring it close alongside the band, in point of economy. Astonishing success has been achieved already in the use of thin saws, and who will venture to fix the limit beyond which improvement in this direction shall not go.—*The Timberman.*

THE NOISE OF THE FINGER.

Dr. Hammond says that when you place the end of your finger in your ear, the roaring noise you hear is the sound of the circulation in your finger, which is the fact, as anyone can demonstrate for himself by first putting his finger in his ears, and then stopping them up with other substances. Try it, and think what a wonderful machine your body is, that even the points of your fingers are such busy workshops that they roar like a small Niagara. The roaring is probably more than the noise of the circulation of the blood. It is the voice of all the vital processes together—the tearing down and building up processes that are always going forward in every living body from conception down to death.

THE CANADA

LUMBERMAN

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. Mortimer, Peterborough, Ont.

Terms of Subscription:

One copy, one year, in advance	$1 00
One copy, six months, in advance	0 50

Advertising Rates:

Per line, for one year	$0 75
Per line, for six months	40
Per line, for three months	25
Per line, for first insertion	10
Per line, for each subsequent insertion to 3 mo's.	04
Cards not occupying more than 12 lines (1 inch) per annum	8 00
Cards not occupying more than 12 lines (1 inch) for six months	5 00
Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & CO., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. OCTOBER 1, 1886.

IF you want a situation, or want to find a first class foreman, advertise your wants in the CANADA LUMBERMAN. Only one cent a word.

WE expect a great rush of subscriptions during the next few weeks, as a result of our low offer for the balance of the year. Send in your quarter.

WE desire to secure active agents in every county who are willing to work on liberal pay to take subscriptions for the CANADA LUMBERMAN. Outfits and sample copies free.

THE auction method for selling lumber, recently adopted in New York, does not appear to have gained popular favor. Sales of this nature have been almost entirely discontinued.

THE editor of the *American Builder* grows funny, and says:—The most afflicted part of the house is the window. It is always full of pains, and who has not seen more than one window blind?

THE railroads of the continent require nearly $15,000,000 worth of timber per year for ties alone—equal to the annual product of a strip of woodland 400 feet in width alongside every mile of track.

MANUFACTURING interests in the Dominion show a steady and rapid increase. Lately compiled statistics prove that the total number of factories has risen from 843 in 1878 to 2,135 in 1886. The amount of capital invested in these undertakings has increased from $37,819,731 to $67,293,373, and the value of the products from $39,963,282 to $102,870,166 during the same period.

FROM the next issue the LUMBERMAN will be enlarged and materially improved in every way. Neither the typographical appearance or the arrangement of matter in this issue is up to what we intend making it in the future. Hurry is something which should never be permitted in a printing office, but unfortunately such has been necessary in turning out the present number.

WHAT is stated to be the widest leather belting ever made in Canada, is now in process of construction by the widely known leather belting manufacturers, Messrs. Robin & Sadler, of Toronto and Montreal. It is for the Royal Electric Co., of Montreal, and it is to be used at their lighting station in that city to transfer the power to dynamos. The belt is 111 feet long, 38 inches wide, and double thickness.

DESIRING to make the CANADA LUMBERMAN a medium for the diffusion of information relating to the lumber and wood-working industries, we cordially invite communications on all relevant topics. Not only do we desire to secure all the news from month to month from all sources within the scope of this paper, but we also invite free use of our correspondence page for the discussion and ventilation of any subject likely to be of interest to the lumbering and wood-working fraternity.

COLONEL JEFFERS of East Saginaw, has bought from certain persons in Canada 500 000 acres, or twenty townships, of standing white pine. The land is situated on the Georgian Bay and upon the Serpent, Spanish and Mississaque Rivers. Colonel Jeffers, writes:—I have been engaged for most of my life in the business of buying pine, and think that nothing outside of the Saginaw Valley was ever seen like this whole Georgian Bay country for good pine. It is far superior to the Wisconsin or Lake Superior pine.

TO JANUARY, 1887.

FOR the balance of the year we will send one copy of the CANADA LUMBERMAN to any one sending us 25 cents. To new subscribers who will send us $1 we will mail the LUMBERMAN from now until the 1st of January, 1888. Every lumberman, saw-mill owner and wood-worker in the Dominion should accept this very liberal offer. As this is the only journal of the kind in Canada, and as we propose making it a thoroughly representative organ for the lumber and wood-working industries none can afford to do without it. Send us your money, and receive in return a paper which will keep you acquainted with the ins and outs of the trade, and especially a complete market report.

EXCHANGE ECHOES.

Contemporary Opinions on the Various Matters of Interest to the Trade,

Northwestern Lumberman.

We are told by the manufacturers of machinery that their business has picked up wonderfully of late. The dullness that prevailed in the shops in the early summer months has disappeared, and in its place has come activity. One gentleman says that his shops are overrun with orders, and that the outlook is very promising. Another gentleman visited a section of country not particularly noted in lumber circles, and brought back $40,000 worth of orders; and there will be more to follow. There is without question, a growing feeling of confidence among lumber dealers and manufacturers.

Monetary Times.

Circular advertising is getting to be a terrible nuisance to many firms. About half of their mail is made up of envelopes containing circulars. The experienced eye can now detect these as soon as seen, and they go into the waste basket unnoticed. Business men now a-days cannot spare the time to wade through long-winded circulars. If you have anything to sell say so by means of a judiciously worded and attractively displayed advertisement in a live newspaper. It is cheaper and is more likely to command attention than the most elaborate circular.

Southern Lumberman.

MORE people go crazy on the subject of sawdust than in regard to anything else of the same utility, and more cranky suggestions have been made for its use for more varied purposes than any other refuse and waste incident to the wood-working trades. A German gentleman named Fredrick William Wendenburg, of Bagenz, Prussia, has made application to the government of Canada for a patent for a process of manufacturing cattle feed from sawdust or wood meal and other materials, and also to have patented the use, application and employment of the same in Canada. We suppose cows kept on this food will be expected to yield a fine article of pyroligneous acid and wood alcohol milk and make large yields of oleomargarine butter. When the fool killer comes and does his whole duty we will hear less mention of sawdust.

Southern Lumberman.

NONE of the various log rule tables give any satisfactory method of measuring a hollow log. A very interesting discussion on this subject occurred the other day on a proposed trade for a large lot of standing poplar timber in Giles county, Tennessee. All the terms of the trade were agreed upon except in regard to the timber that should prove to be hollow. The seller proposed to deduct the square of the hollow from the amount of lumber the log would make if sound, and the buyer proposed to deduct one-half the diameter of the hollow from the diameter of the log. For instance, he proposed to count a 24-inch log that had a four inch hollow in it as a 22-inch log. No agreement was arrived at, and our opinion was asked. We would be glad to hear from lumbermen, and learn what the custom is in measuring hollow logs in every locality. Write to us on the subject.

Northwestern Lumberman.

The Duluth lumbermen have a scheme for getting around the difficulty of running logs down the wild St. Louis river. The proposition is to establish the Union Boom works near the mouth of Cloquet river, and secure rail connection between that point and the mills at Duluth, by which to bring logs down from above the rapids. This looks like a feasible undertaking, and one that could be carried out if sufficient capital and energy are employed. It is evident that much of the lumber from the Duluth district can be profitably marketed in the lake cities and at the east. The tendency of a large portion of the mill output at Duluth is already eastward. It certainly seems as if it would pay the owners of stumpage on the St. Louis to provide a means for bringing logs to the mills at Duluth, from whence a choice of markets in all directions can be had.

Southern Lumberman.

The Canadian government wants reciprocity, in other words, free trade, in lumber with the United States, and has placed an export duty of $3 per thousand on pine logs and $2 on spruce logs in retaliation for an import duty levied on Canadian lumber by the United States. Some Michigan lumbermen have made heavy purchases of Canadian timber lands, and from these conditions several question more or less affecting various lumber interests have arisen among our northern contemporaries. Difference of opinion prevails. Whether free trade will have a tendency to protect American forests; whether it will lower the price of American lumber or merely advance the price of Canadian stumpage, are some of the questions discussed. It is a matter that does not affect the lumbermen of the South, and free trade or a high tariff on Canadian lumber are matters of no consequence to them. If we may be allowed to make a purely disinterested suggestion, we should say, that, without having made the question a study, it would be entirely safe to leave the subject severely alone and let it remain just where it is for a few years. Where one is in doubt what course to pursue, it is always safer to do—nothing.

Northwestern Lumberman.

The news from Washington the past week that Canada proposes to make the export duty on pine saw logs prohibitory has pricked up the ears of Canadian pine owners on this shore and they are a little uneasy. W. F. Whitney has just purchased 120,000,000 feet on a tributary of French river, and calculates to put in 8,000,000 feet of logs to be brought here; an Oscoda party proposed to operate quite extensively in long timber in the Georgian Bay region and raft the same to Oscoda to be sawed; the Emery Lumber Company expects to put in 15,000,000 feet this winter to be brought over next season, and two or three Alpena parties proposed to operate extensively and raft the stock to Alpena. If the export duty is made prohibitory it will at once be seen that it will materially affect the calculations of these parties, as it will compel them to either suspend operations or build mills in Canada, as well as curtailing intended supply of mills on this side. The Emery Lumber Company wants its stock to supply its mills at East Tawas and Saginaw, but its timber lies along the line of the Canadian Pacific railroad, and it will possibly be forced to build a mill and manufacture there, and then there is a duty of $2 a thousand on lumber imported into the United States. The Canadian people are determined to derive the benefit arising from the manufacture of the commodity, and the desire is natural.

American Builder.

The planing mill men and other wood workers of Cleveland, have been very greatly interested during the past ten days or two weeks, over one of the simplest and yet most wonderful machines ever set up. It is the Cyclone Dust Collector that has been steadily at work in Smeed & Co's. box factory. It is, as all who see it admit, a final and complete solution of that problem that has been the one great source of trouble, viz., how to send the wind in one direction and the shavings and dust in the other, after the fan has blown them to the shaving room or other place of deposit. The Cyclone Collector does it to a charm. The steam is blown into it, and while the shavings and dust are so quietly dropped that the fireman can feed from the room with the doors open all day long, the blast is carried away through an opening in the top, and nothing else goes with it. It is difficult to make one believe that the machine will do what it does, yet the hundreds who have visited it are limited to a man in witness to the fact that it *does* it, and that too, all day long without a halt or a break. Several others have been ordered, and will be set to work in Cleveland as soon as they can be manufactured.

AN ADVENTUROUS VOYAGE.

The *Mary Graham*, a barque hailing from Quebec, laden with timber, has had an adventurous voyage. She has brought with her the *Ocean*, a Norweigian boat, which left Norway in May, with two men on board, with the idea of crossing the Atlantic. The *Mary Graham* picked her up 270 miles from land off the banks of Newfoundland, after being six days at sea. She measures 5 ft. 6 in. in breadth and about 14 ft. in length. Three days after the rescue the *Mary Graham* was running before a hurricane and shipped a tremendous sea, which carried away all her boats, smashed in the front of her cabin, and cleared out its contents, spoiling all the provisions but a few tinned things. The captain was killed, and the second officer, with one man, was washed overboard. Most of the crew were severely injured, one man having his leg broken and another his arms. The deckload of timber was washed overboard.

THE BIG TIMBER RAFT.

The work of repairing the broken cradle of the big timber raft, at Joggings, N. S., is being vigorously pushed, and from fifty to seventy-five men are engaged in the work. It is expected that a successful launch will be made in a few days. As before described in these columns, the raft is 410 feet long, 50 feet wide, 35 feet high, and contains 2,250,000 feet of lumber. The earth has been cleared away from beneath the huge structure sufficiently to admit new launchways and supporting timbers. Narrow trenches are dug across in which the bed-timbers are placed that support the shores and bilge-timbers Afterwards, the intermediate section of earth and the launchways and crushed timbers are removed, the pressure upon them being relieved by the means of hydraulic jacks. Should the raft be safely launched and towed to its destination at New York, it will doubtless be the finest display of spruce timber ever seen in an American metropolitan market.

SALUTATORY.

WITH the present issue we are called upon to assume the onerous duties connected with the editorial and business management of the CANADA LUMBERMAN. Whether or not we have mistaken our "calling" is a matter which time only and the readers of this paper can determine. We start out, however, in the hope that our past experience in trade journalism may fit us for the work we have undertaken, and that by a careful and practical study of the wants of the trade, we may from month to month fill the pages of the LUMBERMAN with matter best calculated to interest all those from whom this journal seeks recognition and support.

The LUMBERMAN has a broad field to cover, and it will be our endeavor to do equal justice not only to the lumbering, but woodworking industries as well. The news of the trade will be presented in a concise and readable form. Special attention will be given to reports from the various wholesale lumber markets throughout the world, together with reliable prices current. Editorially the affairs relating to the industries represented will be treated with all fairness and candor, in justice to all and with malice towards none.

Among the miscellaneous reading of the paper will be found from time to time valuable articles on technical questions pertinent to the lumbering and woodworking industries. This department is intended alike for the employer and employed, and will assist in disseminating the views of some of the best writers and thinkers on all practical questions.

Communications upon any subject in which the trade is interested are earnestly solicited. The columns of the LUMBERMAN are always open for the fair discussion of any subject in which its readers are concerned. Anyone desirous of expressing his views on any subject connected with the lumber and woodworking industries is at liberty to use these columns.

Our "Personal" department, and "Sketches of leading lumbermen," which we propose introducing in a future issue, will be found of considerable interest. We shall at all times be thankful for contributions from the trade containing personal notes, items of news, or information of any character.

In conclusion we would solicit the hearty co-operation of all interested in the branches of trade of which this journal seeks recognition, for its future success, and we shall do our best to please all.

A. G. MORTIMER.

THE *Journal of Commerce*, Montreal, says of the Ottawa, Ont., lumber business that there is thought to be a prospect of trade looking up, and that its condition now is better than it was a year ago. The deal trade with Quebec is improving, but the export demand is otherwise light. Next year's stock, it is believed, will not exceed that of 1886, and probably less square timber will be gotten out, the market being already glutted with that kind of stock. Wages for woodsmen are about the same as last year, choppers getting $20 to $22 per month, and other laborers $15 to $23.

THE Toronto *Globe* of recent date says that the agreement which was entered into a few months ago between the general freight agents and the lumbermen, by which all lumber shipped should be taken at an estimated weight, has fallen through. The lumbermen were dissatisfied with the arrangements, and on Thursday the old order of things was reverted to. All lumber will be weighed in Toronto in the same way as other freight. The lumbermen want lumber carried at so much per thousand, but as lumber varies so greatly in weight, the railway companies will not agree to this.

UNITED STATES Commercial Agent Hotchkiss, in the course of an exhaustive report to Secretary of State Bayard upon the lumber industry of Canada, says that while the increased export duty upon saw logs is published as being from $1 to $2 per 1,000 feet, board measure, it is evidently intended that when the exports become developed the duty shall be further increased to $3, under the discretionary power vested in the Governor-General, which rate, it is supposed, will be prohibitory. "It is an indisputable fact," he says, "that this tariff will also be further increased if it shall become necessary to find the prohibitory point; for while the Government interposes no objections to Americans owning the timber, it is fixed in its determination that the Dominion shall have the resultant benefits arising from the manufacture."

THE Lumber Manufacturers' Association began its annual convention in Chicago on Sept. 23rd. President A. G. Van Shaack in his address said the lumber trade since 1884 had been less profitable than it should have been. The quantity of pine lumber that will be placed in the market in 1886, he said, "is estimated at about seven billion feet, which, if correct, is evidence that the manufacturers of pine lumber, who now receive only the current price of 1880 for their product, donate to the consumers of their lumber all the advance in timber since 1880, in amount say $14,000,000 for 1886." The timber supply of the Northwest, he said, is far too small for the prospective demand. Secretary Hotchkiss said in his report that if the estimates supplied by individuals were correct, the lumber producing regions of the Northwest had a hung-up stock of from one and a quarter to one and a half billion feet of logs on the first of the present month.

THE office of the LUMBERMAN is in connection with the *Review* Printing and Publishing Company, George street, Peterborough.

PERSONAL.

[Contribution from or concerning our friends and patrons are freely welcome to this column. The name of the sender must always accompany such notices.]

Mr. J. J. Taylor, for some years past associated with the firm of J. C. Wilson & Co., Picton, Ont., has ensconsed himself into the manager's chair of the Rathbun Co.'s Agency at Napanee. Mr. Taylor is an obliging and courteous business man, and is pretty sure of making the Napanee Agency as great a success as it has been in the past.

Mr. James Breault has entered on duties in the Central Office of the Rathbun Company succeeding Mr. Wm. Deans, who has been promoted to the position of assistant to Mr. Rixen.

Mr. J. B. Miller, President of the Parry Sound Lumber Company, has removed his family to Toronto, where he intends to reside during the winter months.

Mr. W. C. Archer, who has during the past two years been connected with the stenographic staff of the Central Office of the Rathbun Company, left on Monday for British Columbia, where he makes his future home. Mr Archer made a host of friends when in Deseronto, and he departs with the best wishes of all. We wish him all success in the far west.—*Deseronto Tribune.*

We congratulate brother Dan. W. Baird, of the *Southern Lumberman*, Nashville, Tenn., on his able essay on the subject of "Class Journalism and Trade Papers," read before the Tennessee Press Association at its late annual meeting. Our thanks are due Mr. Baird for complete minutes of the convention.

PROCESS TO TOUGHEN WOOD.

It is claimed that by a new process white wood can be made so tough as to require a cold chisel to split it. An exchange says: This result is obtained by steaming the timber and submitting it to end pressure, technically "upsetting it," thus compressing the cells and fibres into one compact mass. It is the opinion of those who have experimented with the process, that wood can be compressed seventy-five per cent., and that some timber which is now considered unfit for use in such work as carriage building could be made valuable by this means.

THE LUMBER AND WOOD WORKING INDUSTRIES OF BROCKVILLE.

A representative of the *Lumberman* recently paid a visit to the beautifully situated town of Brockville, and while there visited the various lumbering and wood-working establishments of which that town boasts. From his note book the following information is taken.

KEARNS & MARSHALL—LUMBER.

Perhaps the largest wholesale and retail dealers in Lumber throughout this section is the old established firm of Kearns & Marshall. Having been in business here for the past 14 years, these gentlemen have built up a trade of which they justly feel proud. The yards and business office of the firm are situated on the main street, near the centre of the town, and occupy a space of 175 x 300 feet. The stock usually kept on hand here consists of about one million feet of lumber, together with large quantities of laths, shingles, fence posts and hop poles. Across the St. Lawrence river, in the village of Morristown, N. Y., we also find this firm operating a saw mill, with a capacity for turning out 15 000 feet of lumber daily, in addition to 10,000 to 14 000 shingles. The lumber yard at this point is much larger than the one previously referred to, there being in stock two and a half million feet of lumber. The trade done by Messrs. Kearns & Marshall is principally local, although considerable stock is annually shipped to the New England states. This business foots up to from $10 000 to $12,000 per month, and gives employment to 20 men.

PETER MCLAREN—LUMBER

Opposition, it is said, is the life of trade, and evidently this was the impression formed by Mr. Peter McLaren, when he opened out his extensive yards here two years ago. Being kindly received by Mr. Jno. Peverley, manager, and his assistants, Messrs. T. B. Moore and C. H. Storey, we took a tour of inspection through the various buildings and yards, which are stocked "mountains high" with every description of sawn and dressed lumber, laths, shingles, dressed sheeting, carpenters' lumber, flooring, roofing, scantling, sash, doors, mouldings, etc., etc. This is simply a branch of Mr. McLaren's extensive works, and the stock usually kept here is intended for local consumption only. The extensive saw mills operated by this well-known lumberman, are situated at Carleton Place and Mississippi, Ont., from which forty-five to fifty million feet of sawen lumber is annually produced. The manufacture of square timber is even more extensive. The principal shipments of lumber from these mills are to New York, Portland, Boston, and other American cities, while the square timber is nearly all shipped *via* Quebec to European ports. The following figures indicate the ruling prices in Brockville during the past two months; Lath, No. 1, $2; No. 2, $1 75; Shingles, 18 in, $1 25, $2 and $3; cull lumber, from $6 to $8; shipping cull, from $12 to $14; siding, from $15 to $18; bill timber (hemlock), $12 to $14; pine timber, $17 to $20.

MCNISH & MCKENZIE—LUMBER.

This firm have also been doing business in Brockville for the past two years, and although carrying on but a small trade compared with the firms mentioned above are nevertheless holding their own. The lumber on sale at the yards here is manufactured at the firm's saw mill at Algonquin, Ont. The capacity of this mill is about 7 000 feet per day. The manufacture of shingles, cheese and all kinds of packing boxes is also carried on. They also operate a small custom flour mill for the accommodation of farmers and whatever money they can make out of it. Mr. McNish attends to the business at the mill, and Mr. McKenzie has his head quarters at Brockville.

JNO. BRIGGS & SON—PLANING MILL.

Wood-working establishments always go hand in-hand with lumber as we find it in its rough state. From the log comes the lumber, and from lumber comes every variety of necessary and useful article for all branches of trade. The planing mill operated by the above firm has been running for the past 17 years, and does a full share of the trade of the town. The manufacture consists of sash, doors, blinds, mouldings, and, in fact, all kinds of house furnishings. The mill gives employment to an average of 16 hands. The best Canadian machinery is employed, and is contained in a building 35 x 65 feet, two stories high, with engine and boiler room adjoining.

KEARNS & CO.—PLAINING MILL.

The above firm are engaged in the manufacture of the same class of goods as the one just described, and have large premises situated in the centre of the town. This business has been established since 1874, but has only been controled by the present firm during the past two years. The main building is 40 x 60 feet in size, and stands three stories high. Near at hand are also two large sheds, used for the storage of lumber. The list of machinery used in the mill is complete and of the best Canadian manufacture. A considerable number of hands are employed.

The extensive building operations which have been going on in Brockville for the past year or two, have taxed the capacity of these mills to a considerable extent. Everything considered the lumber and wood-working industries of Brockville are in a prosperous condition.

General News Notes.

COUNTRY shingle mills do not appear to be making much money this year.

MCLENNAN'S mill at Kilworthy has cut 15,000,000 feet since the season began.

JOSEPH SONA, of Deseronto, had some of his fingers lacerated by a saw a few days ago.

THREE million feet of lumber will be required for the new Canadian Pacific elevator at Montreal.

W. A. HUNGERFORD has bought the mills situated at Glen Lewis, formerly owned by C. Wallbridge.

THE opening of the Murray Canal will be celebrated by a grand demonstration at Trenton or vicinity on Oct. 2nd.

SHIPPING at Ottawa still continues brisk in the lumber trade, and shows every sign of remaining so until the close of the season.

THE new forty cord brick kiln for burning charcoal at the Rathbun Co's works at Deseronto, is now completed. It is said to be a fine piece of workmanship.

THE Gilmour Company and the town of Trenton are at loggerheads concerning a water privilege asked for by the above firm.

GEO. GRAY'S sash and door factory at Harriston, Ont., was destroyed by fire on Aug 29th. Loss partly covered by insurance.

ALL the Chandiere and Hull mills, on the Ottawa, Can., are running night and day in expectancy of a brisk fall demand.

IN the Ottawa district large numbers of shantymen are already being engaged to go to the bush to engage in lumber operations for next season.

ABOUT 1,000 railway ties and 1,200 posts are turned out of the Cedar Mill, at Deseronto, each day, besides shingles and dimension stuff.

ADVICES from Vancouver, B. C., state that the ship Beaconsfield is loading with 1,020,000 feet of lumber, value $11,800, for Peru, and the barque Nanimo is taking 465,000 feet to Tientsin, China.

BELLEVILLE was visited with a disasterous fire a fortnight ago, by which about 2,000,000 feet of lumber in Flint & Holton's lumber yard was burned. Loss, $25,000; no insurance.

THE barge which was fitted up by Gilchrist & Co., of Alpena, Mich., to take over logs from the Georgian Bay, after having made one trip abandoned the project.

THE Rathbun Co., of Deseronto, has closed a contract with the Grand Trunk Railway Co., for 300,000 railway ties to be delivered during the coming fall and winter.

The Dickson Company, of Peterborough, have constructed along the river bank at their property about seven hundred feet of piers this year, to protect the shores, and behind which to deposit mill refuse and thus make ground.

IT is claimed that cedar on Manitoulin island, Lake Huron, is getting low. Lately a propeller had to move from port to port along the shore of the island in order to get a full load for Chicago.

THE steamship Cameo lately sailed from Montreal with 1,781,000 feet of lumber on board, shipped by Bryant, Powis & Bryaut, London. It was said to have been the largest cargo of lumber loaded in the St. Lawrence this season.

A GIANT oak weighing about 55 tons has been recovered from the bed of the Rhine, where it is supposed to have laid at least 3,000 years, and is on exhibition on a kind of Noah's Ark moored off the Cours-la-Rhine, Paris.

To find the amount of water required for a condenser divide 1,100 by the difference between the temperature of the hot well and that of the injection water; the result is the number of pounds of water required to condense one pound of steam.

IF it is decided to maintain the Colonial Exhibition permanently in England it is, according to the *Manitoban*, probable that the Manitoba Government will have a space reserved for the products of that province. The land department of the M. & N. W. Railway may also have a permanent space.

THE Northwestern Coal & Navigation Co., has offered to make a free grant of land and ten thousand feet of lumber for the erection of a hospital in Lethbridge, Man., provided that the residents will furnish the labor and other incidental expenses necessary to its erection.

FOREST protection has awakened so much interest in California that the legislature, at its last session, appointed a forestry commission, with instructions to investigate the extent character and rate of destruction of the timbered districts of the state.

AN Ottawa paper says:—"Less square timber than ever before has passed through the Chaudiere Slides this season. A large quantity has been taken over the Cadadian Pacific Railway from Nipissing to Papineauville. This, combined with a smaller cut than usual, accounts for the small traffic through the Slides."

THE local news columns of the *Record*, at Selkirk, Man., show that there is a considerable fleet of steamers and barges on Lake Winnipeg, all largely engaged in the lumber trade between the mills located on that water and Selkirk Apparently there has been an increase in the Lake Winnipeg traffic this season over former years.

MESSRS. SMITH, WADE & CO., timber merchants here, are dissolving partnership at the end of the season, Mr. Smith retiring. It is understood that Mr. Wade, with Mr. Walcot, now with Messrs. J. Burstall & Co., will continue the business of the firm of Messrs. Smith, Wade & Co., which will be represented in Canada by Mr. Wade and in England by Mr. Walcot.

A RECENT letter from a correspondent at the Indian and Colonial Exhibition, says that there have been further enquiries for white oak staves, this time from Spain. The last enquiry was followed by a purchase on account of a New Orleans wine cask manufacturer. Mr. H. F. Coombs, of the Canadian section, has offered to supply all needed information on the subject.

AN oak stain can be produced by mixing powdered ochre, Venetian red and umber in size, in proportions to suit; or richer stain may be made with raw sienna, burnt sienna alone is very effective. To darken oak, strong coffee is sometimes used. To make it very dark, iron filings with a little sulphuric acid and water put on with a sponge and allowed to dry after each application, is good.

THE cut of square timber on the Ottawa, Can., has considerably fallen off of late, owing to the increased demand in Great Britain for sawed stock in preference to that in square form. A less quantity of square timber than ever before has passed through the Chandiere slides this season, but the Canadian Pacific has taken large quantities from Nipiscing to Papineauville, where the sticks are put in the water and floated to Quebec.

GRADING on the Deluth & Manitoba railroad between the Northern Pacific junction and Red Lake Falls, Minn., is about completed, and track laying is in rapid progress. The line between Red Lake Falls and Grand Forks, on Red River of the North, is under contract. Red Lake Falls promises to become an important mill point, since the Red Lake pine region is tributary by way of Red Lake and Clearwater rivers. The new road will furnish a shipping outlet for sawed product, east, south and west.

THERE is a change in the firm of Bewick Comstock & Co., of Alpena. Charles Bewick has retired from the firm, having sold his entire interest in the bank, the lumbering business here, as well as the pin lands of Canada and Mississippi, to A. W, W. B. and J. B. Comstock, who will hereafter carry on the business.

THE Bow River Lumber & Land Company, composed of a wealthy syndicate of Eau Claire, and whose scenes of operations is at Calgary Northwestern Territory, are rushing the work on their new saw mill along with all possible speed. This will be the first saw and plaining mill introduced in that section, and will have a manufacturing capacity of 125,000 feet of lumber per day. A battery of three boilers and the frame work for a gang saw for the mills is in course of construction in Saginaw.

THE prevailing wages for shanty hands now being engaged at Ottawa are as follows:—Choppers, $18 to $20 per month; road cutters $14 to $17 per month; shanty foremen, $36 to $40 per month; shanty cooks, $36 per month.

In consequence of an arrangement between the Canadian Pacific railway management and the lumber firms in the Nippissing valley, Ont., in regard to transportation rates, two large mills will soon be built at McLeod's Bay, near Sturgeon Falls.

A BRITISH COLUMBIA paper says: "Some fine sticks were cut yesterday at the Hastings mill, Vancouver, one of them measuring 100x24 feet square, and weighing nine tons. The logs are free from all knots and imperfection, no better ones having ever been turned out at any mill on this coast.

THE Lethbridge (Alberta, N. W. T.,) *News*, says:—The Company's sawmill is now getting out 15,000 feet of lumber per day and about 4,500 logs are on the bottom in the vicinity of the mill all ready for the saw. This is only about one third of the logs which came down on the drive this spring.

THE rain of the past few days has caused the Montmorency River, Quebec, to rise sufficiently to permit of the driving of the logs which have been stuck all summer, to the mills. This will be a boon to working class of the district who have been out of work for the last six weeks. The rain has had the same beneficial effect on the Chaudiere.

"LAYIN' eout another railroad?" "Surveying for one," was the reply. "Goin' threw my barn?" "Don't see how we can avoid." "Wall now, mister, I calkerlate I've got somethin' tew say 'bout that. I want you to understan' that I got somethin' else tew dew besides running out tew open and shet them doors every time a train wants to go threw."

IT is expected that the cut of logs in the Upper Ottawa country next season will be very large Messrs. Lord & Hurdman have twelve shanties in the bush, and other firms are proportionately well represented. The wages paid lumbermen are good. There are 20,000 logs in the Des Joachim boom, which when passed through will finish operations there for this season.

THE Canadian government has made another increase in the export duty of logs. The tariff on pine logs has been placed at $3 a thousand and on spruce $2 a thousand. On shingle bolts a specific duty of $1.50 a cord has been declared. This will interfere with the operations of the Michigan men, who have recently invested largely in timber limits on the north shore of Lake Huron.

THE Canadian lumbermen are not satisfied with the export duty on pine logs and have renewed their demand for its increase to $3 per thousand feet. The original tariff resolutions brought down by the finance minister at the last session made the duty $3, but it was afterwards reduced to $2. Manufacturers of sawn lumber say that $3 per thousand export duty on logs is not more than equivalent to $2 per thousand import duty imposed upon lumber by the United States government.

A DEALER who had been scurrying around in the Saginaw valley, called at the *Northwestern Lumberman* office recently and had something to say about the tricks of manufacturers "They have been charging all the schemes in the catalogue to the jobber, but now they are onto them themselves. Over in the valley it is amusing to notice how lumber is piled. The best edge of the board is piled out. Unless a man gets down in the pile, or behind it, he knows no more than the man in the moon what kind of lumber it contains. And on that account there are eastern buyers who have had it set to 'em finely. The face of the pile looked well; seeing is believing, they think, so they buy; but in good time they found out that they could see about as far into a lumber pile as they can into a grindstone. I don't go on the face of a pile worth a cent any more." Wonder if the Chicago dealer expected the Saginaw valley manufacturers would order all the best stock put in the middle of the pile and the poorest outside. As they buy by inspection they get what they pay for.

THE *Journal of Commerce* is authority for the statement that the cut of square timber has fallen away of late, owing to the increased demand for sawn lumber in the old country in preference to the bulk block. A less quantity than ever in Ottawa's history has passed through the Chaudiere slides this season, the Canadian Pacific railway taking large quantities down by rail from Nippissing to Papineauville, where the logs are rafted and floated onwards by water to Quebec. There is not at all a large cut expected this year, and on account of the railroad facilities a very much smaller proportion than usual will pass through the Chaudiere slides.

MR. R. REEVES, head boiler-maker at the Wm. Hamilton Manufacturing Co, works, Peterborough, has returned from Waubashene, where he has been engaged in putting in the hugh boiler, made at the company's works, in the steamer Maganettawan, the property of the Georgian Bay Lumber Company. This boiler is the largest ever turned out of the Hamilton works. It is nine feet in diameter, twelve feet long, has one hundred and fourty-seven three inch tubes, has two corrugated furnaces forty inches in diameter, and weighs fourty four thousand pounds. Though made to carry one hundred pounds of steam, when tested by the Government Inspector, 160 cold water pressure was put on thus giving it a capacity of carrying one hundred and six pounds of steam.

ATTEMPTS have before now been made to utilize the water power of the falls of Niagara, but for some reason they have not been very successful. The new Manchester, which the imagination of its projuctor called into being, is far from being the scene of busy industry which he painted it. Now, a company has been formed with a capital of $3,000,000, for the purpose of making a great hydraulic tunnel, a mile and a half long, on the American side, at a distance of about 400 feet from the river. Enough power will be obtained to set in motion 240 mills of 500 horse-power each. In cheapness, it will be difficult to compete with this power. The company has already secured a fair proportion of the land necessary to carry on its operations. By the proposed utilization of this force, the great altar of nature will be left intact and not be defaced nor deformed.

COL. WALTER C. LARNED, the famous art connoisseur, has been in San Francisco for several weeks on a curious mission. He wishes to transplant to the handsome lawn of his magnificent summer residence, at Lake Forest, one of the big California trees, and he has just closed a contract with the Wells & Fargo Express Company to this effect. Special cars are to be constructed to transport the tree across the plains and the umbrageous leviathan will have to be drawn by horse power after the Missouri river has been reached, because the obstacles in the way of railroad curves and bridges east of that point cannot be overcome. The tree which Col. Larned has selected is somewhat over 300 feet in height, is 98 feet in circumference near the base, and weighs about 40,000 tons. The cost of transporting this monarch of the forests will exceed $18,000.

THE depression in the English timber trade, which has had so discouraging an effect on the American exporters during the season, still continues, and the London lumber journals of August 28 do not indicate that the cloud has lifted to any appreciable degree. Of the situation in London, *Timber* said: "The consumption, as evinced by the dock deliveries, drags onward with monotonous sluggishness, and the latest returns render it impossible to gathe eithes grounds for hope of better times or the reuerse." *The Timber Trades Journal* also presents a very lugubrious picture of the situation, particularly in London, and of Liverpool says: "The arrivals of wood-laden vessels have again been comparatively unimportant in number, when the season of the year is taken into consideration. A walk round the timber docks and the appearance of the quays and wharves at the various railway and canal companies reveals an amount of stagnation which it would otherwise be almost impossible to conceive when contrasted with the usual busy scene at this period of the import season."

General News Notes.

MAYOR WALKERS new saw mill at Kanauaskis, Calgary district, is in full operation.

MR. E. B. EDDY'S new sash factory at Hull will be ready for occupation in a short time.

THE Rathburn Co. are busily engaged establishing their shanties for the coming winter's work,

SOOT, SCOTT & Co., the Medonte Lumber Mills, Elsie, has cut 3,000,000 feet of lumber this season, and has 1,000,000 feet more to cut before the mill shuts down.

EXTENSIVE forest fires have been raging in the central and northern portions of Wisconsin. North of Milwaukee. Thousands of acres of valuable wood have been burned over.

GEO. GREY'S sash and door factory, at Harriston, Ont., was burned August 30th. Valuable machinery and a quantity of finished work was destroyed. The loss is heavy; partly insured.

LUMBERMEN get twenty cents a log at Wausaw, Wis., for raising "dead" or watersoaked logs from the bottom of the Wisconsin River. They have already raised about 600,000 feet and logs that have been dead for twenty years are said to be as sound as the day on which they were cut.

THE Ottawa *Journal* says that forest rangers are at present inspecting, on behalf of Messrs. J. R. Booth & Co., a tract of timber fifty miles square in the Nipissing district, with a view to its purchase. The owners of the limit, which is deemed a very valuable one, are Messrs. Barnet & McKay, and their price is $300,000.

THERE is said to be a small tree growing in a gulch near Tuscarora, Nevada, the foliage of which at certain seasons is said to be so luminous that it can be distinguished a mile away in the darkest night. In its season it emits sufficient light to enable a person to read the finest print. Its luminosity is said to be due to parasities.

UNITED STATES Marshal Crawford returned recently from an official visit to St. Mary's Lake, where he learned that citizens of the Canadian Northwest Territory are cutting timber on United States public lands by the wholesale, and are floating it down to Canadian territory, where it is cut into lumber, and sold to the residents of the North west Territory.

IT is understood, says the Port Hope *Times*, that the C. P. R. Co. and the lumber firms in the valley of the Nipissing are likely to agree on the subject of rates for transporting manufactured and unmanufactured lumber, and that upon the consummation of this most desirable arrangement, two superior saw mills will be erected in McLeod's Bay, near Sturgeon Falls.

IT is expected that the cut of logs in the Upper Ottawa country next season will be unusually large, says the Perth *Expositor*. Messrs. Lord & Hurdman have twelve shanties in the bush, and other firms are proportionately well represented. The wages paid lumbermen are good. There are 20,000 logs in the Des Joachim boom which, when passed through this week will finish operations there for this season.

ON Tuesday morning the 7th inst., Mr. Wm. Blashill, met with a serious accident at Saunders & McPherson's saw mill at Burk's Falls, in having his right hand caught against the edging saw, by which he loses a portion of all the fingers of that hand. Mr. Blashill, says the *Arrow*, is a very careful, sober, industrious man, highly respected, and he has the sympathy of the entire community. It will be a long time before he can resume his duties and then likely with difficulty.

MR. J. R. BOOTH, the well known lumberer and mill-owner, of Ottawa, has purchased a timber limit on the Temiscamingue some 75 miles in extent, from La Banque Nationale, for which he paid $77,500. Mr. Booth has made a number of purchases of limits recently. Every limit of any value that has been offered for sale of late has been readily disposed of, the mill-owners evidently realizing that a day is coming when those who do not own limits will find it difficult to obtain logs to keep their mills running.

THE biggest load of saw-logs ever hauled over a road in Washington territory recently arrived at Seattle. There were eighteen logs ranging from 24 to 120 feet in length. The longest ones are intended for vessels, masts, and one has a diameter of thirty six inches and another forty eight inches in the middle. The latter contains 13,000 feet of lumber, and the total measurement is about 100,000 feet. Their gross weight is about 650,000 pounds, and they are to be shipped to the Atlantic coast.—*New York Tribune.*

COMMENTING on the sawdust nuisance, a Pembroke despatch tells how James Dempster, of Petewawa, was brought up before the police magistrate by fishery officer Grant, on the 1st instant, and was fined $20 and costs, making in all $24.45, for putting sawdust in Petewawa river. The O tawa *Citizen* adds: "It is a pity that the law under which this fine was inflicted could not be put into operation in this city. Then some other way of disposing of the sawdust than throwing it in the river would be found."

OTTAWA millowners were not so busy last fall, nor are they this, as they were in previous years, this they attribute to the increase of railway facilities. In old days people had to obtain the whole of their winter stock before the end of the fall, but now with the increased powers of transit, they can receive lumber by rail at any time. This means increased employment at the lumber yards during the winter. The trade is steady at unchanged prices. But little lumber is obtained in Ottawa, the output having been principally disposed of for the American market. The local demand is moderate.

ON Saturday last a gang of men numbering 27, passed through here for Messrs. McLachlin Bros.' limits on Pock Lake. Another gang op men for Mr. Moore will pass through to-day (Wednesday) for his limits on Byers' Creek. Mr. Ed. Elcome is "walking boss" on the Bonnechere this year for McLachlin Bros. Messrs. R. Reeves & Co. have entered into a contract with McLachlin Bros. to draw provisions to their different shanties on the Bonnechere and Madawaska rivers. The first consignment started from Cobden to day.—*Eganville Enterprise, Nov. 22nd.*

During the season of 1886 the Gatineau boom has been busier than ever, an immense number of pieces and logs having passed over the slide, The following are the number of pieces credited to some of the leading firms: McLaren and company 94,000, Boyle & McCracken 14,868, Edwards & Co.. 65,000, Posey, 1,500 cedars, Gilmour & Co, 9 677, Rathbone & Co. 19,367, Hamilton Bros. 68,507, giving a total amongst these firms of 272,919 pieces. This does not, however, give the entire work of the season. A large quantity of odds and ends still remain in the boom to be sorted out and claimed. Messrs. Rathbone & Co., too, have brought down a great number of ties, whilst Messrs. Whitly & Booth have the making of a large raft still on the Madawaska river, which is uncertain whether they will be able to run through this season. The above returns are entirely distinct from the Ottawa slides, over which timber is still arriving.

ONE hundred and two thousand shingles have been shipped from Puget Sound to Port Moody for shipment across the Canadian Pacific to the east. This is only the beginning of a future great trade between the Pacific and the Atlantic coasts. Cedar grows here in abundance, and the shingles cut from the lumber are the most substantial in the world, tests having proved that, placed on tops of buildings, they can withstand the rain and tempests beating down upon them for 40 years. The shingles will not rot; the action of the weather wears them away, but decay never attacks them. Our eastern friends speaks highly of the shingles turned out on this coast, and the first shipment of them over the C. P. R. is the beginning of an immense trade. The forests of Cedar in the Atlantic States are well nigh exhausted, but in British Columbia there are such immense supplies that a century will pass away before all the trees will have fallen under the unerring aim of the axeman—*Vancouver News.*

CHIPPEWA FALLS, Wis., claims to possess the largest water saw mill in the world, and it stands pretty well up with the largest saw mill run by any power. The mammoth institution is owned and operated by the Chippewa Lumber & Boom Company, and furnishes employment to over 700 men. Its annual capacity is the enormous amount of 65,000,000 feet of lumber; 16,000,000 lath; and 16,000,000 shingles, and from 1,500 to 1,900 horse power is required to operate the numerous saws, etc. A remarkably large manufacture by this mill is reported. The record for the two weeks ending July 31 was 3,220,880 feet, and the total cut of the season up to Aug. 1 amounted to 22,468.-242 feet, or at the rate of nearly 270,000 feet per day. It is said that there is a 24 foot head of water at this point, and the lowest estimate of available horse-power is 80,000. The Chippewa River Improvement Company, the Chippewa Logging Company, the French Lumbering Company, the Mississippi River Logging Company, and the Chippewa Manufacturing Company have headquarters at Chippewa Falls, and the place contains two large flowering mills, plaining mills, etc.

THE thriving little village of Scotstown, Que., in the township of Hampden, Comton county, is situated on the Salmon river, and has about 500 inhabitants. It is a centre for lumber and has two lumber mills owned by Messrs. Parker & Jencks, which are at the present time running night and day, and giving employment to some eighty-five people. One of these, is a steam clapboard mill and turns out upward of 10,000 boards per day. They make thirty-one grades of clapboards, and ship mostly to Boston. The other is a water-power board mill and turns out 35,000 feet of lumber per day, which is shipped mostly to Portland. The Scotstown Chemical Pulp company have their mills here. Your correspondent through the kindness of Mr. Arkley, their manager, had the pleasure of a trip through the mills and witnessing the process of reducing wood to pulp, which was very interesting. These mills were erected in 1884 and are run night and day, and give employment to thirty-five persons. At present they turn out three tons of dry pulp per day, but the proprietors are increasing their capacity so that in the course of a month they will be able to turn out over twice the present quantity. The pulp from this mill has a nice long fibre, and is the finest your correspondent has ever seen. There are only two pulp mills in Canada doing a shipping trade, although some paper mills manufacture some of their own pulp. These three mills comprise the principal industries of the place. There are two churches, nine stores, a post-office and two good hotels in the village, and these have mostly grown fu during the past few years.—*Montreal Gazette.*

THE Peterborough *Review* scribe has been writing up the industries of Norwood, and has the following to say regarding the saw mill located there:—

Mr. S. H. Brown's saw mill is the only one inside the corporation. It is a lumber and shingle mill, and also contains machinery for planing and turning. Mr. Brown suffered from fire a few years ago. He now occupies a building 60x30 feet and two stories high. Steam power is used, a fifty horse power engine being enclosed in a detached brick building. There are in the mill seven different kinds of circular saws, a planer, matcher, lathe and rip and gig saws, etc. Mr. Brown has done a considerable business this year in sawing cedar paving blocks for Messrs. Van Vlack & Co., of Toronto the timber is procured in the vicinity of Norwood and is sawed at this mill. About 2,000 cords of the blocks have been sawn so far this season, and the prospects are favourable for a better season with them next year. Mr. Brown is preparing to erect another building, 20x50 feet and two stories high, which will be used for the planing and shingle mill. New machinery will be put in when it is completed, including a shaper, sticker and band saw.

ENGLISH TIMBER MARKET.

Messrs. A. F. & D. Mackay's timber circular of the 4th September, 1886, contains the following:—"Those who profess to be able to guage the reading of the barometer of trade and commerce believe that it indicates an improvement. This may be so; but it is manifest to those who are actually engaged in commerce, and have consequently a practical acquaintance with its working, that the improvement, if there be any, is of a slight character. Still the smallest reft in the dark cloud of depression that has so long overshadowed trade will be gladly welcomed as a happy omen of the revival so long hoped for. In this respect the timber trade will form no exception. There would seem, from the statistics of consumption as if there was a tendency of an increased demand among the actual users and consumers of timber. The consumption of Quebec square pine in the last month was 205,000 feet, as against 264,000 in the corresponding month of 1885; New Brunswick spruce and pine deals: 1885, import, 12,051 stds; stock, 16,522; consumption, 7,678; 1886, import, 9,050; stock, 14,133; consumption, 9,307."

GLUEING.

A furniture journal says: Experienced woodworkers have always contended thata glue joint properly done, is stronger than the wood itself. And yet joints often give way at the surface where the glue is used, which is accounted for by bad material. A similar reason is frequently the true cause, which few artisans wish to acknowledge. It is merely that skill is lacking. In glueing wood, it is asserted by competent authority, that bad work is produced by applying glue to both surfaces. A good job is secured by applying the glue hot, but not extremely so, to one surface, which should be cold, while the other surface should be heated at the stove, but should have no glue upon it. By this method the glue will permeate the wood and bind the surfaces together firmer than nature binds the fibers. It is said by good cabinet makers that if these precautions are taken, less difficulty will be found with glues which skillfully handled, usually will do the work reduired of them.

THE AMOUNT OF SPACE STEAM OCCUPIES AS COMPARED WITH WATER.

Steam, as compared with water, occupies 1728 times as much space. A cubic inch of water will make 1728 cubic inches of steam at atmospheric pressure. Now, if this steam is compressed into half the space it occupies at atmospheric pressure, it will be double that pressure, or 15 pounds above the atmosphere; it will then occupy only 864 cubic inches. If reduced again to half its volume it will occupy 432 cubic inches, and will have 30 pounds pressure. Reduced again to half the volume the steam will occupy 216 cubic inches, and will have 60 pounds pressure to the square inch. We can go on reducing in this way until we find that a cubic inch of water turned into steam and compressed into a space of three cubic inches, will have the somewhat enormous pressure of 3840 pounds to the square inch.—*Boston Journal of Commerce.*

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. Patent Office, Sept. 14, 1886, is specially reported by Franklin H. Hough, Solicitor of American and Foreign Patents, 925 F street, N.W., Washington, D.C., who will furnish copies of patents for 25 cents each:—

349,143—Saw, G. N. Clemson, Middletown, N.Y.

349,180—Saw mills, feed-work for, B. E. Sergeant, Greensborough, N.C.

349,008 — Stump-extractor, G. Y. Smith and E. A. Charles, Cedar Rapids, Iowa.

10,765—Lathe for turning spirals, V. Merklen, New York, N.Y. Re-issue.

349,365—Saw-mill, circular, W. F. Parish, Minneapolis, Minn.

.49,601 — Saw-set, P. A. Potter, Wellsborough, Pa.

THE lumbering business at Sturgeon Falls, Ont., is commencing to boom again and promises to be brisker than ever this year.

Market Reports.

TORONTO.

From Our Own Correspondent.

SEPT. 9.—Our Industrial Exhibition being now in full swing, business has quieted down for the time being. Engine power being in demand for the conveyance of passengers and live stock, etc., lumber has to take a back seat for awhile. Trade has kept exceedingly good up to the present, and considerable lumber is now moving over our docks, having averaged during the past two weeks about one vessel cargo per day, the larger portion of which has not left the saw more than two months, and so far as I am aware, there is only one wholesale firm that have any dry lumber to place on the market, and that only in limited quantities. Figures at the yards keep the same, and there is no immediate prospect of any change in that respect. Although held more firmly by mill men, long bill stuff is about the only class of lumber having any money in it just now for the dealers, and manufacturers having a stock of long logs have a chance to realize well.

As predicted by me in a former letter, the new tariff adopted by the R. R. companies, in carrying lumber by the M, at estimated weights, has been of but short duration. Nothing more could have been anticipated as to the fate of so absurd a scheme. The carriage of lumber by weight is all right. It is the high rates charged per cwt. that is wrong, and which must eventually be lowered, if the coarser grades of lumber are to be brought to market and sold at a profit. If the R. R. companies can bring a car of lumber 100 miles for shipment to a foreign port for say $16.00, why should they charge $21.60 for a car intended to be used on the local market? It is not the former rate that is too low, but the latter that is too high, and such discrimination against a community having granted large bonuses to aid in the building of such roads, is a gross injustice which should not be tolerated, and could soon be altered if insisted upon by all who are interested. Let our Board of Trade take up this matter in a business-like spirit, and much more good might be done than by devising schemes to carry lumber by the M. Mill men and dealers alike are interested in this question. Green pine bill stuff and hemlock cannot be brought here and sold except at a loss under the present rates charged for freighting it, and it frequently becomes a question with the dealers as to accepting delivery of cars of green hemlock, or of letting the R. R. companies keep it for the freight, and it is useless to try and put a market value on this grade of lumber that it does not intrinsically possess. It can only be sold because it is of lower value than pine, and can therefore be sold in limited quantities.

SEPT. 24.—Our Industrial Exhibition being over business has returned to its normal condition once more. Our city as a whole has no doubt received a benefit by the influx of visitors during the period of the fair, but so far as the building and retail lumber trade is concerned, it is simply a week lost, not to be regained by any after exertion.

Shipments from our docks have gone on steadily—about six cargoes per week. Nearly all of this passes through the hands of Messrs. Christie Kerr & Co., either as owners or shippers, much the larger portion of which has consisted of 1 x 10 in. and 1 x 12 in. com. stocks. The amount of clear, picks and cut up coming forward is small as compared with the total amount being shipped. The reasons for this are two-fold: 1st, the danger to be apprehended from staining while in transit where not sufficiently dry; 2nd, the yearly decreasing yield of good lumber; 5 to 10 per cent. is now thought to be a fair yield, while a few years ago 40 to 50 per cent. clear and picks was frequently obtained from a stock. Such stocks will not again be cut in Ontario.

We now have plain sailing once more with the R. R. authorities, extremely little friction being observable between them and their customers, and so long as both endeavor to further each other's interests there will be but little to complain of. All that dealers require at the hands of the former now is, a lower freight on the inferior grades of wood, notably on hemlock, and the R. R. companies by taking this step will not lower their revenue by one dollar. Figures at the retail yards have, if anything, weakened, caused mainly by the return to the old tariff in R. R. freights. The rigid system of weighing in force for a time was not an unmixed evil, as it resulted in convincing the R. R. companies that their estimated weights on green, half dry and wholly dry lumber was above what it should have been, hence the more liberal usage now accorded to the shippers.

All the retail yards are carrying a fair stock, and sales from track side are good; dry 1 in. sidings and stocks are now difficult to obtain; long bill stuff is more plentiful, with prices lower. The supply of maple, elm, oak and ash is fully up to the demand. Only two or three firms here make a specialty of hardwoods, and therefore enjoy a monopoly in that line. Profits require to be large on this class of lumber, as the waste is large from various causes.

LONDON TRADE.

The lapse of a month seems to have produced the impression of a changed prospect, both in this as well as in most of the principal wood-markets of the country, and men speak hopefully, as they have not done for months, of the improvement which, like the rising sun as it begins to gild the distant horizon, is just visible to those whom restlessness or extreme interest prompts to take the earliest observations. Early risers at high elevations profit by the fact of their exalted position in being able to descry the first promise of the coming sunshine; but it not infrequently happens that, even while they herald the hopeful prospect to their less observant brethren in the valley, the clouds are gathering which may shut off the anticipated sunshine before it has surmounted the surrounding peaks and penetrated the lower regions which it was expected to fertilize. Such may, perhaps not inaptly, be taken to represent the position of the wood-market at this moment.

The opinions of those whose position in the trade qualifies them to make a statement, based on a bird's-eye view of the present situation, unanimously incline to the prospect of improvement later on, although the more cautious among them do not hesitate to imply the danger of failure, should any of the present conditions, upon which such expectations have been formulated, become hereafter reversed through misguided action on the part of those whose province it is to supply this market. It goes a long way in favor of the uninterrupted development of this prospect, however, that all markets coincide in the outlines of such presumptive improvement; but still, at the best, a rise in values cannot be described more favorably than as "potential," while it is very necessary to remember that, should the ratio of import to consumption be even slightly interfered with, or should the future increase in stock come in the shape of reckless consignments, there must occur a relapse which would plunge the market into greater straits than it was before the prospect of better times was announced. —*Timber, Sept. 18th.*

MONTREAL.

Some facts relating to the lumber trade of Montreal are furnished in a recent issue of the *Herald*: "The Montreal trade is almost altogether in deals and lumber. The deals are chiefly sent to Great Britain and the lumber to South America and the West Indies. The deals are pine, and the greater part of them come from the Ottawa district; a small proportion is brought from Michigan. The great bulk of the deals is conveyed by water in barges; very few, comparatively, are carried by rail. As many as 80,000,000 feet of deals were exported from the port last year, being one hundred per cent. more than the shipments of 1884. The exports of the current year will, before navigation closes, be considerably in excess of those of last year. Some idea of the importance to Montreal of this young and growing timber trade may be gathered from the fact that about fifty thousand dollars was paid last year for the labor connected with loading the deals. A considerable portion of the deals exported from Montreal is required for the match factories of Great Britain, where they are converted into matches and match boxes. Deals of all qualities are used for this purpose."

MONTREAL LUMBER MARKET.

MONTREAL, Sept. 25.—Quotations remain steady and unchanged, but the market is as has been fo some time past decidedly active, and a brisk demand has kept up a cheering business at the yards. The imports are quite extensive, and large quantities are continually arriving per barges via the Lachine Canal. The increase in trade for September is generally from 40 to 50 per cent in excess of that of the corresponding month of last year. It is a marked evidence of better times, to see so many buildings in course of erection in every quarter of the city, and the suburbs are not behind hand in this particular Orders continue to arrive freely from the country, and a good business is being done daily in carloads. The exports to date include 2,727,383 pieces deals, deal ends, boards and battens to Europe, and 13,156,400 feet of lumber to South America. Quotations for freights remain unchanged at 47s 6d. to 50s. per standard to the United Kingdom, and $11 to $12 per M. to the South American ports.

GLASGOW.

The *Timber Trades Journal* of the 18th Sept., says:—Arrivals here of Quebec pine deals per steam liners continue ample for the wants of the market; a cargo of same by a sailing vessel is also included in the past week's imports at Glasgow, though nearly all the deals imported from Quebec and Montreal to Glasgow are now brought per steamer. Deliveries from Yorkhill Yard have been pretty active lately; the amount for the past four weeks being about 70,000 pieces deals and planks.

At the public sale here on the 15th inst. an attractive catalogue was submitted, comprising an extensive assortment of Quebec pine deals, various qualities, also parcels of U.S. black walnut, &c. Transactions publicly in deals were few, the greater part of catalogue being withdrawn, as offers did not come up to exposers' figures; of the other goods in catalogue a portion was put up without reserve.

There have been no arrivals of pitch pine at Clyde ports since begining of August, and, as stocks are large, a cessation of imports for a time is desirable; the arrivals of pitch pine last year during six weeks from 1st August were eight cargoes.

The quantity of log timber imported from Quebec to Greenock is about a third under that of last year at corresponding date.

NEW BRUNSWICK.

ST. JOHN, Sept. 1st, 1886.

Since my last communication quite a number of vessels have come to this port, and the harbour at the present time is busier than it has been since the spring fleet was here. There is quite a number of vessels due, and, as the deckload law comes into operation on the 1st of October, there is a feeling among dealers to hold back, as there will likely be a local demand for deals in order to give vessels a full deckload and clear them previous to the 1st prox.

At this writing wood goods are dull enough, and certainly the reports from Great Britain are not such as to warrant us in expecting any immediate rise in the price of our staple commodity. Dimension deals, that is 7, 9 and 11 in., can be bought at 8 dols. per *m*, and all width specifications can be procured at 7.50 dols. per *m*. This price is not rumunerative to the seller, but even low as it is, and with the present depressed state of freights, the shipper cannot make any money with the English market as it is.—*London Timber Trades Journal.*

LIVERPOOL.

The business during the past week has been only of a limited description, and the quays and docks have had a very lifeless look about them. The import has been small, the chief items being a few cargoes of spruce deals, chiefly from St. John, N. B, but some of the vessels are of large size, their carrying capacity being six hundred standards and upwards. There is also a steamer just arrived with a cargo of pitch pine timber and planks. Some of the latter just landed appear to be of fine dimensions and excellent quality, and should readily find purchasers amongst contractors and builders.

There is a widely spread opinion that the steady improvement in trade in the manufacturing districts is likely to continue, and, should these anticipations be borne out, the effects will not be long before they are felt in our trade, though past experience has generally shown that it is one of the last to feel any upward movement.

PROVINCIAL FOREST AND PARK.

Mr. A. Kirkwood, in a letter addressed to Mr. Pardee, Commissioner of Crown Lands for Ontario, proposes to set apart for a provincial park and perpetual forest 330,000 acres of land and 60,000 acres of water. The declared object is "to set aside a forest reserve principally for the preservation and maintenance of the natural forest," and to protect "the head waters and tributaries of the Muskoka, Petewawa, Bonnechere and Madawaska rivers, wherein it shall be unlawful for any person to enter and cut timber for any private use, or disturb or destroy the fur-bearing animals." In this forest the wild animals are expected to be tamed and domesticated "to some extent, for use and profit." The preservation of these four streams in undiminished volume is pointed out as important to manufacturers. The lands which it is proposed to reserve have already been surveyed and comprise the townships of Coningsby, McLoughlan, Bishop, Freswick, Bower, the township south of Bower and east of Coningsby, Peck, the east part of Hunter and the southwest quarter of the township east of Bower. Here, within reasonable distance of civilization, Mr. Kirkwood proposes to establish "a national forest and park," to which he gives the name of "The Algonkin Forest and Park."

As the lands have been surveyed, full particulars of the character of the region is in possession of the government. The proposed selection, it may be taken for granted, contains much picturesque scenery, and would be found to be appropriate for the purposes designated as well as being easy of access. The lands are almost due north of Toronto, at a distance of about one hundred and fifty miles. A park formed there would be more central than one, for which a good site could easily be found, north of Lake Huron or Superior. A similar reservation might possibly follow north of one of these lakes, in course of time.

The proposal is one which will, we think recommend itself to public approbation, even in this money making age. Indeed, it is based chiefly on economic grounds. In carrying out the details some difficulties would be met. It would be hard to prevent the stealing of timber and harder still, perhaps impossible, to prevent the hunting of wild animals. Still, enough could be done to ensure the preservation of deer, which will otherwise dissappear before long. But in the perpetual forest would be the greatest value of the park. The timber harvest could be gathered as it matured, and the young trees left to attain the size that might be made the standard below which none should be cut. Precautions would have to be taken against the ravages of fire, to which the park would be specially liable from the numerous camp fires that would enliven its gloom.

One of the four rivers which have their sources within the limits of the proposed park, the Muskoka, flows into the Georgian Bay; the three others, the Petewawa, Bonnechere and Madawaska, empty into the Ottawa. The sources are near together; two of them, Island Lake, which starts the Muskoka, and Otter Slide Lake, the head of the Petewawa, are not half a mile apart. The height of each is over fourteen hundred feet (1,405 85-100) above the sea level.

Fish abounds in the waters, which include the great Opeongo lake. Here the momentary idler, snatching a short repose from exhausting business and toil, could amuse himself with fishing in the assurance that he would meet with fair success. The preservation of this forest would undoubtedly have an important influence on the rain-fall; its destruction would lessen precipitation and decrease the volume of the rivers.

As the author of the pamphlet is on the staff of the Crown Lands department, its publication is probably intended to feel the public pulse on the proposals made. The response can scarcely fail to be favorable. In any case an expression of public opinion will be evoked, and it will be useful as a guide to the government in making or refusing to make the proposal official.

The same kind of duty the Federal Government is going to perform, on a scale befitting the whole Dominion, amid the enchanting scenery of the Rocky Mountains, where nature displays herself on a colossal scale. The site of the new national park of the Dominion, now understood to be under survey, is in the neighborhood of Banff, on the Canadian Pacific. The prime condition of accessibility will therefore be secured. The two projects will, in some measure, mutually support one another; for, though each will be sustained on its own special grounds, the prime element of the national park is common to both.

NEW YORK LUMBER AUCTIONS.

Some time ago an institution was started in New York which had for its object the trial of a new plan of selling lumber—the auction method. The scheme appeared to flourish for a time, and the semi-monthly sales came to be looked upon in some quarters as noteworthy features of the market. A notice, however, lately sent out from this concern, by which its clients and customers were advised that the regular sales would be discontinued, and occasional sales substituted. The stock on hand being meanwhile advertised at private sale, would apparently indicate that the business done did not result satisfactorily. *The Timberman* of Chicago has heard rumours, heretofore, to the effect that the auction plan did not give entire satisfaction, at least to shippers. This may not be the reason the business has fallen into a decline, though it appears possible that such might be the case. Whatever may have been the direct cause of the failure of the scheme, its abandonment is not likely to prove a great detriment to the lumber business. Forced sales are not likely to lead to good results in any line of trade. They do not tend to a stable condition of values, nor to a generally satisfactory outcome for the owner of the property sold. When it is necessary to force goods upon the market, or for any reason a public sale is required, the auctioneer is a proper person to be employed, but in ordinary transactions, arising out of the natural course of business, the less resort that is had to the vicious and uncertain methods of which he stands as the representative, the better for all concerned. It may do very well for kinds of merchandise which are liable to a rapid depreciation unless promptly marketed; for such goods an auction mart, where they may be quickly got off at some price whenever they begin to show signs of slow sale in the regular way, may be the very thing. But lumber is an article of a different character. It is as staple as the stuff of which coins are minted. If it is not sold to-day, it will be no less in style, and no less valuable, intrinsically, to-morrow or next month or next year. There is no apparent necessity in this case for undue haste in selling, except when the holder is for some cause obliged to realize, and there are hardly enough of these to support a special auction for their accommodation. The result of the experiment referred to proves this, if nothing more.

NEW BRUNSWICK TIMBERS.

An endeavour is being made to introduce birch and maple staves into this country. The staves of this wood from New Brunswick are said to be highly suitable for vinegar casks, and Mr. H. F. Coombs, of St. John who is now over here, has a sample case made of these staves on view at his stall in the machinery court, Canadian section of the Colonial Exhibition. The casks of birch and maple are being used now by local dealers in Canada for the purpose mentioned, and are taking the place of oak, on account of their cheapness. The sample staves we inspected appeared to be every way suited for vinegar casks, the wood is close-grained and free from knots, besides being pliable and tough. We understand that this wood can be put on the market here in its converted state, at a much less price than oak. To those looking for cheap casks we recommend a visit to Mr. Coombs' stall, where they can inspect for themselves a sample vinegar cask of New Brunswick birch.

We also inspected some washtubs at Mr. Coombs' stall of New Brunswick cedar, which struck us as being a very useful wood to have over here. There is said to be any quantity available for shipment at Miramichi as well as St. John. A special tract composed of cedar has been opened by the Northern and Western Railway of Canada, constructed by Mr. Alexander Gibson, of Maryville, and Mr. J. P. Snowball, of Chatham. This wood is said to be practically indestructible, and is used for fence-posts and foundation timber, besides telegraph poles and railway sleepers. It is surprising that wood bearing all these attributes should have been so overlooked by consumers here.

Mr. Gibson has a very fine exhibit of this cedar in the ground near the agricultural trophy in the Canadian court, in the shape of shingles, and there seems to be no use to which it cannot be applied. For racing boats its extreme lightness makes it especially suitable, and some highly finished sailing canoes of this material are on view. Whilst speaking of Canadian wood products it may be interesting to mention the a peculiar feature of the forest growth throughout the Dominion, and very likely in other countries as well, is that timber lands burnt over, which prior to the destruction yielded hard woods, have regrown pine and *vice versa*. Our forest friend might give us some useful information on this point.—*Timber Trade Journal.*

ADVERTISEMENTS

Those wishing to BUY or SELL TIMBER LANDS, LUMBER or SECOND HAND MACHINERY will find THE CANADIAN LUMBERMAN an excellent medium in which to make known their wants. Advertisements of this character will be inserted at the low rate of 1 CENT A WORD, cash to accompany the order in every case. Address,

A. G. MORTIMER, Publisher,
Peterborough, Ont.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh. Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is pratically cured, and the permanency is unquestioned, as cures effected by him four years ago cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.*

RENEW YOUR

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, Because:

1st YOU CAN GET IT FROM

NOW UNTIL 1st JANUARY, 1888 for $1.

2—It is the only Newspaper published in the Dominion of Canada devoted to the Lumber and Wood-working Industries.

3.—It is devoted to the development and utilization of our forest wealth.

4.—It furnishes complete and reliable quotations of prices of Lumber in all the leading Markets.

5.—Its Columns are filled with interesting Reading Matter, valuable alike to the Land Owner, Manufacturer and Dealer.

6.—It costs only $1.00 per year to have it sent, post-paid, to any address in Canada, and no Land Owner, Lumber Dealer, Manufacturer or Individual in any way connected with Timber Industries, can afford to do without it.

TO ADVERTISERS

It has a circulation among Saw Mill Owners, Manufacturers, Lumber and Timber Dealers and all classes connected with the Timber Business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the Cheapest, Best, Most Reliable and only true medium for placing your goods and wares before the Saw Mill Men, and Lumber and Timber Dealers of the Dominion.

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.
General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.
MANAGER—WILLIAM SMITH.
General Offices—Court St., Toronto, Ont.
Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts, and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from misrepresentations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.

W. SMITH, Manager.

TIMBER SALE.

THE TIMBER on certain lots in the townships of Eastnor, Lindsay, St. Edmund, Albemarle, and Amabel, in the County of Bruce, and Keppel, in the County of Grey, in the Province of Ontario, will be offered for sale at Public Auction in blocks of 200 acres more or less, on the 12th day of October next, at ten o'clock a.m., at the Indian Land Office, in the Village of Wiarton.

Terms of Sale to be: A Bonus payable in cash, a License Fee also payable in cash, and dues to be paid according to Tariff upon the Timber when cut.

The purchasers of timber to have the option of purchasing, without any conditions as to settlement, the land on which it grows, at a price to be determined by the Department, and to be made known at the time of sale, and to be paid one-third down and the balance in two equal consecutive annual installments, with interest at six per cent.

For full particulars please app'y to Wm. Simpson, Esq., Indian Land Agent, Wiarton, or to the Department of Indian Affairs, Ottawa

No other paper to insert this advertisement without authority through the Queen's Printer,

L. VANKOUGHNET,
Deputy of the Supt. General of Indian Affairs.

DEPARTMENT OF INDIAN AFFAIRS,
Ottawa, 30th August, 1886.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Breakwater, Port Arthur," will be received until FRIDAY, the 8th day of October next, inclusively, for the construction of a further length of

BREAKWATER

AT

PORT ARTHUR,

THUNDER BAY,

according to a plan and specification to be seen on application to Mr. W. F. Davidson, Harbour Master, Port Arthur, and at the Department of Public Works, Ottawa, where printed forms of tender can be obtained.

Persons desirous of tendering are requested to make personal enquiry relative to the work to be done, and to examine the locality themselves and are notified that tenders will not be considered unless made on the printed forms supplied, the blanks properly filled in, and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque made payable to the order of the Honorable the Minister of Public Works, *equal to five per cent.* of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 10th September, 1886.

Wrought Iron Shanty Cook Stoves

The Best Article ever offered to the Trade.

I have much pleasure in drawing attention to my **WROUGHT IRON COOKING STOVE**, for Shanty, Hotel and Boarding House use. These Stoves are made of Heavy Sheet Iron, the top and lining of the fire-box being of Heavy Cast Metal and all the connecting parts of substantial Wrought Iron Work. The dimensions of these Stoves are as follows:

Top surface contains six 10-inch holes, fire box 28 inches long, and one oven 19x34x23.

The Best Stove I have ever Used.

PETERBOROUGH, May 31, 1880.

ADAM HALL, Esq., Peterborough. Dear Sir,—I have used your Wrought Iron Cooking Stove in our lumbering operations since its introduction here, and have no hesitation in saying that I prefer it to any other. For durability, economy and efficiency, where a large number of men are employed, it is the best stove I have ever used. You can, with confidence, offer it to hotels, boarding houses and lumbermen.

Yours truly, THOS. GEO. HAZLITT.

The Stove for Lumbermen.

PETERBOROUGH, June 3rd, 1880.

ADAM HALL, Esq., Peterborough. My Dear Sir,—We have used your Wrought Iron Cooking Stove and find it is very satisfactory for lumber operations, especially so on drives. We can recommend it highly.

Yours truly, J. M. IRWIN.

Gives the Greatest Satisfaction.

PETERBOROUGH, June 3rd, 1880.

A. HALL, Peterborough. Dear Sir,—I have had the Wrought Iron Cooking Stove, purchased from you, in constant use ever since last fall, and it gives the greatest satisfaction in every respect. I can recommend them highly to any one who is in the lumber business. Very truly yours, GEO. HILLIARD, M. P.

EVERY STOVE GUARANTEED

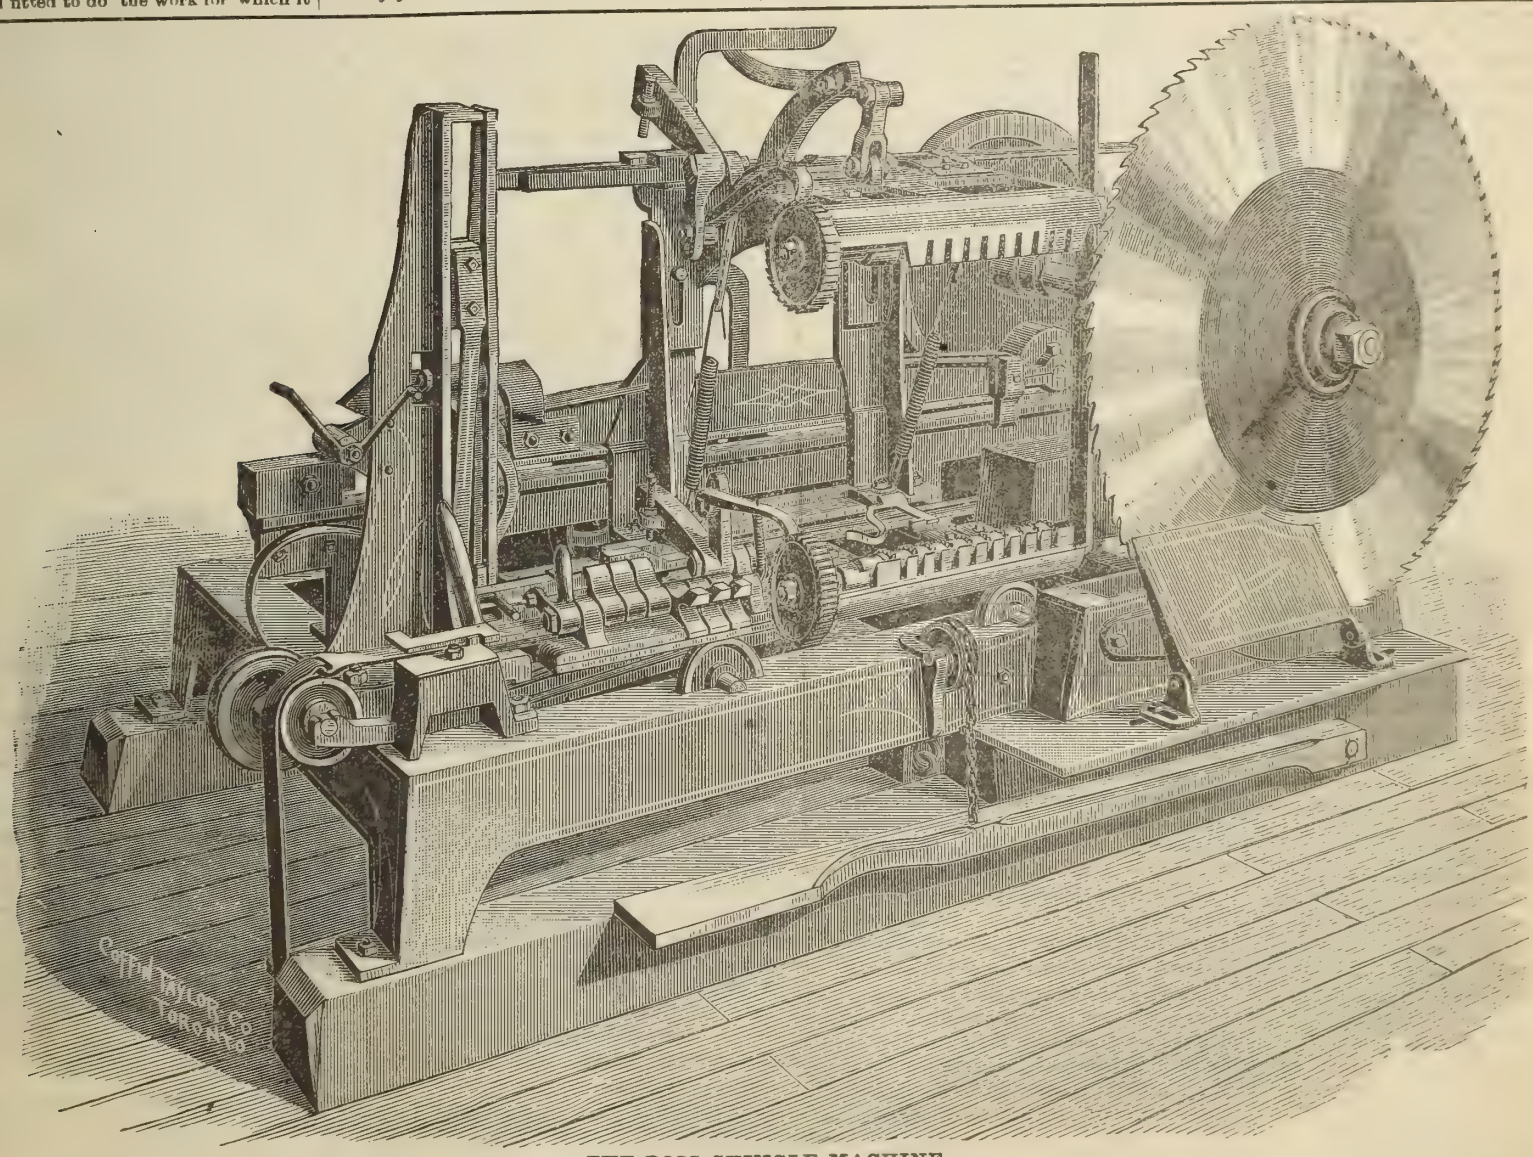
THE "BOSS" SHINGLE MACHINE.

It has very rarely occurred in the manufacture of machinery, for specific or particular work, that the inventor has been able at one step to produce a machine simple and complete in all its parts, and fitted to do the work for which it was designed in a first-class manner. On the other hand, it is the experience of inventors and users of machinery, that by slow processes of development and minor improvements from time to time, crude and imperfect machines have been brought to such a state of mechanical perfection as to far exceed their most sanguine expectations. With the machine that we herewith illustrate (which is the invention of Mr. Isaac M. House, of Gravenhurst) this latter thought is especially true. Mr. House has been engaged in the perfecting of machinery for the manufacture of shingles and lath for the last twenty years. He has at least four patents for shingle machines in the Canadian patent office, each of which is a marked improvement over its predecessor, but it was only within the last year that Mr. House was able to produce a machine which he believes will fully please every manufacturer. His machine has a number of excellent points about it. It is automatic in its operation, and thoroughly under the control of the sawyer. Buts or tips can be cut continously at either end of the block, at the pleasure of the operator, thus enabling the sawyer to take the best shingles possible out of the material. Another very important improvement is in connection with the feed carriage, which travels at a fast rate of speed for narrow shingles, and at a slow rate of speed for wide shingles or heavy cuts; there is no jar about the carriage when reversing and the top jaw is raised by a foot lever instead of by hand, thus leaving the operator with both hands free to arrange or handle the block. The whole machine appears to be very simple and complete in all its parts and perations—strong and durable and not likely to get out of order. Its capacity is from 25 to 50 M. of shingles per day, according to the quality of the material and the speed at which the machine is run. We understand that these machines are already attaining quite a popularity and in some cases are displacing automatic machines of less modern design.



THE BOSS SHINGLE MACHINE.

Mr. A. R. Williams, of the Soho Machine Works, Toronto, controls the patents for Canada and the United States.

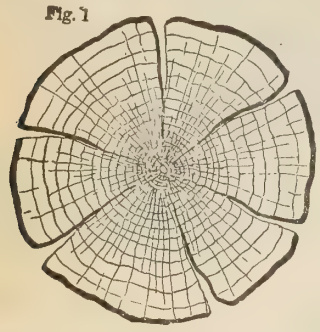
MONTREAL papers are agitating for a graving dock for that city.

HOW LUMBER SHRINKS.

A story is told by the "Arkansaw Traveller," about the manner in which lumber was "hauled" across the mountains down in his country. "Why!" said he, "they saw it green, leave it in the sun, and off it starts. I have seen a board turn three summersaults in less than a minute, and get to the other side of the mountain before sunset." "What," asked a bystander, "would be the result if it was attacked in its wild career by a shower of rain, would it come back?" Here was a poser, but the traveller was equal to the occasion and replied: "No, it would turn on the other side and continue its course."

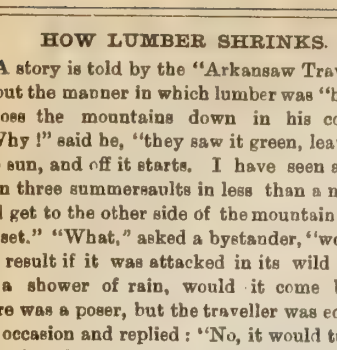
The subject of the contraction of lumber is an interesting one to wood-workers, and the doors

Fig. 1



and shutters in many of our mushroom cities are said to come off the hinges in retalation of the persistent disobedience of the natural law of shrinkage. An examination of the end of an oak or beech tree will show the arrangement of its structure. It consists of a mass of longitudinal fibrous tubes, arranged in irregular circles that are bound together by means of radial strings or shoots, which have been variously named; they are the "silver grains" of the carpenter, or the "medullary rays" of the botanist, and are in reality, the same as end wood, and have to be considered as such, just as much as the longitudinal woody fibre, in order to understand its action. From this it will be seen that the lateral contraction or collapsing of the ongitudinal, porous, or tubular part of the

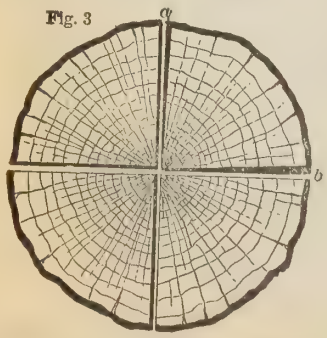
Fig. 2



structure, cannot take place without first crushing the medullary rays, hence the effect of the shrinking finds relief by splitting in another direction, namely in radical lines from the centre, parallel with the medullary rays, thereby enabling the tree to maintain its full diameter, a shown in Fig 1.

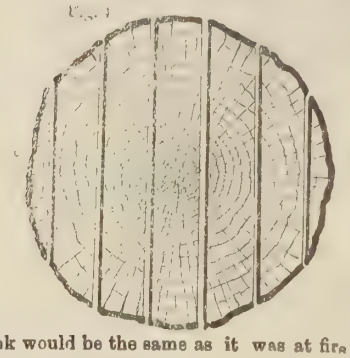
If the entire tubular fibre composing the tree were to contract bodily, then the medullary rays would of necessity have to be crushed in the radial direction to enable it to take place, and the timber would thus be as much injured in proportion as would be the case in crushing the wood in the longitudinal direction. If such an oak or beech tree is cut into four quarters, by passing the saw twice through the centre at right angles, before the contracting and splitting

Fig. 3



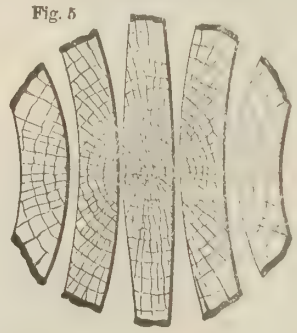
have commenced, the lines *a c*, and *c b*, in Fig 2 would be of the same length, and at right angles to each other, or in the technical language of the workshop, they would be square, but, after being stored in a dry place, say for a year, it would then be seen that a great change had taken place both in the form, and in some of the dimensions; the lines *c a*, *cb*, would be the same length as before but it would have contracted from *a* to *b* very considerably, and the two *c a*, and *c b*, would not be at right angles to each other by the portion here shown in black in Fig. 3. The medullary rays are thus brought closer by the collapsing of the vertical fibre.

But supposing that six parallel saw cuts are passed through the tree so as to form it into seven planks, as shown in Fig. 4, let us see what would be the behavior of the several planks. Take the centre plank first. After due seasoning and contracting, it would then be found that the middle of the board will still retain the original thickness, from the resistance of the medullary rays, while it will be gradually reduced in thickness toward the edges for the want of support, and the entire breadth of the



plank would be the same as it was at first, for the foregoing reasons, and as shown in Fig. 5. Then, taking the planks at each side of the center, by the same law their change and behavior would be quite different; they would still retain their original thickness at the centre, but would be a little reduced on each edge throughout, but the side next to the heart of the tree would be the reverse, or hollow, and the plank would be considerably narrower throughout its entire length, more especially on the face of the hollow side, all due to the want of support. Selecting the next two planks, they would be found to have lost none of their thickness at the centre, and very little of their thickness at the edges, but very much of their breadth as planks, and would be curved round on the heart

Fig. 5

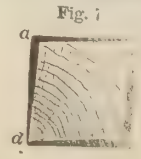


side, and made hollow on the outside.

Supposing some of these planks to be cut up into squares when in the green state, the shape that these squares would assume, after a period of seasoning, would entirely depend on the part of the tree to which they belonged; the greatest alteration would be parallel with the medullary rays. Thus if the square was near the outside the effect would be as shown in Fig. 6, namely, to contract in the direction from *a* to *b* and after a year or two it would be thus, as Fig. 7, the distance between *c* and *a* being nearly the same as they were before, but the other two are brought by the amount of the contraction closer together. By understanding this natural law, it is comparatively easy to know the future behavior of a board or plank by carefully exam-

Fig. 6

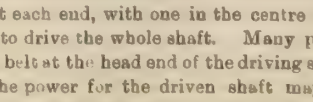
Fig. 7



ining the end of the wood, in order to ascertain the part of the log from which it has been cut as the angle of the ring grows and the medullary rays will show as in Fig. 8.

A plank that has it will evidently show to ave been cut from the outside, and for many years it will gradually shrink all to the breadth. While the next plank shown in Fig. 9, clearly points to the centre or heart of the tree, where it will not shrink to the breadth, but to the varying thickness with the full dimensions in the middle, but tapering to the edges, and the planks on the right and left will give a mean, but with the centre sides curved round, and the outside still more hollow. These remarks apply more especially to the stronger exogenous wood, such as beech, oak, and the stronger firs. The softer woods, such as yellow pine, are governed by the same law, but in virtue of their softness another law comes into force, which to some degree effects their behaviour, as the contracting power of the tubular wood has sufficient strength to crush the softer medullary rays to some extent, and hence the primary law is so far modified. But even with the softer woods, such as are commonly used in the construction of houses, if the law is carefully obeyed, the greater part of the shrinking, which we are all too familiar with, would be obviated, as the following anecdote will serve to show: It was resolved to build four houses, all of the best class, but one of the four to be pre-eminently good, as the future residence of the proprietor. The timber was purchased for the entire lot, and the best portions were selected for house No. 1, but by one who did not know the law, and to make certain of success this portion of the wood had an extra twelve months' seasoning after it was cut up. The remainder of the wood was then handed over to a contractor for the other three houses, who had an intelligent young foreman, who knew the structure of wood as well as how to obey the law, and who, therefore, had the

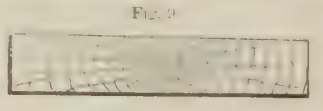
Fig. 8



wood for the three houses cut up in accordance therewith. The fourth house was built the following year by another man; but long before ten years had passed to the great surprise and annoyance of the proprietor it was found that his extra good house had gone in the usual manner, while the other three houses were without a shrinkage from top to bottom.

A similar want of correct knowledge of the natural figure and properties of the structure of wood, such as the oak, is constantly shown by the imperfect painting to resemble that wood, as exhibited on doors and shutters of many houses. If we cannot afford to have genuine wainscot doors as in France and other countries, but yet desire

Fig. 9



to have an imitation, it would surely be worth the trouble to have a block cut from the quarter of an oak tree, and to have each of its six sides planed and polished, in order to make plain their several features. The house painter would then see who nature really is, and thus save us from the ridicule of other nations, when we mix up "silver grains" and all the other natural features upon one side of a board or panel. This is a subject that should interest all wood-workers and builders and a great deal of attention should be given to the structure of the various woods. It is almost as necessary for a wood-worker to understand the anatomy of his tree, so to speak as a surgeon to understand the anatomy before he commences to operate. The importance of the subject is therefore obvious.

SUPPORTING THE SLACK SIDE OF AN OPEN BELT.

One of the simplest problems in belting is to make use of the open belt in connecting one line of shaft with another, yet how greatly mill men differ in this respect. One must have a belt at each end, with one in the centre large enough to drive the whole shaft. Many prefer a single belt at the head end of the driving shaft, where the power for the driven shaft may be taken at once without creating an extra loss of transmitting power any further than need be. And there are others who admire the idea of having the power for the farthest extremity pass down the driving shaft across to the other on a belt, where the slack on the under side will hang down in front of a doorway, and then back again very nearly opposite from where it started. Rope belts and bevel gears still take an interest in this problem and friction wheels in special cases are still recommended. A stiff connecting rod, with slip-bearing in the centre, has been patented in a number of forms for this very purpose, and the three tie connecting rods made from wire rope will work very well where the shafts extend in opposite directions from the wheels that must have three equidistant crank pins, and all for the purpose of accomplishing what an open belt will do to a nicety if the belts are anywhere near perfect. There is nothing that will cause a belt to switch and thrash so well as to lace in a piece of old belting that is of an entirely different grade of material, and yet how quietly they travel when every portion of the belt is similar throughout. When the shafts are supported on the same level, it is no doubt desirable to bring the slack side on the upper fold where the sagging of the belt will have a tendency to increase the hold on the pulleys, but mill men do not always have their choice in the direction that an extra line of shafting is to run, and where the distance is very great a supporting wheel must be called into play to help the slack side from sagging down into the way of the machinery. The shafts are up in the loft of the building where glass cutting and grinding is carried on, and the upper fold has none too much room to pass from one pulley to the other. In this method the three-quarter twist is made use of, which allows the lower stretch to be carried as much above the tight side as it would be desirable to have it below, which gives the belt all the advantage found in a crossed belt. The tight side comes perfectly flat in the centre of the fold where it is in need of all the room there is to spare. If the belt is inclined to brush together much in the crossing, the supporting wheel can be placed to favor it in this respect the same as in every case where three wheels enter into the system for a belt to travel in one direction and still retain sufficient lead in the pully to hold the belt in place while running in the opposite direction.—*Boston Journal of Commerce.*

LABOR SAVING MACHINERY.

Discussing a question which it is not easy to keep down, especially in times of labor agitation and discontent, the Washington *Post* says: "Every labor-saving machine is also a laborer-saving machine. It works for far less than men can, and yet, curiously enough, it oppresses nobody, and robs nobody of wages. On the contrary, it increases wages.

"When George Stevenson, fifty years ago, flung his railway track from Liverpool to Manchester, and whisked a train across it at twenty five miles an hour, all the stage companies held indignation meetings. When the Central Railroad crept up to Rochester, N. Y., farmers met and mobbed the 'new-fangled contrivance,' and drove off the workmen, on the ground that if it should succeed, 'horses wouldn't be worth $10 apiece.' What was the result? Horses that were worth $50 apiece before, readily sold for $100 as soon as the road was finished.

"When Patrick Bell set his reaper into an English wheat field, the excited sickle-reapers broke over the hedge, and captured and burnt up the machine. But those who lived ten years saw it was a blessing to all. The threshing-machine does the work of seventy men; the mowing-machine, tedder, horse-rake, horse-fork and portable engine, in agriculture, are almost equally as effective; yet the wages of farm hands have doubled since these auxiliaries were invented, and were never so high as now.

"Is the sewing-machine, which does the work of twenty women, a disadvantage to seamstresses? Of course not; for their wages are a great deal higher now than they were before.

"Is the automatic boom a disadvantage? No; the number of employed is proportionately less, but their wages are higher, and all the other works in the world are tremendously benefitted by the increased cheapness of fabrics.

"Does the gang-saw rob the lumberman who used to split out boards with wedges? No; for it has enabled men to live in houses, who before dwelt in shanties of bark or in cabins of mud. The workingman is the chief consumer of the oducts of work."

ADVERTISEMENTS.

Those wishing to **BUY** or **SELL TIMBER LANDS, LUMBER** or **SECOND HAND MACHINERY** will find THE CANADIAN LUMBERMAN an excellent medium in which to make known their wants. Advertisements, of this character will be inserted at the low rate of **1 CENT A WORD**, cash to accompany the order in every case. Address.

A. G. MORTIMER, Publisher,
Peterborough, Ont.

General News Notes.

LUMBERING is said to be booming at Baysville, Ont.

THE Ottawa mills are now nearly finished sawing.

THE *Echo* is agitating for a port of entry at Fort William.

THE Essex Centre Manufacturing Co. have sold out their extensive saw mill to T. H. Decew.

IN the turtle mountain district of the northwest $1 000,000 worth of timber has been destroyed by fire.

EDWARD SWALES, of Midland, had his hand badly cut by a drag saw falling on it at Chew's Mill recently.

THE *Armenia* was recently loaded at Deseronto, with a cargo of lumber for a life saving station which is to be established at Smith's Bay.

AN exchange asks: "What has become of the straw lumber which three or four years ago we were told would revolutionize the lumber business?"

MR. A. C. Manzor. of Burk's Falls, is running the Spring Valley Saw Mill to its full capacity on local trade and cannot supply the demand, the call for lumber for local purposes being so great.

THE mills of Messrs. Grier & Co., at the Chaudiere, shut down Thursday for the season. They have lately been employed cutting dimension timber for the erection of a new and more capacious saw mill.

SINCE January 1st there has been added to the wood-working industries of the South about 250 lumber mills, or an average of one and half new lumber mills per day. Within the same time over $60,000,000 has been invested in productive establishments of various kinds.

A READER of the Kingston *Whig*, says that during the time the dockyard was in operation, there was any quantity of oak timber in Navy bay, and that some must be sunken under water in the mud. Some of it was recovered many years ago, but plenty of it he says must remain.

THE *Observer* says, the steamer Sir John Young, owned by the Upper Ottawa Towing Company, and heretofore plying on Lower Allumette and Coulonge Lake, has been condemned and broken up. Her machinery has been taken out and brought to Pembroke, where it will be placed in a new hull to be built this fall and winter.

THE Chaudiere during the last heavy rains rose some 30 inches, and some 20,000 to 30,000 logs were driven nearer the mills; it however, fell very rapidly again, and it is far from certain whether even that small proportion of the logs stuck will be driven to the mills in time to cut up this fall.

IT is now a very serious question with the Chaudiere owners of logs whether they will be able to drive the logs this fall, and get them into a safe place to winter them before the ice comes on, in which case it would be a heavy loss as the freshets in the spring would carry all the logs into the St. Lawrence.

THE Chaudiere mills are all running at full speed at present. Logs are getting scarce in some of the mill ponds. Mr. E. B. Eddy, intends to run his saw mill until the closing of navigation. Messrs. Perley & Pattee, J. R. Booth, Hurdman & Co. will probably close about the end of this month.

THERE has been a great flood in Muskoka by the bursting of Osborne's mill dam on the Little East Muskoka river. Four bridges were swept away in Cheffey, and the N. & P. J. Railway iron bridge across the Little East River greatly damaged. Much damage has been done, and will take some time to repair it.

A despatch from St. Paul under date of Oct. 20th says:—A great fire is raging in the Turtle mountain district. Over 200 square miles of the prairie and timber land have been burned. Thousands of tons of hay have been destroyed with a large number of houses, barns and crops and all kinds of stock. Many of the settlers have lost all there possessions. Losses $1,000,000.

A CORRESPONDENT to the Bobcaygeon *Independent*, writing from Haliburton says: "There is more lumbering this year than last. A firm has started shanties out eastward in Harcourt, and all supplies come this way by railway, and are sent in by team. We shall do a good business this season in lumber, and there will be plenty of market for farm produce.

Archibald McArthur, near Madoc, Ont., has raised a good saw mill on the Mississippi Branch on the site of the old mill which was burned two years ago. The new mill is one hundred feet long, three storeys high, and will contain apartments for wool carding. Mr. McArthur intends to build in future a grist mill, and a mill for manufacturing cloth.

THE sailing barge *Bentley* which left Parry Sound, Thursday, Oct. 14th, with 500,000 feet of Lumber was caught in a big storm on Thursday night. She lost a portion of her deck load off Red Rock Light-House but managed to run across the Georgian Bay to Cabot's Head when the wind shifted and drove her ashore. She is thought to be a total wreck; the crew were all saved. Two other vessels are also ashore at Cabot's Head.

THE Saunders & McPherson Saw Mill at Burk's Falls is running from daylight to dark on the Ontario Lumber Company contract, and cannot as yet cut for the local trade. This firm has been making important improvements—having cribbed along the edge of the mill pond to the Government Road, and are filling and levelling up, thereby adding a large extent of piling ground. They are paying out from $20 to $25 per day for labor, and this is expected to last until the close of the season.

A correspondent writing to the Pembroke *Observer* says:—"Just to ease my mind, I drove up to Messrs. Booth & Gordon's shanty on the Indian River, where Mr. James Carmichael was improving. I witnessed some of the biggest work, done by him in twenty-four days, with seven men and one span of horses, three dams and three slides, one dam 400 feet long, 12 feet high, the slide being 307 feet long, the other 198 feet long, 14 feet high. The slide was 208 feet long. The other dam was 50 feet long, 21 feet high. The slide was 64 feet long. I think it is about the biggest work that has been done on that or any other stream since the first dam was built in Canada.

PREPARATIONS are in progress for the erection of a large building in connection with the car works and shipyard department of the Rathbun Company, Deseronto. The new structure will be 110x36 feet, and 14 ft post. It will contain a large dimension planer for dressing car sills and long plank and timber; also a circular edger for cutting up refuse and edging long stuff. The ship-frame saw will also be transferred to it and a railway track will run through its whole length to carry stuff to and from the shops. The machinery in the old shipyard shed will be regulated to suit the new machinery. The old shed will be used for mortising, tenoning, cutting off and fitting up the material for car and ship-building. In fine the new establishment will be quite an acquisition to Deseronto.

PARTICULARS come from Camp Gilmour, Que., of one of the worst crimes ever perpetrated in Canada. A party of six lumbermen came up from Lower Gatineau lumber camps, bringing a large quantity of rum. They were all more or less intoxicated. Soon after midnight the gang made a raid on a house occupied by Mrs. Turcotte, just outside the camp, and finding only the old lady Turcotte and her daughter Nellie at home, they fastened the old lady to a chair gagged her, and then tying the hands and feet of the daughter, the men criminally assaulted her. The girl, who is but 16 years old, fainted, and fearing that she was dying the men released her mother. Finding herself free the old lady made her escape to arouse the camp, when the men set fire to the cabin and escaped to the woods. It was not known for some time whether the girl was left to perish or carried away, as the cabin was so far destroyed when help came that it was impossible to make any search. Later the girl was found with her throat cut from ear to ear, in a thicket near the remains of the cabin. The men have escaped, and while there has been a searching party out to look for them, it is doubtful if they will be discovered, owing to the great number of men constantly going and coming from this section, which is purely a lumbering region.

THE Chicago *Timberman* remarks that "Mr. T. K. Edwards, who is well known in this part of the country, and through the south, as the lumber agent of the Illinois Central Railway, is entitled to the credit of introducing, to this city, a new finishing wood, red cypress, which though it has been employed in other places, has never before been used here. Mr. Edwards has had a room in his own house finished in the wood, and the result is especially gratifying. The color of red cypress finished resembles gum, but the markings are more distinct, and in infinitely greater variety. In its peculiar varieagations of color the wood is remarkable, and its beauty in this respect, with its fine, close texture and susceptibility to a high degree of polish, must give it a foremost place among fancy finished woods, It will necessarily come into this category, as the quantity of it to be had is very small. The lumber used by Mr. Edwards came from the mill of Messrs. Farr & Williams, at Pattersonville, St. Mary's Parish, La. This variety of cypress grows altogether in the water, and it is so heavy when it is cut that it can only be floated by chaining it between two logs of lighter wood. It is a handsome material for inside finish, or even for cabinet work, and it is bound to be in demand when its beauty becomes generally known."

NEW BRUNSWICK.

MADAWASKA, October 28th, 1886.

MR. EDITOR.—It's good for sore eyes to see the CANADA LUMBERMAN again on our table, and I must say that the earnest welcome always accorded its readers for the free use of its columns for the discussion of all pertinent questions is too well known to make further comment necessary.

I notice among your "Exchange Echoes," the *Southern Lumberman* seems to have various opinions about the custom relative to the measurement of hollow logs. No doubt it will be a difficult task to frame any correct rule, which will satisfy both the purchaser of lumber and the manufacturer. Surveyers are supposed to measure lumber so it will hold out after it has been put through the mill, and in order to do so he must use his own discretion as to how much to throw off for defects, and make the lumber merchantable. In measuring cedar for shingles in this province, they measure two thousand as they come, allowing one thousand of the same as merchantable, throwing off one half to make them hold out. The same paper further says: "The Canadian Government wants reciprocity or free trade in lumber with the United States." I beg to disagree. If we look after the interest of Canada, not one stick of lumber should be allowed to leave it before it is manufactured, and Canada reap the benefit of its own resources. The article above quoted winds up as follows: "Whenever there is a doubt what course to pursue, it is always safer to do—nothing." If we never experimented on doubt, we will continue to live in doubt, and the rest of humanity will be content to leave us in the same frame of mind. All doubts should be tested. One thing is certain, where no doubts exist, if we allow our forests to be slaughtered and manufactured over the lines, we are killing the goose that lays us the golden eggs, and the near future will prove it to the sorrow of the rising generation.

I believe in free trade, provided it was universal, and am satisfied that free trade and direct taxation is the true policy for any nation to deal out equal rights to rich and poor. Under the revenue tariff system, a poor man raising one dozen children adds more to our revenue than a rich man with no children at all; but we may not expect any change so long as capital rules labor. The former has the power and will hold on to it as long as they can.

I see remarks about our export duty on logs, which should be prohibited until manufactured. Americans seem to think the export duty is only put on to retaliate against the import, but if they would change places with us Canadians, and see their forest wealth slaughtered, and brought over on our side to be manufactured, and by that means build up our trade, they could see themselves as others see them. However, if the export duty is not enforced more elsewhere than it is in Madawaska, the Americans will not know that such a duty exists. I always thought that the N. P. was intended to encourage the manufacture of raw material, and the building up of mills, etc., but, strange to say, the forest wealth of Madawaska, is slaughtered and taken over the lines, and there manufactured in order to save import duty, and this by New Brunswick capital, which has monopolized nearly all our wild lands, and erected mills on the American side, and robbed our country out of fifty million dollars a year in shingle stuff and other lumber. No doubt capital will cause a delay to exact the export duty until the horse is stolen, then our government will lock the door.

Hoping that the CANADA LUMBERMAN may find its way into every dealer's hands in Canada, in order that they may be kept posted on matters so important to this great industry.

Very respectfully yours,
P. O. BYRAM.

RAILWAY NOTES.

WORK on the Hudson Bay railway began on Oct. 11th.

IT is reported that a contract has been let to take out 40,000 ties from Rat Portage District for the Hudson Bay Co.'s Railway.

THE survey of the extention of the Napanee, Tamworth, and Quebec railway, from Tamworth to Marlbank has just been commenced.

THE Grand Trunk railway directors have decided to recommend a dividend of 1 per cent. per annum on the 4 per cent. guaranteed stock, leaving a small debit balance.

H. WHYTE, general superintendent of the C. P. R., has accepted the presidency of the C. P. R. library board, formerly held by the late general superintendent, Mr. Egan.

THE Canadian Pacific railroad have been compelled to put on extra forces of men in their car shops in Cobourg, Perth, and elsewhere, in order to meet the increasing demand for car caused by the enormous growth of traffic on their line.

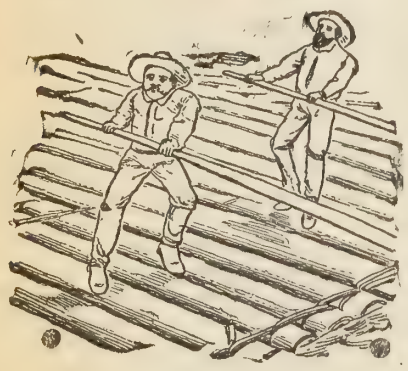
A COMPANY of local capitalists has been formed in Winnipeg for the purpose of securing the construction of a line from Winnipeg southerly one hundred miles to the eastern boundary of Carillon county. The company is to be known as "The Winnipeg, St. Boniface & Carillon railway company."

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh. Out of 2,000 patients treated during the past six months, fully ninety per cent, have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is pratically cured, and the permanency is unquestioned, as cures effected by him four years ago cures still. No one else has ever attempted to cure Catarrh in this manner, and neither treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.*

LIFE ON A RAFT.

Men and Methods Formerly Seen in Daily Life.

The days of rafting on the Mississippi have gone to join the days of romance, says a writer in a late issue of the St. Louis *Globe-Democrat.* Progress has pushed this business with a great many other slow, but sure, and good things to the wall, and steam machinery sings a monotonous lullaby above its cradle. More white pine comes to this market now from the Wisconsin, Black and Chippewa rivers than ever before, and if the process of getting here was the same as in the early days the grand army of raftsmen, instead of being reduced to almost insignificant proportions, would be as magnificant in its numbers as are the ranks of other industries that have maintained their own against the march of invention. The good old days when rafting was much lower than it is now, will be recalled by many. Those were darling times, as the boys say. Men followed rafting as a regular business, and experience was as necessary as in any other line of skilled work in which a man might embark. A good rafter knew the river like a pilot and was as much at home in its channel as a red dog is under a kitchen stove. Life in the lumber camps and on the rolling wave, was full of its pleasures, and even the hours of toil were sent spinning along on the wheels of music and song. There was lots of fun in the business, and the girls along the shore had their little romances to tell as the fleets went by—romances just like those girls on land can tell.



PULLING INTO THE CHANNEL.

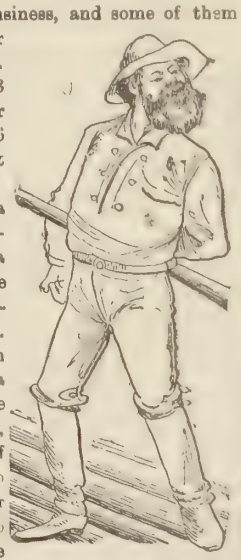
The same old tale.

The old, old story, that has often been told before,
For one heart will trust and another will fail
Until time and change shall be no more.

The history of those days and nights are left in pleasant rhymes, rattling stories and gleesome songs—some printed and some carried around in the shape of traditions—that once gladdened the hearts of thousands of rafters. As has been said, rafting was slower then than now. It took over two months to bring a fleet of lumber in those times from Wisconsin to St. Louis, where now it takes but two weeks, and of course it was necessary to beguile the hours with pleasures of a popular sort. Every fleet had its fiddler who could scrape out a break-down and play "Rye Straw," the "Rocky Roads," "Haste to the Wedding," and so on; its warblers who filled the moonlight night with glorious songs; and its story-tellers, always primed to the chin with yarns that raised a laugh and made hearts happy. The saga of those days are replete with the genuine poetry that belongs to simplicity and to nature's children, and the history of the period, if written by some scribe with a Mark Twain vein of humor and a Herodotian fidelity to facts, would make as readable a book as any press ever turned out. The story of rafting on the Mississippi is interesting in every detail. The first recorded arrival of a raft of white pine lumber at St. Louis was in the spring of 1840. The raft was run by twenty men, contained 800,000 feet, and was the first raft to reach here from the vast lumber regions of Wisconsin. The fleet came from near the mouth of the Wisconsin river, and was thirty-five days in making the trip. The history of rafting on the Mississippi, however, antedates this period. It goes back to 1831-32. In those days all the rafting was done within 300 miles of the city. E. O. Shepardson, possibly one of the oldest Mississippi river raft pilots, gives it as his opinion that the first lumber raft arrival at St. Louis was in the spring of 1835 He describes the raft as having been 100 feet in length, 30 feet wide, and carrying 150,000 ft. The lumber was yellow pine, cut and rafted in the Gasconade river, about 125 miles from the mouth. The distance from there to St. Louis was 250 miles, and the time required to make the run was seven days. Up to 1840 the principal lumber arriving here in rafts was yellow pine and hard woods. From 1835 to 1840 the receipts ranged anywhere between 1,500,000 to 3,000,000 feet per week.

THE COOK'S CASTLE.

In 1840 the receipts of white pine lumber aggregated 3,000,000 feet. The rafting business from that time on, had a most remarkable growth, and the following two years numerous saw-mill men of the North followed the example of the pioneer raftsmen, and the result was that hundreds of men were furnished with work in the new field, and the upper river was continually filled, in season, with moving rafts. In 1842, two years after the arrival of the first fleet of white pine lumber, the receipts aggregated 75,000,000 feet, which gives a well defined idea of the rapid increase in the interest. The growth continued with each season until 1860, when the rafts landed 200,000,000 feet of white pine lumber at the North St. Louis landings. During the four years following there was a slight interruption, the result of the civil war. The urgent demand for lumber, however, during that bloody period, brought many new capitalists into the business, and some of them retired after the war with large fortunes. From 1865 to 1872-73 the raftsmen saw their best days. In 1866 the Schulenburg & Boeckeler Lumber Company invented a patent steam windlass, which enabled a steamboat to handle a raft of from 1,000,000 to 3,000,000 feet. This invention brought with it a great reduction in the cost of running a raft, reduced the danger of wrecking it, and also reduced the number of men required to handle it. The Mollie Whetmore was the first steamer to attempt to run a raft in this way and she proved a success. Other steamers followed in the business, and last summer there were 100 boats employed in the trade, the aggregate value of which is put down at $1,000,000.



CAPTAIN OF RAFT.

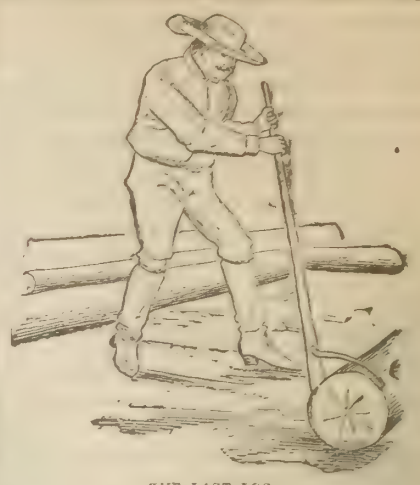
The average raft boat carries a crew of eighteen, which includes the mate and captain. A good stout raftboat is able to push a fleet containing as much as 3,500,000 feet of lumber. To move this vast quantity of lumber by rail, would require seven trains of fifty cars each. The time necessary to tow such a raft from La Crosse, Wis., 700 miles north, to St. Louis, is generally fourteen days, although runs have frequently been made in less time. Nearly all the white pine lumber received in St. Louis comes from Wisconsin, Black and Chippewa rivers. The rafting season opens in the spring as soon as the ice runs out. The first raft of the season from the Upper Mississippi usually arrives here at the beginning of May, and the season windsup about November 15th. The local season, however, has been known to extend into December. With the advent of raft boats, the days of floating rafts reached their end, and the business to day compared with its former greatness is but a shadow, there being very few floating rafts now seen. Where it formerly required two months' time and thirty five men to run a raft from Wisconsin to St. Louis, a steamboat now does the work in fourteen days, with the aid of eighteen men, thereby reducing the cost more than one-half In the best days of floating rafts, the cost of running one from Reed's Landing or Stillwater to St. Louis, would reach as high as $6,000.

CHEF DE CUISINE

From 1865 to 1870 lumber rafts were frequently taken as far South as Memphis and Vicksburg. Now not more than two rafts in a year go south of St. Louis, and these only as far as St. Mary's and Chester. The longest distance ever run by a raft on the Mississippi, was from La Crosse, Wis., to New Orleans. The trip was made in 1870, and this lumber raft was the only one that ever went to New Orleans from the Upper Mississippi. The fleet was made up of ten strings, or about 1,100,000 feet. It was owned by the Gruner Brothers Lumber Company, and was valued at $30,000. Mr. E. O. Shepardson, at present raft superintendant of the Ganahl Lumber Company, piloted the fleet as far out as Vicksburg, where a Lower Mississippi River pilot took charge. The run from La Crosse to New Orleans was made in ten weeks. There are eight regular raft boats coming to this port which bring in each season about 150,000,000 feet. This does not include what outside steamers tow in here, which swells the figures to 200,000 000 feet. The principal lumber landings are located in North St. Louis, and take in the principal part of the wharf from North Market street to Bissell's point. The landings are controlled by the Knapp, Stout & Co. Company, Eau Claire Lumber Company, Gruner Brothers Lumber Company, Henry Lange, the Schulenburg & Boeckeler Lumber Company and I. G. Buckley. The landing in the southern part of the city is in charge of the Ganahl Lumber Company.

These are dry details that do not by any means suggest the departed greatness of the days of floating rafts. The captain of a fleet was, as it were, monarch of all he surveyed. He was the political, religious and civic boss of the men in his employ, and he lorded it over them in a majestic, but, at the same time, quite a humane way. Usually a man of magnificent build, the shaggyness of his exterior gives no idea of the bigness of his heart. Heavy-bearded, top-booted, and filled with the bracing health of the pineries, his presence inspires awe for the moment, but as soon as his mouth opened and the pleasantness of his coarse mouth fall upon the ear, the feeling of sublimity gave way to one of admiration, and soon he held your heart in his hand. There were, of course, some rough captains in the old days, but they have quite perished out of memory, and only the agreeable characters remain behind.

There were many exciting times in the lives of the old rafters. When they made the shoot of the rapids there was danger in their positions, but just like the men who court death in the log booms, these old chaps braved any danger, and their days and nights were often full of the enthusiasm and excitement that are born of the proximity of trouble. There were not, as a matter of fact, many such thrilling experiences as that related by the literary liar who wrote the "Pike County Folks," but there were some almost equally as interesting. Shooting the rapids was frequently the least dangerous of their exploits. Pulling the channel or steering shy of a bridge, calls for as much care and coolness of nerve as any other effort put forth by the raftsmen. The forward sweeps had to be worked with great skill, as the slightest error of judgment or misapplication of strength might prove fatal to the rafter and injurious to the fleet. The cook was the canonized saint of the party. The sound of his dinner gong was sweet and welcome to the raftsmen's ear, and it always got a kind greeting from an overwhelming appetite. The cook's hut, with its V shape, its smoking stove-pipe and bough-trimmed apex—the temple in which about the only worship the rafters knew took place. Here they worshipped three times a day regularly. The culinary high priest took pleasure in tickling the palates of his devotees, and when at work, whether peeling potatoes on the shady side of his hut, or stirring the huge pots of boiling meat, kept their individual and collective tastes in view, and tried to make the meals and meal hours pleasurable to all. The time passed so agreeably that it was really felt to be a moment of sadness when "breaking-up" came and the rafts were picked to pieces, to be piled away in the lumber yards. Then there came the partings for awhile, often for ever, for in the early days raftsmen were as human as men are now and had their frailties. Whisky often brought on fights, and then the knife and pistol came into play. Many a rafter died a violent death, and the story of his taking off furnished gossip on future trips for those who had known and associated with the unfortunate fellow.



THE LAST LOG.

THE LUMBER BUSINESS IN THE OTTAWA VALLEY.

Enormous Output of Square Timber and Sawn Lumber.

Our excellent contemporary the Ottawa *Free Press*, has the following exhaustive article on the lumber industry of the Ottawa Valley:—The leading commercial industry of the Ottawa district is of course the making of square timber and the taking out and manufacturing of lumber of all kinds. A moderate estimate of the capital invested in the lumbering business throughout the watershed of the Ottawa places the figure at sixty million dollars, though some practical authorities place it as high as seventy and seventy-five millions. It may safely be said that the amount of capital invested in the lumbering industry in the Ottawa valley, is almost if not quite equal to the whole of the capital invested in manufacturing in the Dominion. The principal properties or assets of the firms engaged in lumbering are timber limits—that is areas of natural or standing wood, saw mills, improvements on rivers and streams to facilitate log driving, stocks of lumber on hand, piling grounds, and machinery. The area of timber limits under license on the Ottawa and its tributaries in Quebec province is 9,732 square miles and in Ontario 7,153 square miles. The dues upon these limits payable to the provincial governments of Ontario and Quebec are collected at the Crown timber office, the district tributary to that office including the counties of Ottawa and Pontiac in Quebec, and all the territory situated in Ontario, drained by streams falling into the Ottawa. On the Ontario limits within this territory, there were cut, during the season of 1885, saw logs to the amount of 241,000,000 feet broad measure which with about 255,000,000 feet from the province of Quebec furnished material for the employment of some thousands of men and teams in the woods and saw mills and on the rivers. In addition to the saw logs about twenty

million feet of dimension timber were taken out last year. The greater portion of the vast area of limits before mentioned is worked by firms with head quarters in Ottawa city. The following statement shows the principal licensees and workers of limits on the Quebec side of the Ottawa river, and the total area of square miles worked by each :—

Gilmour & Co., 2,659, Gatineau, Keepawa, and Pickanock.
Hamilton Bros., 1,686, Gatineau, Keepawa and Pickanock.
J. R. Booth, 1,423, Coulonge, Black and Keepawa.
James McLaren, 968, Gatineau, Desert, Black, Coulonge and Pickanock.
Ross & Co., 935, Gatineau, Desert, Black, Coulonge and Pickanock.
Alex. Fraser, 848, Ottawa, Black and Dumoine.
Bronson & Grier, 968, Gatineau and Jean de Terre.
Bronson & Weston, 680, Dumoine, Black and Deep
Hon. George Bryson, 652, Coulonge, Keepawa and Ottawa.
Gillies Bros., 744, Coulonge, Keepawa and Ottawa.
Perley & Pattee, 700, Keepawa, Dumoine and Coulonge.
E. B. Eddy, 715, Ottawa and Keepawa.
Hurdman & Co., 558, Coulonge and Magniwippi.
W. C. Edwards, 414, Gatineau, Keepawa and Desert,
Bronson, Weston & Edwards, 369, River Ottawa. Block A.
David Moore, 350, Keepawa river.
McLaughlin Bros., 290, Coulonge.
Latour Estate, 280, Ottawa and Keepawa.
John Ross. 360, Keepawa.
Bryson & Charlton, 385, River Ottawa.
Thomas G over, 330, Keepawa and Dumoine.
Thompson & Mackay, 400, Gatineau.
Grier & Co., 188, Coulonge and Temiscamingue.
Folkerts & McPhee, 191, River Ottawa.
T. & W. Murray, 108 Dumoine and Black.
Jas. Findlay, 100, Black river.
W. R. Oswald, 222, River Ottawa.
William Mackay, 124, River Dumoine.
R. White, 101, Black river.
Peter McLaren, 231, Coulonge river.
Martineau Estate, 100, Jean de Terre river.
Rochester & Doherty, 91, Ottawa river.
McLaren & Edwards, 80 Dumoine river,
James Cotton, 50, Dumoine river.
D. Murphy, 50, Coulonge river.
J. B. Dickson, 81, Keepawa and Ottawa.
John Roche, 56, Le Peche, Gatineau.
H. V. Noel, 65, Gatineau river.
John Smith, 50, Coulonge river.
Est Sir F. Hincks, 50, Coulonge river.
Est. Allan Grant, 85, Black and Dumoine.
R. White, 71, River Ottawa.
Small holders, 630, rivers before named.

The following statement shows the names of the principal holders of limits in the Ottawa agency of the province of Ontario :—

J. R. Booth, 1,208, Ottawa, Lake Temiscaming, Indian, Petewawa and Bonnechere rivers.
Perley & Pattee, 955, Ottawa, Chalk, Montreal, Madawaska, and Petewawa rivers.
Bronson & Weston, and Grier & Co., 636, Mattawa, Petewawa and Amable du Ford.
McLachlin Bros., 676, Madawaska and Bonnechere.
Bronson & Weston, 334, Madawaska and Chalk.
Gillies & McLaren, 283. River Mississippi.
Barnet & McKay, 268, River Bonnechere.
E. B. Eddy, 229, River Madawaska,
Wm. McKay, 174, River Madawaska and Amable du Ford.
McClyment & Co., 118 River Petewawa.
James McLaren, 284, Indian river,
Alex. Fraser, 310, Nipissing, Mattawa and Madawasca.
Thistle, Carswell & Co., 318, Petewawa and Madawasca.
Boyd, Caldwell & Son, 135 Madawasca and Mississippi.
R. Kock, 100, River Ottawa.
Hurdman & Co., 126, Petewawa river.
R. Ryan, 100, Montreal river.
N. E. Cormier, 89, Petewawa river.
Gillies Bros., 54, Mississippi and Montreal rivers.
O. Latour, 75, Ottawa and Temiscaming.
A. Barnet, 50, River Petewawa.
A. & P. White, 30, Ottawa river.
H. M. McLean, 61, River Bonnechere.
Small holders under fifty miles, 500, on streams before menticned.

THE SQUARE TIMBER TRADE.

The following is an approximate estimate of the quantity of square timber made in the Ottawa and Nipissing district during the season of 1885-86 :—

Name of Manufacturer.	Cubic feet.
Fraser, Sereny & Co.	355,000
David Moore	660,000
E. Moore	180,000
Timmons & Gorman	175,000
Klock & Son	295,000
McCool & Doran	177,000
J. & G. Bryson	150,000
J. R. Booth	245,000
R. White	175,000
William Mackey	180,000
McLaughlin Bros.	350,000
Thistle & Carswell	200,000
Barnet & Mackie	390 000
A. & W. Mohr	100,000
Robert Grant	180,000
John Lamb	75,000
Francis & McCray	55,000
Total	4,042,000

The square timber business has declined in recent years. In 1882-83 the estimated output was 8,760,000 feet, and in 1883-84 6,290,000 feet. The output of 1886 was made principally on lake Nipissing and the Keepawa, Colonge. Quinze, Ottawa, Sturgeon, Bonnechere, Madawaska, Mississiaga, Black, Petewawa and Amble du Ford rivers. During recent years the production of square timber has fallen off considerably, but that of sawn lumber has increased with the improved facilities for taking out logs, river driving and shipping the lumber. The square timber produced in this district is taken to Quebec in rafts and there sold for shipment to Europe. Quebec is the great timber market of Canada.

THE SAWN LUMBER.

cut at the mills on the Ottawa and its tributaries is shipped principally to the United States and to other points in Canada. The manner of shipping to the United States is chiefly by means of barges, which are towed down the Ottawa and St. Lawrence and through the canals to Sorel, thence up the Richelieu river and lake Champlain to Whitehall, and down the Hudson to Albany and New York. Considerable quantities of lumber are also shipped by the Rideau canal and Canadian Pacific and Canada Atlantic railways, and latterly some large shipments of square timber have been made over the Canadian Pacific from the lake Nipissing region. The entire annual output of sawn lumber in the Ottawa district is estimated at from 700,000,000 feet to 800,000,000. It is all white pine excepting a small percentage of red and Norway pine. Of the exports to the United States from the Ottawa consular district for the year ending June 30th, 1886, 97.53 per cent, was made up of lumber. In 1885 the percentage was 97.65, and in 1884, 98 22.

THE TOTAL VALUE

of sawn and manufactured lumber exported from this district to the United States in the three years named was :—

1884	1885	1886
$2,843,575	$2,254,801	$2,170,814

The following statement shows the kinds and value of the lumber shipments from the Ottawa district to the United States in the year ending 20th June, 1886 :—

Sawed pine lumber	$2,045,809
Box shooks	46,428
Laths	26,456
Railroad ties	11,604
Pickets and curtain sticks	24,761
Match blocks	8,450
Telegraph poles	2,633
Hemlock bark	528
Fence posts	921
Shingles	976
Doors and moulding	2,118

PROVINCIAL TIMBER REGULATIONS.

The timber limits of Ontario and Quebec are owned and controlled by the governments of the respective provinces. The Ottawa Crown Land agency collect crown timber dues for the Ontario and Quebec governments as well as slide dues for the inland revenue department of the Dominion government. The rates of dues charged upon limits in Quebec is somewhat higher than those charged in Ontario. In each province the limits are disposed of at public auction, at so much bonus per square mile, subject to the payment of the regular annual ground rent or dues. The purchaser receives his title in the form of a license for the territory, each birth or limit comprising so many square miles of 640 acres. The license conveys simply the right to cut the timber on the territory therein described for one year, with the prior right to renewal annually in accordance with the prescribed regulations. The purchaser or licensee of a timber limit obtains no rights in fee to the lands covered by his license, but after securing his license at public auction pays a yearly tax for the privilege of cutting timber; and settlers who take up lands within the area mentioned in any license are not liable to be disturbed or prevented from clearing or cultivating land by the holder of such license. The yearly ground rent payable by limit holders is two dollars per square mile, and the transfer bonus one dollar per square mile.

DUES IN ONTARIO AND QUEBEC.

As before stated the timber dues in Quebec province are generally speaking slightly higher than in Ontario. For oak and walnut the dues are four cents per cubic foot in Quebec and three cents in Ontario; red and white pine, cedar and other square timber, two cents in Quebec, 1¼ cents in Ontario; five logs 13½ feet long, 17 inches, 22 cents each in Quebec, 15 cents each in Ontario; pine logs, 13½ feet long, less than 17 inches, 11 cents in Quebec, 15 cents in Ontario; spruce logs, 5½ cents each in Quebec, 10 cents in Ontario; pipe staves $7 per 1.000 in each province; West India staves, $2.25 per 1,000 in each province; boom timber, round or sided, pine or tamarac, 1 cent per lineal foot in Quebec, 1¼ cents in Ontario; pine for shingles 20 cents per cord in Quebec, 12½ cents in Ontario; cedar for shingles, 16 cents per cord in Quebec, 12½ cents in Ontario; cedar rails per hundred, 25 cents in Quebec, one cent in Ontario; cedar telegraph poles, 6 cents each in Quebec, one cent in Ontario; railway ties, 2 cents each in Quebec, 15 per cent *ad valorem* in Ontario; hemlock logs 6 cents each in Quebec, and 10 cents in Ontario; hemlock bark, 32 cents in Quebec and 30 cents in Ontario; hardwood logs and tamarac, 22 cents each in Quebec, 25 cents in Ontario; floors or birch (28 feet long) 25 to 30 cents in Quebec, 1 cent per cubic foot in Ontario. In addition to the foregoing provincial dues, export duties are imposed by the Dominion government upon the following classes of lumber when exported :—White and Norway pine saw logs, per 1,000 feet, board measure, $2 00; spruce and hemlock logs, per same measurement, $1.00; shingle bolts, per cord of 128 feet, $1.50.

LUMBERING OPERATIONS.

Large amounts of ready cash are required by all operators in lumber. In the early autumn months men and horses are engaged "to go to the shanties," that is to go and work cutting timber and logs upon the various limits.

The men and horses must be well housed and fed, in the woods, and all wages must be paid promptly. Immense quantities of provisions, flour, pork, potatoes, beans, tea, oats, hay, etc, must be purchased and shipped to the shanties, the cost of transportation to the distant limits being one of the principal items of expenditure. The construction of the Canadian Pacific railway has greatly reduced the cost of sending men and supplies to the shanties on the Upper Ottawa and tributary streams. A small army of shantymen are kept in the woods every winter by the Ottawa "lumber kings." The shanties in which the men live are usually built of logs, and are made as comfortable as circumstances will permit. In the spring when the snow melts the men usually come down the streams "on the drive," that is with the logs that they have cut during the winter, and are paid off, and go to work in the mills or seek other employment. The logs which are cut 13½ and 16½ feet in length are floated down the various streams to the mills. The regulation length of logs is 13 and 16 feet, but in running the rapids, the ends get "broomed," and so six inches additional length are allowed at each, and these ends are sawn off leaving each log smooth and square and proper length.

SAWING THE LUMBER.

Generally the best of the logs are cut into deals for the English market. These deals are three inches thick, ten feet and upwards in length and any width from nine inches upward. They are assorted into firsts, seconds, thirds and fourths, each class having its respective market value, and these grades only are exported, leaving an amount of inferior stock to be disposed of in the most profitable way possible. The balance of the logs are sawed into 10, 12 and 14 inch boards, which are generally exported to the United States. These stocks are culled and piled, according to the various grades. Great care is given to piling, the stocks being arranged in square blocks, single courses, very open. The immense piles of lumber on both sides of the Chaudiere never fail to attract the attention of strangers visiting Ottawa.

THE OTTAWA MILLS.

The immense water power furnished by the Chaudiere and Rideau Falls has been utilized to run a great number of lumber mills as well as some flour mills and cloth factories. The saw mills in this district are generally of large capacity, and are equipped with all the modern appliances for rapid, smooth and economical work. They are all "gang," and contain from four to eight gangs of from thirty-six to forty two saws each, with all the necessary edging tables, all lumber being made parallel and passed over chain butting tables. The lumber manufacturers of Ottawa are fully alive to the necessity of keeping abreast of the times and the necessities of the industry. The mills are run night and day through the short season if not over seven months. They are generally lighted by electricity, which aids materially in night sawing. About two-thirds of the sawn lumber of this district is produced at the Chaudiere and Rideau Falls Mills. Eleven hours a day constitute a day's work for mill hands and others connected with the manufacture and handling of lumber, and wages are paid weekly to mill hands and to men in the woods as their necessities and those of their families require it.

RATES OF WAGES.

The number of men who find employment in connection with the lumbering business in the Ottawa district is very large, being variously estimated at from ten to twelve thousand. There is of course no fixed rate of wages for any class of workmen, but the following statement as published by the U. S. consul here may be regarded as approximately correct.

Foremen in woods	$40 to $60 per month.
Choppers and skidders	15 to 20
Road Cutters	12 to 15
Teamsters and loaders	16 to 18
Cooks	30 to 40
Log measurers	45 to 50
Horse team and teamster	35 to 40
Mill foreman	" to 100
Head sawyer for gangs	40 to 45
" " for circulars	" to 60
Tail sawyers	30 to 35
Edgers and trimmers	35 to 40
Filers	50 to 60
General help, teamsters &c.	30 to 35

The wages paid to men in the woods are in addition to board, but men employed in and about the mills board themselves. The principal lumber mills of the city and district are those of Messrs. Bronson & Weston, Perley & Pattie, J. R. Booth, Grier & Company, E. B. Eddy, Hurdman Bros, at the Chaudiere Falls; Messrs. James Maclaren and McClymont & Co., at Rideau Falls; W. C. Edwards & Co., at Rockland; Gilmour & Co., on the Gatineau; James Maclaren and Ross Bros., at Buchingham; Hamilton Bros., Hawkesbury; Peter McLaren, Carleton Place; Boyd, Caldweel & Son, at Almonte, and other points on the Mississippi; W. J. Conroy, and E. B. Eddy at Dechene rapids; W. R. Thistle, Pembroke; McLaughlin Bros., Arnprior; Gillies Bros. Braeside. There are also a number of smaller mills cutting chiefly for home consumption.

The Biggest Book in the World.

"Just outside of London they are at work on the biggest book in the world," said a New York publisher, the other day, who has recently returned from a trip to England. "It will be more than four times as large as Webster's Dictionary, and will contain something like eight thousand pages. It is to be the ideal dictionary of the English language, and will supersede all pre-existing authorities. It has long been realized by scholars that the English language is deficient in this respect. The French have two dictionaries, that of M. Littre and of the academy, that are far superior to our own. The Worterbuch, of the German Brothers Grimm, is still more exhaustive and authoritative. Even the Portuguese dictionary, by Vieira, decidedly surpasses anything in English. But the British Philological Society proposes to fill this yawning gap in our reference books. They hold that a dictionary should be an inventory of the language, and that its doors should be opened to all words—good, bad and indifferent. This new work will not be confined to definitions and cross references. The life history of each word will be fully given, with a quotation from some standard writer, showing its shade of meaning and the variations in its usage from one generation to another."—*New York World.*

In Vancouver there is said to be a land office established in a hollow tree forty-four feet in circumference. In the same section there is a table forty one feet long and four or five feet wide, made out of a solid board.

Fort William *Echo*:—Fort William is the centre from which radiate all the great lumbering enterprizes of Algoma West. Each winter camps are established in every direction, and from the almost boundless timber limits which surround it the products of the forest are culled and prepared for their voyage to the Fort in the spring. Most of the timber employed by the C. P. R. Company in their many and vast enterprises is procured by companies having their headquarters here. From the mills of Messrs. Carpenter and Graham, and Horne & Co., it is an almost daily occurrence to see carloads of timber and lumber of all descriptions and dimensions proceeding east and west, intended either for the repair of old works or the construction of new ones. Customers for the manufactured material are found as far west as Calgary, and as far east as Sudbury.

THE CANADA

LUMBERMAN

PUBLISHED MONTHLY BY

A. G. Mortimer, Peterborough, Ont.

Terms of Subscription:

One copy, one year, in advance..... $1 00
One copy, six months, in advance..... 0 50

Advertising Rates:

Per line, for one year..... $0 75
Per line, for six months..... 40
Per line, for three months..... 25
Per line, for first insertion..... 10
Per line, for each subsequent insertion to 3 mo's. 04
Cards not occupying more than 12 lines (1 inch) per annum..... 8 00
Cards not occupying more than 12 lines (1 inch) for six months..... 5 00
Cards not occupying more than 6 lines per annum 5 00
Cards not occupying more than 6 lines, for 6 mo's 3 00

Special rates will be made for page, half page and column advertisements.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. NOV. 1, 1886.

WE expect a great rush of subscriptions during the next few weeks, as a result of our low offer for the balance of the year. Send in your quarter.

WE desire to secure active agents in every county who are willing to work on liberal pay to take subscriptions for the CANADA LUMBERMAN. Outfits and sample copies free.

THE September fire report for the United States and Canada shows that the fire bug, the small boy with matches and the hired girl and her kerosene can are still putting in their deadly work. Only $6,500,000 worth of property was consumed, but the annual aggregate this year will far exceed that of 1885.

THERE are increasing signs of an improvement in trade in England, and some branches already show a marked advance in prices, notably in wool, and to some extent in metals. Commercial reports from nearly all the large centres of industry are unanimous in stating that a more hopeful feeling generally prevails.

A new and plausible explanation of the destructive fires occurring in pine forests is offered. The pine resin exuding from the trees is often of lens shape, and before it thoroughly hardens frequently of crystelline clearness. It is surmised that while in that condition a resin lens may focus the sun's rays upon some light twig or resinous point and so start a blaze that quickly eats up a forest.

REPORTS from Ottawa are rather discouraging as regards the American demand for lumber. The state of affairs is principally attributed to the recent strikes in New York and other States. It is estimated that the stocks now piled at the Chaudiere, and which will likely not be removed this season, is greater than at any similar period during the past ten years. Owing to the labor trouble referred to industry was paralyzed for several months, the result being that American lumbermen were left with large supplies on hand. When the strikes ended they were unable to make as large sales as were expected, hence the accumulation at Ottawa.

A VALUABLE sale of timber limits took place at the Russell house, Ottawa, on the 19th Oct., there being a large attendance of capitalists. The limits in question are situated on the Georgian bay as per government map, being berths Nos. 6, 14, 15, 113, 186, 187 and 198, containing 36 square miles each; and those on Lake Nipissing, being berths Nos. 12, 20, 31 and 39, containing 30 square miles each. There were disposed of No. 6 to Mr. J. G. Bryson, at $11,300, No. 15 to Mr. David Moore, at $15.100, and No. 187 to A. & T. McArthur for $25,100.

PROMINENT shingle manufacturers in Aroostook, Me., say that the present arrangement of manufacturing Aroostook lumber in Americanized New Brunswick mills, taken in connection with the rates of freight for shingles from Aroostook to Boston, if continued, will drive every shingle manufacturer in upper Maine out of business. They assert, and give figures to prove, that lumber cut in Aroostook can be run to St. John or in the provinces, manufactured and returned to the States for from 20 to 25 cents cheaper than they can be made there and shipped by rail at present rates.

DURING the past month a meeting of gentlemen was held at Chelsea, Eng., for the purpose of testing the various qualities of different colonial timbers exhibited at the Colonial and Indian Exhibition. The object of the meeting was to bring together the leading civil engineers, timber merchants, builders and other users of wood, to meet experts from the various colonies and to witness the conversion of samples of the woods into railway sleepers, joinery, casks, spokes for wheels, etc. We have not yet learned the result of the investigation.

THE publisher of the CANADA LUMBERMAN desires to obtain a reliable and well-informed correspondent in every lumbering centre in the Dominion of Canada, and to that end would ask those disposed to act as such, to communicate the fact at once stating the facilities they possess for obtaining *reliable*, early and full information as to the lumber trade in their respective districts, and the remuneration which they will expect for their services as such correspondents.

MR. HOOPER, President of the Coachbuilders Guild, and member of the London Chamber of Commerce, has recently given some attention to an examination of the woods of Canada as shown at the Colonial Exhibition, As the outcome of his inspection, he is now visiting Canada to inquire into the possibility of obtaining direct from the Dominion the various kinds of woods used in carriage building. Mr. Hooper will spend some time in Ontario, where the chief supply may be met with, and will on his return read a paper on the subject before the Guild. Professor Macoun is also, we believe, to read a paper giving further details as to the qualities and uses of Canadian woods.

IT is curious to note that in the long list of national emblems there are but two trees, viz., the lime or linden tree for Prussia and the pomegranate of Spain. All other nations are represented by flowers or plants which do not rise to the dignity of trees. King Henry VII chose the hawthorn as his device, because the crown of Richard III was found in a hawthorn bush at Bosworth.—*Ex.* The writer of the above, although an American, evidently forgets that in Canada we have a tree which has long been considered an emblem of the country. We call it the maple, and have every reason to be proud of it.

FIRES, lumbering, tanning, wood pulp mills, charcoal, iron smelting, railroad building, all draw on the forest growth, and these are legitimate demands. Fires are the great causes of destruction of forests. In 1880, if the report presented by Prof. C. S. Sargent is reliable, the area burnt over in the United States was 10,250,000 acres, and the value of property destroyed $25,462,250. In the State of New York, according to the same authority, 149,491 acres were burned over, with a loss of something like $1,250,000. The largest number of these fires of any one class were traced to farmers clearing land and allowing brush fires to communicate with the forest. Locomotives are set down among the list of causes, as having set fire to woods 508 times, hunters 628 times, malice 262 times, clearing land 1,152 times.

FOR the balance of the year we will send one copy of the CANADA LUMBERMAN to any one sending us 25 cents. To new subscribers who will send us $1 we will mail the LUMBERMAN from now until the 1st of January, 1888. Every lumberman, saw-mill owner and wood-worker in the Dominion should accept this very liberal offer. As this is the only journal of the kind in Canada, and as we propose making it a thoroughly representative organ for the lumber and wood-working industries none can afford to do without it. Send us your money, and receive in return a paper which will keep you acquainted with the ins and outs of the trade, and especially a complete market report.

SOME idea of the extent to which mechanical ingenuity and efficiency have advanced may be had from the following statement:—"It is now possible to construct a complete sewing machine in a minute, or sixty in one hour; a reaper every fifteen minutes, or less; three hundred watches in a day, complete in all their appointments. More important than this even is the fact that it is possible to construct a locomotive in a day. From the plans of the draughtsman to the execution of them by the workman, every wheel, lever, valve and rod may be constructed from the metal to the engine intact. Every rivet may be driven in the boiler, every tube in the tube sheets, and from the smoke-stack to the ash-pan a locomotive may be turned out in one working day, completely equipped, ready to do the work of a hundred horses."

OF all the days in the week "Washing Day" is looked upon by the average house wife as the most disagreeable and least to be desired. Inventive genius, however, is coming to the rescue in this as in all other departments of labor, and what a few years ago took a whole day to accomplish can now be done in a couple of hours, and the heavy work of the operation almost entirely dispensed with. A reference to our advertising columns will show the merits of the Improved Washer and Bleacher, manufactured by Mr. C. W. Dennis, Toronto, Ont. This simple device has proved a surprise wherever introduced, and although weighing but four pounds, is so constructed as to do any kind of washing without injury to the finest fabric, and in a marvellously short time. The inventor has selected the LUMBERMAN as the medium to more fully introduce his machine to the public of Canada, and as far as our knowledge of this washer goes, we can recommend the same to the wives of our readers as the best article of the kind yet introduced.

CHURCHILL & SIM, (London, Eng.) in their October circular, show that the slight improvement which began to make itself felt in August has been maintained through September, foreign wood in particular having met with better demand at gradually advancing prices. There is an important reduction in the stock of foreign deals, and a large increase in that of colonial pine. The supply from Canada to the end of September has been:—Pine deals, &c., 1,549,000 pieces against 1,161,000 pieces in 1885; spruce, 1,051,000 pieces against 1,188,000 pieces in 1885; and from New Brunswick, &c.:—Spruce deals, &c., 344,000 pieces against 281,000 pieces in 1885; birch timber 2,000 pieces against 3,000 pieces in 1885. Spruce deals have been slightly reduced in stock. Pine has been sent in more liberally, and the stock compares unfavorably with that of last year. The variations in value have been unimportant. Timber generally remains unaltered. London is fairly supplied with all classes of Canadian timber; but the general demand is not satisfactory. Business during the month has been entirely by private sale.

THE "Toronto Permanent Exhibition of Manufactures" is something quite new for Canada, and when in operation will doubtless prove not only an interesting place to visit, but also a profitable place in which to do business. The scheme has been set on foot by Messrs. Nicholls & Howland of the Queen City, and a special building is now being erected which will be ready for occupation by January next. Some of the advantages likely to accrue to manufacturers are in brief as follows:—The exhibition will be free to all and open throughout the year. It will afford the advantages of a Toronto branch establishment at a very moderate cost. Competent salesmen will be in charge for the purpose of explaining the merits of each exhibit to interested visitors. Machinery will be shown in motion, and the whole establishment will, to all appearances, be a hive of industry.

"BEAUTIFUL Homes and How to Build Them" is the title of a little book just issued by W. B. Judson, publisher of the *Northwestern Lumberman*, Chicago. It contains a series of practical building plans, comprising something like 19 separate designs for modern frame and brick dwellings, a church and a public school. They were drawn by a prominent Chicago architect and are printed in five colours, making a strikingly handsome and attractive little book. The designs cover a very broad range of architecture, giving nearly all the prevailing modern styles, a remarkable feature of them being the fact that the publisher guarantees to furnish scale drawings, with full details ready to build, of any of the plans to purchasers of "Beautiful Homes," at a further cost not exceeding $3. The price of the little book is only 50 cents, and besides the plans themselves it contains much valuable technical information for both practical builders and people who desire to build homes.

FOR the kindly greetings extended the LUMBERMAN during the past month, by our Canadian and American exchanges, we beg to extend our thanks. Kind words do much good, and every reference to our paper from different parts of the country, has a very desirable effect. It is the intention of the publisher to make the LUMBERMAN, both in point of technical interest and typographical appearance, second to no other trade publication in the Dominion. One step has been taken towards this end in adding an attractive cover to the present issue. Next month we propose introducing a fine toned paper throughout; and so improvements will go on until the desired excellence has been attained. We solicit the co-operation of every reader to further this end. If you do not feel equal to writing us something of interest occasionally, you can do a good work by handing a copy of the paper to a friend, and securing his subscription to the same. Stir up, and let us have a grand rush of new subscribers for the coming year.

EVERY mechanic and business man should know the journals especially intended to advocate his respective branch of industry or trade. Aside from the numerous books on the kindred arts, there are many journals published that might and ought to be of great service to the wise craftsman who read them, for there is hardly a single issue of one of them that does not contain a greater or less number of items which would afford a better knowledge of some part of the business to which they have given their time and attention, and through which they gain their livelihoods. Even the advertisements—especially if they be of new material, new machinery, or new processes—contain information well worthy the attention of every one who would better himself, or the craft of which he is a member. Every paragraph which gives an insight into other people's modes of doing business, or which calls attention to new inventions and discoveries, or new uses of old facilities is worthy of study and preservation. The assertion that one "cannot learn from books," is disproved by even a careless examination of any of the numerous trade journals published in America, and the mechanic, master or workman, who would keep himself abreast of the world's progress in his own branch, must give them careful attention. We hope that every lumberman and wood-worker who receives it, will not only read and preserve the successive issues of the LUMBERMAN, but also those of all other similar journals he may be so fortunate as to obtain. They will, in years to come, be even more valuable than now, and, like new friends and new wine, improve with age.

EXCHANGE ECHOES.

Contemporary Opinion on the Various Matters of Interest to the Trade.

Saw Mill Gazette

THE chief timber exporting countries of Europe are Norway and Sweden. From Norway 80,000,000 cubic feet come annually, half of them to England; and 33,000 men are at work in the forests and in the timber and wood-work trades in connection therewith. Large as is this production, it is under control; and no tree is now cut unless another is planted; and only enough are cut to keep within the period of rotation. This country might take a valuable lesson from this, and in time will probably see the necessity of doing something to keep up the supply.

Lumber World.

LUMBER lore is being revised every day by the same class of minds that have decided there never was a William Tell who shot an apple from his son's head, never a Lucrezia Borgia who beguiled her hours in administrating fatal poisons to her casual friends, and never a Washington who refused to lie about the hatchet and the discombobbolated cherry tree. It has lately been demonstrated by these minds that the southern pine is not the native heath of the festive and nocturnal bedbug, that the bark on the north side is not thicker than that on the south side, and that the age of the tree cannot be even approximately judged by the number of rings visible in its trunk. Thus do cherished traditions disappear in the light of science!

Northwestern Lumberman

A CORRESPONDENT makes inquiries as to the best way to pile shingles. Some manufacturers lay the bunches flat, others on the edge; and without being able, perhaps, to give any specific reason that would convince others why the latter is the better, the LUMBERMAN gives it the preference. In either case it is better to use long strips than short ones between the different layers, for by so doing the whole pile is strengthened and less liable to be blown over, or from other causes tumble down. A space of a foot should be left between the piles so as to assure a free circulation of air. No shingles are half piled that are not covered. Especially if the bunches be set edgewise, if a rainstorm strikes them before they are roofed the top bunches will be wet clear through. Ordinarily a manufacturer on a moderate scale carries his piles up ten or twelve feet.

Timber Trades Journal, (London, Eng.)

Although a few isolated transactions may still be expected to take place, we may, nevertheless, consider f.o.b. business as practically at an end for this season. Buyers, both in London and on the coast, look forward with equanimity to passing through the winter with light stocks, adhering to the conviction which they have expressed throughout the summer, that no immediate improvement in the inland timber business is to be expected for some time, in spite of the admittedly better feeling in other branches of the trade. Shippers and their agents still endeavor to prove that stocks must run short, and prices consequently rise considerably during the next few months. But buyers remain absolutely indifferent, replying that in such case they be well content to realize a larger profit on a smaller quantity rather than run the risk of holding unwieldly stocks. The anticipations, therefore, of an active autumn trade seem likely to be falsified, more especially as all chance of a brisk business has been destroyed by the advance in freights, which prohibited fresh f.o.b. or c.i.f. transactions. Most of the chartering now effected is for goods contracted for, and we understand that the amount of tonnage taken up on consignment or speculative account is considerably smaller than usual. This will prove of especial benefit to the London market, where the present stocks, as far as we can judge, will prove amply sufficient for any legitimate demand likely to be made upon them.

The Timberman, (Chicago.)

A comparison of the stock on hand in this market on the 1st inst., with the amount held one and two years ago on the said date, makes a very significant showing. It bears out fully the position THE TIMBERMAN has taken that there is much less lumber here than it has been the habit of the trade to have in pile at this time. As contrasted with last year, the shortage is 67,982,431 feet, or about twelve per cent. of the total, while as against 1884 there is a difference of 95,227,733 feet or about sixteen per cent. These figures show that the market is not accumulating stock as rapidly as it usually does toward the close of the season, and therefore that there is little chance that it will recover any of the present shortage; it is far more likely that the amount it is behind will increase with each report. The receipts are running from ten to fifteen per cent. below last year, and with the present low range of cargo prices, and the high and increasing cost of transportation, there is nothing to induce mill men to push forward anything for which they can find piling room at the mills. There is an explanation in the facts of the complaints which are prevalent of a short supply of many grades of lumber at the yards, and a hint of what may be expected in the future. There can be no question but that nearly all the shortage indicated by the comparisons above made is in the grades of stock that are in best demand, and which are hardest to find—long piece stuff, fencing, and common and cull boards, with a few items among the better qualities of lumber.

The Timberman.

Predictions in respect to the condition of lumber prices in the early future are heard now and then, and as usual there is a notable difference of opinion among the prophets. Some rather careful students of the business conditions affecting the lumber trade, hold, and are not afraid to express, rather sanguine views of the outlook. Basing their opinions upon the improved and improving condition of general business, the active demand for labor, and the evident shortage in the lumbor supply, they think they are able to see, just ahead, the opportunity to sell lumber for more than it is now bringing. Less optimistic observers consider the low price of grain, and the condition in which it places a large number of lumber buyers, and are inclined to be somewhat doubtful of the result. It is certain that the market generally, despite the admitted and increasing shortage of dry stock, does not show the strength that should precede an advance in prices. The reason of this is largely that the demand has not been as brisk as was anticipated, and it is possible that even a little improvement therein, of which the better reports received of the past week's trade raise some hope, might result in changing the appearance of things markedly. It is not easy to see how the limited stock of many items in sight for the fall and winter trade, can fail of producing upon values the legitimate effect of a supply that is less than the demand. For such things, at any rate, if not for all grades and kinds of pine lumber, it would seem that higher prices should soon obtain, simply in accordance with the well known principle which is universally admitted to govern their rise and fall.

WHAT THEY SAY OF US.

THE CANADA LUMBERMAN is still published monthly by Mr. A. G. Mortimer, of Peterborough, and is devoted to the lumber and wood-working industries of the Dominion. It is a valuable technical journal.—*London Free Press.*

THE first issue of the CANADA LUMBERMAN under its new management clearly indicates that Mr. Mortimer has not missed his calling, and that the Dominion is going to have a newsy exponent of the lumber trade. Success to it.—*Chicago Lumber Trades Journal.*

MR. A. G. MORTIMER, who has for many years been connected with the *Mechanical and Milling News*, has assumed the proprietorship of the CANADA LUMBERMAN, which will hereafter be issued on the first day of every month.—*Deseronto Tribune.*

THE CANADA LUMBERMAN published at Peterborough is now under the editorial and business management of Mr. A. G. Mortimer. The LUMBERMAN is a good trade journal, and should meet with success.—*Bobcaygeon Independent.*

THE CANADA LUMBERMAN published at Peterborough, Ont., has been sold by the Peterborough Review Printing and Publishing Company, Limited, to A. G. Mortimer. The paper has been published semi-monthly, at $2 a year, but now it will be made into a monthly, the subscription price being placed at $1.—*N W. Lumberman.*

THE CANADA LUMBERMAN has been purchased by Mr. A. G. Mortimer, an old office mate of the editor of the *Star*, who has changed the paper to a monthly, and has reduced the subscription price to $1 per year. We wish him every success in his new undertaking.—*Parry Sound Star.*

THE October number of the CANADA LUMBERMAN is undoubtedly the best copy of that journal which we have yet received. Every person interested in the lumber industry of Canada or the preservation of our forests should subscribe for the LUMBERMAN.—*Deseronto Tribune.*

THE CANADA LUMBERMAN, hitherto published by the Peterborough Review Printing Co., will hereafter be published by Mr. A. G. Mortimer, of the *Mechanical and Milling News*, on the 1st of every month, at $1 a year. The LUMBERMAN will now be in good hands.—*Uxbridge Guardian.*

THE CANADA LUMBERMAN, published in Peterborough, we are pleased to notice, continues to flourish. Is the only journal in the Dominion devoted to the lumber and wood-working industries, and should find a ready patronage from wood-workers and those connected with the lumber interest.—*Port Hope Times.*

We are pleased to notice that under its new management the CANADA LUMBERMAN is being enlarged and improved in many ways. Mr. Mortimer seems to have the correct idea of how to conduct a trade publication, and one of his first improvements has been the addition of an attractive cover to be followed by the adoption of a fine toned paper throughout. We wish our successor every success that his enterprise merits.—*Peterborough Review.*

THE CANADA LUMBERMAN now in its seventh year, has passed under the editorial control and business management of Mr. A. G. Mortimer, who has had considerable experience in the management of trade journals. The LUMBERMAN contains several special features of much value to those engaged in the lumbering business and promises, by its trade reports and attention to the interests which it represents, to be an indispensable periodical.—*Ottawa Journal.*

A. G. MORTIMER, brother of the publisher of the *Dominion Mechanical and Milling News*, has purchased the CANADA LUMBERMAN from the Review Printing and Publishing Co., of Peterborough, Ont., and will hereafter conduct it as a monthly journal. The subscription price, which, as a semi-monthly, was $2 per annum, has been reduced to $1. Under its new management we hope to see the LUMBERMAN live and prosper.—*Dominion M. and M. News.*

THE CANADA LUMBERMAN, published monthly by Mr. A. G. Mortimer, at Peterborough, Ont., is one of the best trade journals in the Dominion. As its name denotes, it is devoted chiefly to the discussion of matters affecting the lumber trade of Canada, in all its branches, from getting the logs out of the forest till they are ready to be put on the market in various manufactured states. It is a large 16 page journal, now in its sixth volume, and has so far deserved success that its publishers have decided on introducing several improvements in its make-up, commencing with the next number.—*Montreal Gazette.*

OUR Canadian cotemporary, the CANADA LUMBERMAN, published at Peterborough, Ont., has been purchased by Mr. A. G. Mortimer. Under the new management the LUMBERMAN will be issued on the first of each month, and the subscription price will be $1 a year. Mr. Mortimer has made himself known in Canada by his connection with the Toronto *Mechanical and Milling News*, and his experience in trade journalism will enable him to keep the LUMBERMAN at a high standard of excellence as a news journal and an advertising medium.—*Lumber World, Buffalo, N. Y.*

AMONG the many other new advertisements which appear in this issue of the LUMBERMAN we have much pleasure in referring to the one occupying the last page of the cover, that of the Dodge Wood Split Pulley Co., 81 Adelaide St. West, Toronto. The special advantages of this style of pulley can be briefly summed up as follows:—The compression fastenings of wood on iron, with wooden bushings, will hold this pulley firmly upon the shaft, and is, in a majority of cases, better than an iron pulley, from the fact that it can be made lighter, and thus save weight on the line shaft, and bearings, thereby reducing friction. It is a well known fact that a wooden pulley is better than an iron pulley, from the fact that it holds a belt much better. From the best authority, this latter amounts to at least 33 per cent. The manner of fastening the pulley to the shaft does not mar nor injure the shafting in the slightest degree, and therefore does not tend to throw the pulley out of balance, as the tendency is with pulleys secured by keys and set screws. The pulley is built of wooden segments, the face being made of poplar. The two halves of the pulleys are secured to the shaft with eight bolts. The bushings to fit different sized shafts are made of hard-wood, thoroughly air-dried, then bored and kiln-dried; then each bush is counterbored to exact size of shaft, then carefully turned on the outside to fit the bore of the pulley. They are then cut transversely in halves. Any further information regarding these pulleys will be cheerfully furnished by the manufacturers.

THE BRITISH WHIG

The neatest Daily in Canada, bright and newsy, $5 by Mail.

THE WEEKLY WHIG

Rivals Toronto and Montreal papers, giving a better selection of general news, fair and independent.

ONLY $1 TILL END OF 1887.

The Whig has a larger circulation than the three other Kingston journals combined. It pays always to advertise in the best.

E. J. B. PENSE, Proprietor.

GEORGE GALL

WHOLESALE and RETAIL

HARDWOOD LUMBER

MERCHANT

Car Lots sold on Commission, railway switch in to yard and plenty of room for storage. Yard corner of Stachan and Wellington Ave. Office, 9 Victoria St. Telephone Connection.

A SPLENDID

MILL SITE FREE.

Adjoining Village and new R. R. with Fifty Million feet of Pine and One Hundred Million feet of Hardwood within radius of ten miles, is fifteen miles from any other mill. A great opportunity to the right man. Mill site of eight acres given free to party who will erect mill or manufacturing establishment. Address

C. T. KENNAN, Milwaukee, Wis.

GRATEFUL—COMFORTING.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast table with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—"*Civil Service Gazette.*"

Made simply with boiling water or milk. Sold only in packets by Grocers, labelled thus:

JAS. EPPS & Co., Homœopathic Chemists. London, England

General News Notes.

PEMBROKE is to have a new machine shop and foundry.

THE new mill at Canning, Ont., is in operation again.

J. C. BLAKNEY, saw mill owner, Elgin, N. B., has assigned.

EDWARD BURNS, lumber dealer, Hamilton, Ont., is dead.

JOHN MCALLISTER, lumber dealer, Windsor, Ont., is dead.

THE International Tent and Awning Co., Ottawa, has assigned.

BUILDING operations are reported brisk at Edmonton, N. W. T.

BRITISH COLUMBIA shingles have been shipped as far east as Calgary.

IT is said Rathbun intends starting a sash and blind factory in Piction.

J. A. KILLAM'S saw mill at West Brook, Nova Scotia, was lately destroyed by fire.

A NEW saw mill has been started a short distance from Calabogie, Ont., by Mr. A. Grant.

SAW MILLS round about Ottawa are shutting down earlier this year than usual, owing to a scarcity of logs.

THE Canadian Pacific Company is building five miles of snow sheds in the Rocky mountains at a cost of $1,500,000.

IT is estimated that nearly 10,000,000 feet of lumber will be required at Duluth for elevator building before next fall.

A DESPATCH from Byng Inlet says:—A saw log drive of over ten million feet has been struck twenty miles up the Magnettawan River, for want of water.

MR. CHAS. LOUTLIT, manager of Gilmour & Co's saw mills at Crow Bay, reports having cut over one million feet of lumber this season. The sales have been as large as last year.

A YEAR ago box-wood found a ready market in the United States at $100 a ton. Now the market is dull at $20. The bursting up of the skating-rink bubble did the business.

MR. JAMES MARTIN has purchased the sash and door factory on Fifth St. Collingwood, Ont., from Mr. McKean. He has also a factory on Hurontario Street, in the same town.

OWING to a break-down of some of the machinery the Midland and North Shore Lumber Company's steam mill at Parry Sound, had to be closed down for the season on the 6th, Oct.

THE wood-working shop of O. Goulette, at Gananoque, Ont., occupied also by P. O'Hearn, for wagon making, was burned Sept. 29th. The property was insured for $5,400 which covered most of the loss.

A meeting of the Council of the Board of Trade will be held soon at Toronto, to consider the purchase of the site for a new building. The American Hotel site is spoken of at a cost of $55,000. A building to cost $300,000 is mentioned.

MESSRS. S. J. HOGG & Co., recently received the first consignment of lumber from New Westminister that has been brought to Calgary. The lumber is very clear stuff and can be sold at about half the price charged formerly for this class of lumber.

TRADE prospects in England are brightening. The stocks on hand are nearly 750,000 loads short of the supply last year at this time. Unless there is a remarkable influx to fill up the deficiency, trade is likely to become more active and prices stronger.

THE last issue of the LUMBERMAN contained a sketch of the wood-working industries of Brockville, among which was mentioned the planing mill, and sash factory of Messrs. Kerns & Co. We have this month to chronicle the destruction of these works by fire. The loss is heavy.

THE Campbellford *Herald*, says:—Two carloads of railway ties were daily shipped from the Rathbun saw mill during last week and the week previous. The mill will be kept running at its greatest speed to complete the work undertaken this season. The frost will close operations there in a few weeks.

THE growth of the lumber trade of the Australasian colonies has been extraordinary within the last few years. The total quantity of rough and finished lumber imported into New South Wales alone during the year 1885 was 65,822,037 feet, valued at $2,296,760, against 49,608,825 feet, valued at $1,903,900 for 1884,

A SYNDICATE of well-known Montreal citizens have bought the mills and limits of L'Assomption Lumber Co. from the Exchange Bank liquidators for $30,000, and propose running the mills again. The area over which the purchasers have a right to cut timber embraces three hundred miles, part of which is situated at Ste. Julienne.

THE Chicago *Herald* says:—"G. W. Sheldon & Co. entered the first cargo of foreign lumber received at this port for many years yesterday. The cargo contained 200,000 feet of pine and ash lumber from St. Joseph Island, Canada, to Hitchcock & Foster, Chicago. The duty is $2 per thousand feet, and that is what has made it unprofitable to import."

Kingston *Whig*: Yesterday Mr. McRossie went to the Cape to see the base ball match. He combined business with pleasure and purchased the machinery belonging to Mr. A. G. Burnham's saw mill. It will be brought to the city and removed to a point, not yet selected, beside the Kingston & Pembroke railway. where Mr. McRossie intends erecting a saw mill.

INFORMATION is wanted concerning the whereabouts of one Patrick O'Connor, about twenty-five years of age, brother of Daniel and John O'Connor. He followed lumbering around Orillia and Gravenhurst, working for Geo. Cox about eleven years ago; boarded at the Cooper House. Any information will be thankfully received by Daniel O'Connor, Cavalier P. O., Pembina Co., Dak., U.S.

MR. LOUIS BRITTON, of Parry Sound, was recently severely injured by the falling of a tree in one of the Conger Lumber company's camps. While walking through the woods on the edge of a lake he was struck by a falling tree, which knocked him into the lake, and but for the prompt aid of a person who was near him he would have been drowned. As it was several ribs were broken, and he was otherwise badly bruised.

MONTREAL is likely to increase materially its export of timber by the opening up of the great railway thoroughfare westward, as 3,500 carloads of square timber, representing 2,000 square feet, have arrived in Montreal within the last two months over the Canadian Pacific Railway from the Georgian Bay and Lake Nipissing districts. These consignments were formerly sent down by water at a much slower rate of progress. If cubic feet are understood, this would foot up to 40,000 loads.

WM. WHITNEY, of Bay City, Mich, is preparing to start lumbering operations on his recently purchased land in Canada. He will run one camp on the Restole river, a branch of the French river, sixty miles from Georgian bay The cut will be from eight to ten million feet. The present calculation is to take the logs to Bay City to be sawed. Men and camp equipments will be taken from Bay City. Mr. Whitney's mill at Point Lookout has cut 3,000,000 feet this season.

ON the night of Oct. 14th a fire broke out in the saw mill of the Port Arthur Lumbering Co. The flames had made considerable headway before being discovered, and in a very brief space of time the whole building, full of inflammable material, was ablaze. Two engines were soon brought into service, and were kept at work for some hours. A good deal of anxiety was felt at first for the safety of the immense piles of lumber in the immediate vicinity, but the flames were prevented from spreading from the mill in any direction, and not a foot of stock outside the building was destroyed. The cause of the fire is not known. The mill was running during the day and when closed down was believed to be in a safe condition. It is supposed that the flames originated from a spark near the engine room, and smouldered for some hours unobserved. The mill, stock and machinery was insured for $8,500 as follows:—Western $2.125, Queen $2,125, Citizens $2,125, and Commercial Union $2,125. The loss is estimated at $15,000.

THERE are about 34,000,000 acres of forests in Germany, Prussia, containing 20,000,000 acres. The estimated value is $2,500,000,000 and they bring in an annual revenue of $50,000,000. The state forests are taken great care of in all parts of Germany; in Prussia alone $500,000 a year is spent in replanting, yet the imports exceed the exports by 2,000,000 tons. The oak and the beech are the kinds of trees which do best in Denmark, but the timber trade in that country is very small.

FOR the seven months ending July 31, 1886, the imports of sawed lumber into the United States amounted to $2,743,755, against $2,883,651, for the corresponding period in 1885. The total imports of wood amounted to $3,794,704 in 1886 against $4,122,093 in 1885. The exports of boards, deals and planks for the first seven months of 1886 were $3,995,411, against $3,995,411, against $3 651,395 in the corresponding part of 1885. The total exports of wood and articles manufactured thereof amounted to $12,967,412 in 1886, against $12,031,673 in 1885.

THE Kingston *Whig* says: There is a rumor afloat to the effect that the Caldwell's are going to stop lumber cutting and close their yard in this city. It is untrue. Lumber cutting is always stopped at this season, but only for the winter, and next summer will see the mills again in operation and doing effective service. The yard here is a success, and the citizens would be very sorry to see it closed. Mr. Frank Scantlon has made the business hum, and it cannot be said of him or the agency, "They never would be missed."

THE Cedar Mill at Deseronto, still continues very busy. Mr. Bick, of Bobcaygeon, well known throughout Canada and the United States, for his skill as a manufacturer of shingles, has taken the position of superintendent of the shingle department. The tie contracts for the several railway lines has been the most busy in the history of the mill. Some 400 pieces of excellent timber have been shipped to build piers at the Murray Canal. Several large shipments of shipbuilding material have been made to Kingston and other points and a quantity of timber is now being shipped for the Grand Trunk.

A gentleman from Tonawanda, who has been up the Huron shore, says more lumber is marked up at Alpena and Oscoda as sold than he has seen at this season of the year in the last 15 years. He said the Churchill Bros. had a quantity of fine logs and asked $24 for the lumber to be cut therefrom. They were offered $23, but declined to take it, which the gentleman regarded as a good indication of the strength of the market. It may be said that the choice grades of lumber have readily commanded a high price during the entire season, and there is a demand for more of it than the mills have manufactured. Really choice lumber is growing scarce.

AN important sale of timber limits recently took place at Ottawa. The first put up was twenty square miles north side of the Ottawa River of License No. 240 of 1885-6, Province of Quebec, the adjoining berth 16 square miles of License No. 241 of 1885-6, Province of Quebec. This was knocked down to Mr. Gormully for $30,400. The next parcel, forty-five miles on the White Pine River of License No. 242 of 1885-6, Kippawa, Province of Quebec, was sold to Mr. E. B. Eddy for $18,300. The last lot, twenty-four square miles, south side of the Ottawa River, of License No. 97, 1884-5, Province of Ontario, was sold to Mr. H. H. Dickson of Pakenham, for $7,500.

RAILWAY NOTES.

IT is reported that the Grand Trunk will commence at once the construction of the Sault Ste. Marie extension from Gravenhurst to the Sault.

A party of Canadian Pacific railway directors intend erecting a mammoth hotel at the Baniff National Park, Manitoba.

ON October 1st the Canadian Pacific railway took over from the Dominion Government the telegraph system in British Columbia, and will hereafter work it as part of the company's service.

MESSRS. Dan Mann and Tom Holt, both old contractors on the Mountain Division of the C. P. R. have secured the contract for building the first 40 miles of the Hudson Bay railway.

THE British railways only killed one passenger in each 6,000,000 carried last year. That shows careful railroading.

THERE are in the United States 340,000 miles of completed railway, not including the side tracks. Much of this vast aggregation of road was built at a cost of $6,000,000,000

Trouble in the Head.

Roaring sounds and whistling in the ears and deafness. I had been much troubled by roaring and singing in my ears and at times a whistling sound, especially when lying down, writes a correspondent of the Boston Transcript. An old and experienced physician whom I consulted told me to gargle my throat night and morning with hot and cold water. Have one tumbler of hot water, taking the water hot enough to scald the mouth, and one tumbler of cold water. Gargle first three times with the hot, then three times with the cold water. Do this three times making nine times with each. In a short time I was cured by this very simple remedy. Many times I have wished it were better understood how often deafness is caused by the hardening wax in the ear. A great number of people doubtless suffer from what they believe is incurable deafness, old persons in particular supposing it to be caused by old age, when if they would consult any good aurist they would find it was merely hardening of the secretion of wax in the ears. They can generally be removed by a very simple operation and hearing restored.

HEMLOCK BARK.

The supply of hemlock in Lower Canada will be exhausted, so far as a practical supply is concerned, much sooner than most people think.

It is a fact not known to the average reader that the supply of hemlock in the Eastern Townships, of Canada East, so-called, is practically exhausted. Notwithstanding the immense hemlock forests which existed there twenty-five years ago, the ruthless hand of the destroyer has levelled those great hemlock forests. Very little of the lumber was marketed at the time the bark was peeled, as it would not pay the transportation bills. Hence, millions upon millions of hemlock logs have rotted on the ground in Canada during the past twenty-five years.

Twenty-five years ago Mr. Cutting, of Winchester, brought in the first carloads of consequence from the Eastern Townships into Massachusetts. At that time he only paid $1.50 to $2 per cord for bark peeled, dried and hauled to the line of the railroads in Canada.

This was a very low figure, and afforded the buyer more profit to the carload then than can be made from half a dozen carloads now. It seemed at that time as though the hemlock forests of that part of Canada could never be exhausted, but to-day the great tanneries erected there twenty years ago are idle and are rotting down, merely because a supply of bark cannot be procured.

When the great tanning firm of F. Shaw & Co., established its tannery at Waterloo, Ont., they bought thousands of cords of bark delivered at their tannery at $1.25 to $1.50 per cord. This, of course, gave them a great advantage over those tanneries operated at a great distance from the base of hemlock supplies, but that advantage is fast waning, and but a limited number of tanneries can be run in Canada at the present time. Even the great hemlock extract companies, which were located in the heart of the hemlock districts, have been closed, with the single exception at Upton. Never was a great hemlock forest fooled away at no profit to any one as was the case in the Eastern Townships of Canada. The French habitant who felled his hemlock trees, who peeled his bark, who piled it to dry, and who the subsequent winter hauled it to the railroad, getting only $1.25 to $1.50 per cord, did not realize twenty-five cents per day for his own labor.

The supply of available hemlock is so small at present that the subject is really one of startling importance, both to tanners and owners of hemlock lands. A thorough investigation of the subject is necessary and important. The area of hemlock lands was never nearly so large as that of spruce or pine, and bark is an article which can only be transported by teams or railroad. It cannot be marketed as ordinary logs can, by rivers and streams.

Useful Information.

HOT AIR, drawn over steam pipes that are heated by exhaust or live steam and then blown through pipes to various points where it escapes, is a satisfactory method of heating shops.

IT is argued that pulp can be used as a substitute for lumber in articles now made exclusively of wood. By mixing the pulp with clays, steatite, asbestos, plumbago and mica, substances of every possible color and compactness may be produced.

THE *Chronique Industrielle* gives the following recipe for a paste that will remove the rust and not scratch the finest polished surface: Cyanide of potassium, 15 grams; soap, 15 grams; chalk (blanc de Meudon), 30 grams; water, sufficient to make a thick paste.

ACCORDING to the *Moniteur Industrielle*, a mixture of oil and graphite will effectually prevent screws becoming fixed, and, moreover, protect them for years against rust. The mixture facilitates tightening up, is an excellent lubricant and reduces the friction of the screw in its socket.

FOLLOWING is a comparative statement of the toughness of various woods: Ash, 100; beech, 85; cedar of Lebanon, 84; larch, 83; sycamore and common walnut, each, 68: Occidental plane, 66; oak, hornbeam and Spanish mahogany, each, 62; teak and acacia, each, 58; elm and young chestnut, 52.

THE soundness of lumber may be ascertained by placing the ear close to one end of the log, while another person delivers a succession of smart blows with a hammer or mallet upon the opposite end, when a continuance of the vibration will indicate to an experienced ear even the degree of soundness. If only a dull thud meets the ear, the listener may be certain that unsoundness exists.

REMOVING FURNITURE BRUISES.—Wet the part with warm water; double a piece of brown paper five or six times, soak it and lay it on the place; apply on that a hot flat-iron till the moisture is evaporated. If the bruise be not gone, repeat the process. After two or three applications, the dent or bruise will be raised level with the surface. Keep it continually wet, and in a few minutes the bruise will disappear.

WHEN a band saw has been dressed for the silver solder, take a clean piece of borax, wet it and rub on the parts of the saw to be joined. Then pulverize a little of the borax and sprinkle on the solder, first wetting the same; place this between the ends of the saw and sprinkle a little borax on top of the saw. Now heat the tongs to cherry red and clamp them on the saw for one minute; then pour on a little water and take the tongs off.

DYNAMITE FOR PILE-DRIVING.—An Engineer of Pesth, Mr. Pradanovic, has lately used dynamite for driving piles. A circular cast iron plate 15 inches in diameter and $3\frac{3}{4}$ inches thick is fixed on the pile to be driven in a perfectly horizontal position. A dynamite cartridge made in the form of a disk 6 inches in diameter and $\frac{3}{4}$ of an inch thick and containing $17\frac{1}{2}$ ounces of dynamite is placed upon the cast iron plate and exploded by electricity. It is stated that the depth to which the pile is driven by each explosion is equal to five blows of an ordinary pile engine weighing $14\frac{3}{4}$ Vienna cwt. falling 9 feet 10 inches. A cast iron plate on an average resists 25 explosions.

AN eminent German physician recommends for the extinguishment of fires in closed places where the use of water or other liquids would be likely to do great damage, a dry compound, which, by its burning, absorbs the oxygen and quickly renders combustion impossible. The compound is composed of powdered nitrate of potash (saltpetre), 59 parts; powdered sulphure 36 parts; powdered charcoal, 4 parts; colcotha, (brown-red oxide of iron), 1 part. This preparation is one that can be cheaply made. It is recommended that it shall be, when thoroughly dried and mixed, put up in tight pastboard boxes, holding about five pounds each, with a quick fuse in the side of the box—protruding six inches, with four inches inside—to facilitate and insure lighting it.

THE TRANSMISSION OF POWER.

Power in various forms, and multiplying as the years increase, has always existed, and been used by mankind. History, however, brings us very few facts along the line of mechanics, and it is therefore difficult to say *when*, *how* or *where*, any special form of power or method of transmission originated—at least, this statement is entirely true, if the last two centuries be not taken into account.

In his excellent work on "Hydraulics and Mechanics" Sir Thomas Ewbank remarks, "Tradition has scarcely preserved a single anecdote or circumstance relating to those meritorious men with whom any of the useful arts originated: thus nearly all knowledge of those to whom the world is under the highest obligations, has perished forever."

Probably the earliest power used—outside and apart from human and animal physical strength—was the power of the wind, followed, probably, very closely by the use of water power; and these four powers: human strength, animal strength, wind-force and water-weight, were humanity's powers for over fifty-seven centuries of this world's history. In the application of these powers, for practical, useful, or necessary purposes, transmission of power began, and from the very crudest beginnings, by slow processes of development, along the line of necessity, came the lever, the inclined plane, the wedge, the screw, the wheel and axle and the pulley, all in their place, and by a proper application and utilization of their advantages, becoming means for the transmission of power.

Let me be clearly understood here. I mean just what I say. The lever, &c., have been called from "Times dim morning" mechanical powers; but having no inherent strength or power, are they not (and can they ever be anything else, either separate or in combination) means for the transmission of force, or power in motion?

Ganot defines "power" to be that force which acts to produce motion. Power in motion, therefore, implies the use of *means*, or *matter*, and as a consequence, *results*, and I think we are safe in assuming every construction or machine, and every use of the lever, pulley, wheel and axel, wedge, &c., to be a means for the transmission of power; and whether the machine be of such a construction, (the Webb printing press for instance), as to contain within itself a combination, to a great extent, of all the mechanical forces, or a simple paddle in the hands of a conceist, the fact remains the same, that the material made use of is a means for the transmission of power. And however varied the results may be, caused by the combination of these forces in the mechanical construction made use of it, the fact remains that in all these forms, the true purpose and aim of the users in the varied combinations is the transmission of power. With the introduction of steam, about the year 1768, a new power was added, and as a result the means and constructions for the transmission of power have been broadened and widened, still along the line of the mechanical forces, however, until the methods and combinations for the transmission of power have been multiplied to such an extent that volumes might be written, if one desired to go into details along the lines used.

In the transmission of power, from the motor—or power producer—in connection with the manufacturing industries of the world, during the seventeenth, eighteenth, and the greater portion of the nineteenth centuries, gearing was used almost exclusively; and many of our present engineers can remember the time when it would be considered heretical (in a mechanical sense) to even suggest the propriety of driving a line of shafting, or the machinery connected therewith, by any other means than gearing. Younger generations, however, not bound by the prejudice that entrammelled their fathers, nor hindered by the wisdom (?) of school-made "mechanical engineers," pushed by keener competition into developing the most available out of all their resources, have not hesitated to experiment along new lines, to compare the new with the old, and to adopt the better. As a result of this investigation and comparison by practical men, instead of noisy gearing for the transmission of power, belting and pulleys are now used almost exclusively, and latterly, in a few instances, sheave pulleys and an endless rope.

Gradually, within the last few years, another power—electricity—is coming on to the scene. As yet being used, partially, as a means of transmitting power, and more particularly as a light producer, and not being self-productive, nevertheless, the indications are, that before many decades shall have passed, by the perfecting of the means of producing, controlling and conveying electricity, radical changes will be made in many of the important methods of transmitting power.—*L. A. Morrison, in Dominion M. & M. News.*

UPPER OTTAWA IMPROVEMENT COMPANY'S OPERATIONS.

The Upper Ottawa Improvement Company was incorporated in the year 1868, for the purpose of acquiring and constructing improvements on the Ottawa River to facilitate the transmission of timber and logs from the Des Joachims Rapids to Ottawa. The company proceeeded to purchase and construct booms at Fort William, Des Joachims, Allumette, Melons, Chenail, Lapasse and Onio, and also between the head of Dechenes Rapids and Ottawa and at the outlet of the Hull slide. The paid up capital stock of the company is $108,000, and the present directors are Messrs. Hiram Robinson, E B. Eddy, E. H. Bronson, C. B. Powell and James Gordon. Mr. Robinson is President of the company, Mr. J. R. Booth, Treasurer, and Alderman G. B. Greene, Secretary. The works built and acquired by the company have been enlarged and improved from time to time as the necessities of the lumber trade required. For the use of their booms between 1868 and 1876 the company charged tolls upon logs and timber. In the last mentioned year additional powers were obtained, by special Act of Parliament, to enable the company to handle and assort for the owners all logs passing down the Ottawa from Des Joachims, and for this service a special rate is charged to cover expenses. The Chenaux boom in Chats Lake was built by the Dominion Government, but is operated and kept in repair by the company—with the exception of the boat and raft trip—the Government allowing the company a percentage of the tolls collected at this boom. The lumbering community find the company's work of great utility and benefit, the cost of bringing logs and timber down the Ottawa having been reduced about fifty per cent. since 1876, when the company undertook the handling of loose logs on the river. Rafts and cribs of square timber do not pass through the company's booms. Between the different works, on the navigable stretches, the booms of logs are towed by steamers, the use of a boom being to collect and retain logs which come over rapids singly, the practice being to tow the logs in booms to the head of a rapid and allow them to drift over—to be collected below and towed to the next rapid. All the towing from Des Joachims to the head of the Chats Falls is done by the steamers of the Upper Ottawa Towing Company, seven steamers and tugs being employed in this service. From Onio to Ottawa the towing for the north side is done by the steamer Chaudiere, owned by Captain Goulet, and on the south side by the steamer Monitor, the property of the Upper Ottawa Steamboat Company. During the season of 1885, the number of pieces passing the Onio boom was 2,362,361, and it is estimated that 2,750,000 logs, yielding 392,857,000 feet of sawn lumber will be handled by the company during the present season. During the summer season the company employ between three hundred and four hundred men.—*Ottawa Free Press.*

A RAILWAY-TIE NURSERY.

Hon. R. W. Phipps, Forestry Commissioner for Ontario, has been for several months devoting his time to visiting the principal fruit trees, nurseries, and estates, where attention is given to arboriculture for timber and fuel. In a recent letter from southern Kansas to the Toronto *Globe* he writes:

"One railway board here, knowing that the growing of trees when set about in earnest is neither a slow nor difficult task, have established in Kansas the largest artificial plantation of forest trees in North America. These railway gentlemen themselves gave out the contract for planting over a square mile of land with young saplings of the catalpa and ailantus, and their president, observing the success of their experiment, and impressed with the probable excellent financial results, has had planted at his own expense as a speculation as much more. These are situated near the little town of Harlingtown, Kan. These plantations, now bare of leaves, stretch far over the undulating prairie in full view of the town. The different sections have been planted, it appears, respectively two, four, and six years ago. About one-fourth is planted with the ailantus, the rest with the catalpa, and a few—perhaps 1000 trees— of white ash. Those first planted are now about 25 feet in height, the last about 12. Some of the taller are seven inches through the stem. The first seedlings were brought from Illinois by the carload, the rest grown in seed beds here. There are in all about 3,000,000 of trees in full growing vigor on these plantations, this calculation leaving out a few on some small portions of poor land which are not flourishing so well, but will be good trees in time. All were planted four feet apart each way to shade the ground, but eight feet is the ultimate intention, which will allow three-fourths of the trees to be cut out, a thing which can well be done when they are fit for fence posts, say seven to nine inches through, or if required, they can stay even longer without injuring the plantation. When rather larger it is expected the trees will make excellent railway ties, and at their fuller growth of 15 or 20 years they will supply very valuable timber for cabinet work and house building. Those who have only seen the original forest, with its trees growing at haphazard here and there, little ones and big, have but a very vague idea of the large amount of wood the closely planted grove can spare in their process of growth. This process, partly natural, is also by the art of the planter rendered partly mechanical. Extensive masses of young trees planted in this manner are restricted to but one method of advancement—the endeavor to throw out masses of leaves to the light and air of the upper surface. The lower branches, hidden in shade, rapidly die and fall to the ground, and the plantation becomes a multitude of long, straight stems, full of life and vigor, but only spreading into branch and foliage at the summit. If a tree in youth be crooked it straightens itself, if thus surrounded, as it advances in height. One acre so growing will give of wood, which is all the better taken, quite a number of cords yearly till all the superfluous trees are gone. On each acre here there are 2000 more trees planted than will ultimately be allowed to attain full growth. There will be left perhaps 900,000 to come to maturity, and as these, as well as being very useful timber, are fast-growing trees, the profits seem likely to be very large."

NEW BRUNSWICK LUMBER TRADE.

A considerable quantity of lumber is being held at Miramichi ports for higher prices. According to a correspondent at Newcastle, N. B. it is believed that the amount shipped to Europe this season will not exceed seventy million feet, as compared with 117,149,108 and 87 millions in 1882, 3, 4 and 5 respectively. Following are the quantities rafted at the South West boom in these years:—'82, 77,740,241 ft.; '83, 71,194,651 ft.; '84, 37,049,643 ft.; '85, 37,282,825 ft.; '86, 30,806,383 ft. Charters have ranged from 40 to 45 shillings per standard this year. Snowball's deals have been shipped up to date in 34 sailing vessels. No steamers have been employed this season. Most of the deals forwarded have been to ports in France and on the Mediterranean. Nearly all the deals cut by Richards & Hickson at Newcastle are piled up on their wharf, and Burchill, of Nelson, has only shipped two cargoes this summer. Scarcely any move has been made by operators as to next winter's work and those spoken to seemed to be greatly discouraged over the continued depression in the European markets and the prospect of no decrease in the government stumpage tax.

LEISHMAN & PERRY, saw mill operators, Bracebridge, Ont., are succeeded by Leishman & Co.

WANTED.

The publisher of the CANADA LUMBERMAN desires thoroughly reliable and competent correspondents at the following named places :—

Ottawa, Ontario.
Kingston, Ontario.
Quebec City, Quebec.
St. John, New Brunswick.
Halifax, Nova Scotia.
Winnipeg, Manitoba.
Victoria, British Columbia.

The duty of each correspondent will be to give a review of his local market for the month preceding the date of issue, and the ruling quotations for different kinds of lumber, &c. For terms and any other information, address

A. G. MORTIMER,
Peterborough, Ont.

Market Reports.

MONTREAL LUMBER MARKET.

MONTREAL, Oct. 25.—During the month of October, our lumber merchants here have experienced a good trade, the early portion of it showing the greatest activity, and the amount of stock disposed of was very large, prices generally showing good profits. The provincial elections which took place in the middle of the month interfered somewhat with the wholesale business, as these events generally monopolise a goodly portion of the time of country contractors and buyers, but the retail movement at the yards for city trade remained eminently satisfactory, as was also the case with carloads. This last week has shown a resumption of the activity in the wholesale, and dealers are busy bringing down large quantities for the winter trade. Stocks, generally speaking, in Montreal are heavy, and competition is keen in all grades. The mills on the Ottawa have pretty well disposed of this seasons cut, and some will be stopping very soon.

Dimension timber is very brisk here, the Canadian Pacific Railway requiring about a million and a half for their trestlework on the south side of the new St. Lawrence bridge. The greater part of this timber is being cut by firms here, and the material is good, as in all probability this trestlework will be permanent. The mills in the west are all busy getting out stuff for the Canadian Pacific for their Smith's Falls and Montreal line.

Oak has been in good demand, both for export and local consumption ; 3rd and 4th deals have also had good good enquiry, but higher grades have not been as brisk. Among the many new buildings in course of erection in this city, is a large freight shed for the Grand Trunk railway. The new station for this company will be commenced very soon, but owing to the lateness of the season, not much more than the demolition of part of the old one, and otherwise preparing for the reception of material will be done this year. It has been decided to build the station on piles, about 2,500 of which will be required for the work, and these will have to be in readiness for the first thing in the spring.

The export movement still keeps up, and about half a dozen vessels have yet to be dispatched to South America and the United Kingdom with lumber freight. In connection with this, the value of the exports of lumber from Canada to date are nearly a million dollars in excess of the corresponding period of last year. The exports to date embrace 3,070,483 pieces deals, deal ends, boards and battens to Europe, and 17,763,015 feet of lumber to South America.

OTTAWA.

Concerning the lumber trade of the Ottawa district, the *Free Press* of that city has the following:—Much comment has been indulged in on account of the large number of lumbermen who have been sent up to the shanties this fall, and an extraordinary cut of timber has been predicted for next season. This supposition, however, has no basis in fact. A much larger number of men have been sent up from Ottawa this fall, it is true, but the aggregate number of men who have been despatched to the shanties is not much if any in excess of the number sent up last year. The cause of this misconception is attributable to the fact that the mill owners have developed a tendency to cut their own logs instead of having them cut by contract. Consequently the shantymen are engaged and sent up by the mill owners instead of by the contractors as formerly, with the result that the men must be engaged at the mills and thus all start from Ottawa, instead of going from different parts of the country as was the case when they were engaged by the contractors. It will thus be readily seen that although a much larger number go from Ottawa than formerly still the actual number sent up is not necessarily increased. Some of the lumber firms, however, contemplate making heavier cuts this year than for some years past, notably Messrs. Grear & Co. The mills owned by this firm were purchased from the Young estate about a year ago. For ten years they have not had a full supply of logs and the firm have determined to make an alteration in this respect. Messrs. Bronson & Weston are said to have a large number of logs on hand and it is reported that they may probably not cut so heavily this season in consequence. It is calculated that Mr. J. R. Booth will have about 150,000 logs on hand after the mills shut down, to open the next season with. This quantity will probably keep the mills working for one month or six weeks in the early part of next spring. An immense number of logs, however, of last winter's cut are being transferred by the firm's railroad from Lake Nipissing to the Mattawa waters and these will be ready to come down the Ottawa next spring and renew the supply which will have been left over during the winter. About 300 men have been sent up to Mr. Booth's shanties this fall and a large cut of timber will be made in the Lake Nipissing district, where Mr. Booth's limits are situated. On the whole next season will be a tolerably brisk one for the lumber trade, but judging from present appearances not much out of the ordinary line.

QUEBEC.

Four hundred and fifty eight seagoing vessels have entered at the custom house since the opening of navigation and 413 have cleared ; 1836 market steamers and schooners have also arrived. The following export freight transactions are reported : Quebec to Leith, timber, 208, deals 47s. 6d ; Quebec to Greenock, timber, 18s, deals 40s. ; Quebec to Clyde, timber 18s.

Owing to the continued rains the rivers on the South shore have at last risen sufficiently to run the logs, and in consequence Messrs. Brialley and Halls have secured the greater portion of their cut. Mr. Breakey's mills now will be run on full time to the end of the season ; he expects to cut 1,300 to 1,400 logs per day. It is also reported that the Montmorency Mills will again commence sawing night and day until end of season. Their cut will be about 3,000 logs a day. A considerable proportion of Mr. Breakey's logs are run down to Montmorency, and cut into deals etc.

MIRAMICHI.

A travelling corsespondent of the Saint John *Sun*, writing from Newcastle, N. B., furnishes the following interesting particulars of the Miramichi trade from which we gather that a considerable quantity of lumber is being held for higher prices. The quantity shipped to Europe this season will not, it is believed, exceed 70,000,000 ft. That this will be a limited export compared with recent seasons the following figures will show :—

1882 shipments	117,000,000 feet.
1883 "	149,000,000 "
1884 "	108,000,000 "
1885 "	87,000,000 "
1886 (probable) shipments	70,000,000 "

A corresponding decrease is shown in the number of feet rafted at the South-west boom during those years, viz : 77,740,000 ft. in 1882 ; 71,194,000 ft. in 1883 ; 37,049,000 ft. in 1884 ; 37,282,000 ft. in 1885, and 30,806,000 ft. in 1886.

Charters have ranged from $9.60 to $10 80 per standard this year. No steamers have been engaged this season. Snowball's deals have been shipped up to date in four sailing vessels. Most of the deals forwarded have been to ports in France and on the Mediterranean. Nearly all those cut by Richards & Hickson, at Newcastle, are piled up on their wharf, and Burchill, of Nelson, has only shipped two cargoes this summer. Scarcely any move has been made by operators as to next winter's work, and those spoken to seemed to be discouraged over the continued depression in the European market and the prospect of no decrease in the Government stumpage tax.

DETROIT, MICH.

We are having a good demand for local use, while shipping trade is fair. Prices are firm as quoted. Bennett Bros., who sell Dan McCoy's and L. S. Baker's Big Rapids lumber in Ohio and Indiana, report some very large sales, and that trade is good in that country.

ALBANY.

The Albany *Argus*, in speaking of the lumber market at that point, says : "It is very apparent even to the most casual observer, that the trade as a whole, exhibits all the signs of a very healthy improvement. Even those dealers who are among the last to recognize and admit the improved condition of things, are beginning to acknowledge that the trade is shaping itself more in conformity to the desires of the seller, and that present indications point to a much improved market in the near future. The very fair condition in which the trade stands, to-day, is too evident to be denied. Very many large orders have been sold during the past two weeks and buyers are making their appearance every day. They come not only to look around, but to purchase, and, as a rule, the sales made are at the terms of the seller rather than at those of the buyer. In fact, it is the common talk in the district of dealers refusing to budge from quoted figures, even in prospective large orders. The difficulty of getting boats still continues to such an extent that it is likely to become embarrassing."

NEW YORK CITY.

Trade in this city during the past month, has, according to our exchanges been quite satisfactory. On some lines, particularly spruce, the receipts have been liberal. Trade in white pine continues good. Yard business is good. For export the movement, while not as animated as that experienced during the corresponding period in previous years, has been fair. The market for yellow pine has changed but little. Spruce has been moving rather lively.

The wholesale market developed but few features of moment. Trade both for domestic and foreign account continues fair and the general feeling is one of steadiness with prices on some descriptions showing a hardening tendency. Business at the yards has been fully up to that experienced the preceeding few weeks. Some of the yards reported a slight falling in trade with them but the increase at other points more than made up for the decrease. As regards

prices, no change was recorded, the market ruling steady in tone. Freights have undergone little or no change during the week. The weaker feeling at the Gulf noticed in our last continues, but aside from this the tone of the market is one of steadiness. The shipments of lumber from the port of New York during the week aggregated $32,291. This shows a decrease from the two preceeding weeks, the total valuation being $49,305 for week ending October 12, and $68,424 for October 5.—*Lumber Oct. 20th.*

CHICAGO.

Recent advices from this port show that there has been a drop in the prices of green stuff of 25 cents per thousand, cargo lots. The drop is the result of the extra time the stuff must be kept is stock before it is fit for market. Dealers will not speculate in green piece stuff to any extent at this season of the year. It is generally believed that the true policy would be to buy freely now as it is not probable that a better chance will offer. Some appear to think that the drop is a sharp piece of acting on the part of commission men, with the object of shaking the position of mill men. Much lumber by cargo is selling rapidly at firm prices. The offerings of piece stuff have been heavy. Local trade has been heavy and shows a steady increase. Prices continue steady and unchanged, and the prospects are that present figures will hold good for some time.

PHILADELPHIA.

Reports from Philadelphia are unusually encouraging. Trade is brightening up, and the "dullness of the market" which has been the cry for the last year or two, has been turned to a different tune. In the local market the distribution is heavy and prices are firm. The demand from car builders and railroads is still heavy. The shipyards are all busy and are drawing from the stocks. All the mills in the city are busy and have orders ahead. The receipts of white pine are now up to the capacity of the yards. Spruce, hemlock and inch cap pine are in active demand. At a meeting of the Board of Trade of the Lumber Exchange, Philadelphia, a committee on arrangements for the excursion to the lumber regions was appointed. The Pennsylvania Railroad have placed at the service of the Lumber Exchange a special train, free of cost, which will leave Philadelphia October 27th, at 11.30 a. m., for Williamsport, thence to Lock Haven, Tyrone and other places, returning to Philadelphia October 29th. The party will receive every attention at the several places by the representatives of the lumber trade. Valuable results are expected to accrue to the lumber trade of Philadelphia from this trip, as it will tend to place the business upon a sounder basis and slide much of the trouble experienced from imperfect classification and the like. The exchange has been greatly interested in this vital subject; each hour spent upon it will give a valuable return, as everything which tends to simplify the business, or make it more secure, is a reduction in the cost of doing the work, and accrued directly to both parties of the transaction.

BOSTON.

Reports from Boston mills are by no means satisfactory. Scarcity of water power seems to be the principal cause of the dullness of trade. This has had the effect of putting up the prices on all classes, except boards, from 60c. to $1 per 1000. In western pine the market is only fairly active, but in southern stock there has been free arrivals of late. There is an active demand for spruce lumber. There is a fair call for shingles, clapboards, laths, cherry, &c.

The lumber surveyed in Boston for the week ending October 21, was as follows: 405,795 feet pine; 1,263,551 feet spruce; 54,935 feet hemlock; 396,816 feet Southern pine floor boards; 46,415 feet Southern pine timber and plank; 150,366 feet white wood; 141,208 feet black walnut; 128,695 feet hardwood. Total, 2,587,781 feet.

BAY CITY.

Trade in the market is not overly active, there being a boom in nothing but prices, which have risen considerably. The advance in freight rates to Buffalo and Cleveland has had a tendency to check the movement of lumber, and as a consequence the piles at the mills are rapidly increasing. Some sales have been made at good prices the past week, among which are 500,000 feet good stock at $9.50, $19 and $38 by inspection; 1,500,000 feet in three lots ranging from $16 to $24 straight measure; 500,000 feet Norway bill stuff at $8 50 and $9.50; 300,000 feet coarse lumber at $15 straight, and some lots of choice lumber at $10, $20 and $40 under inspection. Hall & Buell, at Marquette, also sold 2,000,000 of stock cut at Manistique to Albany, N. Y. parties at $23. Shingles 18 inch stock have sold at $1.90 for clear butts and $2.85 @ $2.90 for XXX.

LIVERPOOL.

The *Timber Trades Journal*, Oct. 16th says: With a light import during the past week there has not been any great amount of animation displayed at the docks, either with regard to timber laden vessels discharging cargoes or in the quantity forwarded to the country. Still there is a fair consumption going on in a steady manner, which is only what could be expected from the volume of business now being done in the manufacturing districts. This, however, is principally in low-class goods, such as spruce deals and whitewood blocks, for casemaking and similar purposes.

Up to the present time there has not been any actual advance in the market rates for spruce deals, but every day must bring us nearer the time when such may be looked for if the importation continues on the same moderate scale as it is now.

This is more than probable if the information from New Brunswick and Nova Scotia be reliable, which is to the effect that we shall have a considerable shortage of supplies in the latter part of the import season.

There have not been any public sales of whitewoods during the past week, but we notice that Messrs. Farnworth & Jardine, purpose offering by auction on Wednesday next about 900 logs of St. John, N. B., birch timber, now landing on the quay of the Canada Dock, but beyond this we do not hear of any further sales being contemplated.

LONDON.

Timber, Oct. 16th.—We have no change of importance to chronicle since our last. The tone generally has continued very quiet with few signs of any improvement. The present price of good 3rd Swedish deals may be considered about £10 10s. @ £11, and 4th quality about £7 15s. Allowing, say, £2 5s. per standard for present rate of freight, insurance and charges, would leave an f. o. b. price of £8 10s. for 3rds and £5 10s. for 4ths. Few, if any, good stocks are to be brought at these prices, so the market here remains (as it has been through the season), the cheapest buying place. There is, moreover, considerable risk in importing late in the year of goods arriving out of condition, arising from the weather at the shipping ports being very uncertain. The cargoes are frequently unavoidably loaded in wet weather and on arrival here are piled away in the same wet state, and as often as not in rainy weather, thus causing considerable loss and dissappointment to importers. The buyer here who waits to see the goods before purchasing escapes these risks, with the additional advantage that he need only buy exactly what he requires, and as and when he wants it.

The arrivals from Canada have thinned off considerably, and the list for this week is a very light one.in the Surrey Docks, the Kalliope, from Quebec, discharges a cargo of deals for Messrs Price and Pierce; and the West Cumberland, from Montreal, brings 5,000 pine deals and 8,425 boards, for Messrs. Bryant, Powis and Bryant Ltd., the balance of the cargo being divided between Messrs. Churchill and Sim and R. R. Dobell and Co. In the Millwall Docks, the Grafton, from Montreal, brings a cargo of 37,539 deals and 5,967 ends; and the Thorn Holme, from the same port, with a similar cargo, both report to Messrs. Bryant, Powis and Bryant Ltd. The Cotherstone, also from Montreal, brings a mixed cargo of deals, battens and ends, part of which is for Messrs. Bryant, Powis and Bryant Ltd., and the balance for Messrs. Churchill and Sim. The Concordia, from Chatham, with a cargo of deals and ends, is discharging in the Regent's Canal Docks, while the Assyrian Monarch, from New York, brings a cargo of sundries for various consignees; the lattter is in the Millwall Docks.

LONDON, ENG.

London *Timber*, of the 9th Oct., says:—The sales during the past month have been as follows: Quebec pine, waney and square, red pine, oak, elm, ash, hickory; the arrivals have all been on merchants' account, and there are no wholesale transactions to report. Birch: By auction, St. John 14¼ inches average, at an average of 15½d. per foot; Nova Scotian, 14½ inches average, at an average os 13½d. per foot. Quebec pine deals: First quantity regulars, at from £22 10s. to £24 per standard; oddments, at from £18 to £20 per standard; second quality regulars, at from £15 10s. to £19 per standard; oddments, at from £14 to £16 per standard; third quality regulars, at from £8 10s. to £9 10s. per standard; oddments, at from £8 to to £8 5s. per standard. First quality strips, at from £16 to £16 10s. per standard; second quality, £12 to £12 10s. per stantard; third quality, £7 per standard. Spruce deals, St. John at £5 15s. per standard; lower port at from £5 5s. to £5 12s. 6p. N. B. and N. S. pine deals: No sales to report. Scantling and boards, at from £5 to £5 10s. per standard, and with the cargo at stowage rates. Palings, pine 4½ by 1 by 3, at 90s per mille. Quebec staves; merchantile pipe at £62 10s. per standard mille.

The *Timber* of the 9th October says:—The arrivals from Canada occupy a more prominent position this week. In the Surrey Docks we have the Vera, from Miramichi, with pine and spruce deals, and 644 pcs. birch timber for Messrs. Bryant, Powis & Bryant Limited; the Hebe, also from Miramichi, with pine and spruce deals and birch timber, the bulk of the cargo being for Messrs. Bryant, Powis & Bryant Limited, the balance for Messrs. R. R. Dobell & Co. and the Duisberg, from Quebec, with cargo of deals, also for Messrs. R. R. Dobell & Co., now being piled in the Albion yard, the Ashbourne, from Montreal, with cargo of deals, battens and ends for Messrs. Bryant, Powis & Bryant, Limited; the Dunholme, from Quebec, with cargo of pine deals; and the Hovding, from Quebec, also with pine and spruce deals, the three last named discharging in the Millwall Docks, and all reporting to Messrs. Bryant, Powis and Bryant, Limited.

GLASGOW

Timber Trades Journal, Oct 16th.—The past week has been a quiet one here, imports have been light, and there have been no public sales held by wood brokers. At a good many of these recently recorded transactions were comparatively light owing to a want of brisk demand or reluctance on the part of buyers to come up to prices required, and a short interval may help to improve the tone at these sales.

There are some hopeful signs of trade generally being in the way of getting better, and should these be maintained the timber trade will soon begin to feel the improvement; meantime, it is a good feature that, regarding most descriptions of wood goods, the market is not overburdened with stock.

From the statement given in last number it would be observed that there are unusually few lower port pine deals on hand, only some 12,000 pieces, being part of a cargo newly landed. The stock of Quebec 3rd and 4th pine deals, however, though not so large as that of last year at 30 h September, is still considerable.

We observe that of walnut logs in importers hands there are at present about 190, whereas at corresponding date last year the number held was 834 (at Glasgow), which was a larger quantity than usual, on account of a full cargo per sailing vessel having been landed a few weeks previously. This year the imports of walnut logs to Glasgow have been in small parcels per steam liners, except 150 logs, which form part of the stock at present held.

From the official report of building operations in the city for the past twelve months it appears that the aggregate value amounted to £394,540, an increase of £45 525 as compared with the preceeding year.

The new graving dock at Salterscroft, Govan, which has been four years in construction, was formally opened on 13th inst.

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.

General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.
MANAGER—WILLIAM SMITH.

General Offices—Court St., Toronto, Ont.

Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts, and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from misrepresentations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.

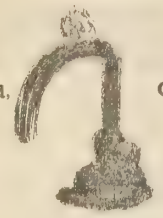
The Improved Model Washer and Bleacher



Pat. Aug 2nd, 1884.

C. W. Dennis. Toronto.

Science triumphs over labor. Thousands testify to its utility and value, weighs only FOUR POUNDS, price $3. Agents wanted in every town in Canada. Delivered to any Express Office in Ontario or Quebec, all charges paid, for $3.50. To any Express Office in Manitoba or N. W. T., B. C., N. S., N. B. for $4. If not found satisfactory money refunded in thirty days, less express charges. The clothes have that pure whiteness that no other method can produce. No rubbing required, no friction to injure the fabric. Send for circulars, address

C. W. DENNIS,
Toronto Bargain House, 213 Yonge Street,
Toronto, Ontario.

QUESTIONS AND ANSWERS.

Q. What kind of boiler do you use?—A. Any kind of a boiler that has a bottom either concave or flat, or an old fashioned washpot. It is the only machine that will work in any kind of a boiler.

Q. How can you have a flow of water at the rate of eight or ten gallons per minute in a boiler holding eight or ten gallons?—A. The same water is used over and over again; and in order to be thus used it must pass down through and through the fabric, and this, with soap and heat, is what does the work.

Q. How can you use a large quantity of water in a boiler already full of clothes?—Fill the boiler three quarters full of water; as soon as the washer commences to work put in the clothes. They absorb it.

Q. Can you wash flannels and coloured clothes?—A. We wash anything that can be washed. Flannels and coloured clothes need but little soap, and from five to ten minutes of the full operation of the washer. Flannels should be rinsed in HOT water. It is the change from BOILING TO COLD water that contracts the fibre, causing them to shrink. Any FULLER will tell you so. Fugitive prints will part with their colours by this or any process, but fast colours will not be injured. It is not best, as every housekeeper knows, to use strong soap or alkalies in washing coloured goods. Many prints and other coloured fabrics have some kind of ACID as a base, and if alkalies are used strong enough to destroy this acid the fabric will part with its colour. This is why English Scarlets, which will not fade in the sun, or by ordinary washing, are ruined by STRONG soaps. These facts are worth remembering by the inexperienced housekeeper.

Q. Can you use the common soft soap of the farmhouse?—A. Yes, if good.

Q. Is it not better to put very dirty clothes to soak over night?—A. No.

Q. Will your washer remove the streaks from dirty wristbands and collars, such as farmers and mechanics wear, after having been worn a whole week, as they usually are? Will not those require extra care in rinsing?—A. The washer will cleanse the dirtiest clothing. Much soiled portions may require a second operation to remove the dirt entirely. Give the clothes a thorough rinsing.

Q. We sometimes find a whitish scum on the top of the washer. What is the cause of this?—A. The water is HARD. When soap is added to hard water, a chemical change takes place. Certain substances in the water having an affinity for the alkali of the soap, unite with it, thus setting FREE other substances; these are PRECIPITATED and fall to the bottom or rise to the surface in the form of a whitish scum, according as their specific gravity is greater or less than that of the water. This is why it is impossible to cleanse fabrics with hard water. It may be softened by the use of borax or sal soda. Pure rain water is the best of ANY method of washing. When the scum referred to above is found on the washer after using, clean with a little coal oil.

Q. How can it be possible for so simple a thing to cleanse fabrics?—A. If you will study the PHILOSOPHY of the Washer carefully and intelligently for a few moments, and consider what is required to remove dirt from clothing, you will ask "How is it possible for it NOT to cleanse fabrics?" A gentleman writing upon this principle, says:—"I must own that when I saw the Washer I was utterly incredulous as to its cleansing powers. My family were still more so. In fact, they had no faith in washers of any kind; but being strongly urged by a friend who had used the machine successfully, I concluded to try one. We made the first trial with a good many misgivings. In fact, I could not see how so simple a thing COULD wash clothing. But when I saw the water pouring out from the discharge pipe at the rate of 8 or 10 gallons per minute, and when I reflected that this amount of water must pass through the clothes twenty or thirty times in the course of an ordinary wash, my doubts began to give way. I saw that there was both philosophy and common sense in the process, and it was impossible that it should NOT prove effective. I am now a firm believer in the Washer, and trust it will find a place, as it deserves, in every household."

The foregoing treatise sets forth as explicitly as possible the merits of the Improved Model Washer and the mode of operating it.

OPINIONS OF THE PRESS.

NEW YORK TRIBUNE: "We are often asked our opinion as to the best Washing Machine in the market, as there are a great many kinds. We do not hesitate to say that the cheapest, most durable, and best washer in the world, is the Model Washer."

THE CANADIAN BAPTIST: "From personal examination of its construction and experience in its use we commend it as a simple, sensible, scientific and successful machine, which succeeds in doing its work admirably. The price, $2.50, places it within the reach of all. It is a time and labor-saving machine, is substantial and enduring, and is cheap. From trial in the household we can testify to it excellence."

CANADA PRESBYTERIAN: "The Model Washer and Bleacher which Mr. C. W. Dennis offers to the public has many valuable advantages. It is a time and labor saving machine, is substantial and enduring, and is cheap. From trial in the household we can testify to its excellence."

DOMINION CHURCHMAN: "Having tested the Model Washer and Bleacher, sold by Mr. Dennis, 213 Yonge Street, Toronto, we can heartily recommend it. Its work is performed thoroughly, and the saving in labor is so great that, combined with its cheapness and simplicity, should bring it into use in every household."

EVANGELICAL CHURCHMAN: "We desire to direct the attention of our readers to the advertisement of Mr. C. W. Dennis, which will be found in our advertising columns. The Model Washer and Bleacher has many and valuable advantages, and from personal trial in the household we commend it as a simple and most successful machine."

TORONTO TRUTH: One of the horrors of everyday life is "washing day," which comes with such persistent regularity week after week. A dreaded necessity, men have turned their attention to mitigating its miseries by the introduction of machinery which will lighten the labor, and make it less slavish. Among the many machines brought before the public with this end in view, the Model Washer and Bleacher, patented by C. W. Dennis, 213 Yonge St., Toronto, is certainly one of the very best. It is constructed strictly on scientific principles, and does all, and more than all, that is claimed for it. Washing is made light and easy, and the labor becomes almost a pleasure. It saves time and labor, is substantial and cheap, and very enduring. No rubbing is required, and the clothes are not therefore, worn out "in less than no time," as is the case in the ordinary method adopted. Its price is placed at the low figure of $2.50, and if not found to be all that is claimed for it the money is refunded.

TORONTO TRIBUNE: "In the olden times and in semi-barbarous countries to the present day, apparel was cleansed by beating it between two flat stones. The modern wash-boards and the numerous washing machines operated on the same principle are only in a degree less destructive to clothing than the former process. The idea that hard rubbing is necessary to get the dirt out of articles is entirely erroneous and the only reason why hard rubbing does take the dirt out is that the water and soap used are forced through the texture with considerable force and carry the dirt along with them. Now if this can be accomplished by a process that saves the great wear and tear of rubbing, a very important point is gained. Clothing will wear ever so much longer, buttons will stay in their places, and the discomforts of "washing day" be greatly ameliorated, to say nothing of the saving of labor. With this end in view the Model Washer was invented and there is no gainsaying the fact that it does its work effectively. To those ladies especially who are in the habit of doing their own washing, the Model Washer is a boon for which they may well be thankful while the price is so low that none need be without one.

What people think of it, a few of the thousands of testimonials and orders which may be seen at my office.

Dear Sir,—The Model Washer and Bleacher I purchased from you three months ago, is all that is claimed for it by the inventor. We are well satisfied with it, and would not part with it for five times its cost, No family should be without it, as it reduces the labor of washing, which is the most laborious and fatiguing of household duties, to a work of comfort and pleasure.

R. S. RENDALL, Simcoe Street.

Victoria, B.C., March 13th, 1886.

Dear Sir,—Having used the Model Washer and Bleacher for three months. I have much pleasure in recommending it as it makes the labor of washing easy and expeditious; it also makes the clothes beautifully white. S. J. H. SHERRING, Spring Ridge.

Victoria, B.C., March 12th, 1886.

Dear Sir,—I have given the Improved Model Washer and Bleacher a fair trial, and do not hesitate in saying it does all and everything that is claimed for it. It gives full satisfaction and does its work well.

C. H. HARRIS.

Victoria, B.C., March 13th, 1886.

Dear Sir,—Having used the Model Washer and Bleacher, I have much pleasure in recommending it. It makes the labor of washing easy and gives the clothes a good color.

MRS. C. S. JOSLYN, Chatham Street.

Victoria, B.C., March 11th, 1886.

Dear Sir,—Having used the Model Washer and Bleacher for three months, and believe it to be the best machine ever invented, and take pleasure in recommending it to the public. It does all you claim for it, and does it well. A. VYR, Spring Ridge.

Victoria, B.C., March 11th, 1886.

Dear Sir,—The Model Washer and Bleacher I purchased from you gives perfect satisfaction. It is the first self operating Washer I ever seen, and does just as represented. MRS. H. SPAFFORD, Cormorant St.

Victoria, B.C., March 13th, 1886.

Dear Sir,—The Model Washer and Bleacher has been in use in my family for the past five months, and it has been found to be all that the inventor claims for it. The washing is now done without the aid of that "Rack of Torture,"—the washboard, and where nine hours were required with the old plan, it only requires four hours now to do a larger washing with the Model. The clothes have a better color, and, from the absence of all friction, last far longer. I can heartily recommend the "Model" to all requiring such an article.

Yours respectfully,
JOHN H. LAND, Grand Secretary R. T. of T.

Rev. John Kay, Pastor of the First Methodist Church, writes as follows:—

Hamilton, December 23rd, 1885.

Dear Sir,—Mrs. Kay says the Improved Model Washer I purchased from you some months ago, has given satisfaction. Truly yours,

JOHN KAY.

Hamilton, December 31st, 1885.

My Dear Sir,—The Model Washer and Bleacher you placed in my house some five months ago, has done all the inventor claims for it,—making the washing both easy and quick. It is an article which we consider indispensable in a house and something we would not like to be without. Yours very truly,

J. B. BROWNE, 46 Herkimer Street.

Hamilton, January 9th, 1886.

I have had the Model Washer, which you sold me, in use about six months and it has given perfect satisfaction. It is a great saving in time and labor.

MRS. MARTIN, 13 John St. North.

Battleford, N.W.T., 3rd January, 1886.

Dear Sir,—Enclosed please find four dollars, for which send me one Improved Model Washer and Bleacher. I saw your advertisement in Toronto *Truth*, and wishing to make a lady a present, thought that nothing could make life easier for a Northwest housekeeper than an easy method of washing. The nearest express office is Swift Current, send *via.* that place,

Yours, etc.,
Sgt.-Major, J. H. LAKE,
N. W. M. Police, Batttleford.

Huntly, March 13th, 1886.

DEAR SIR,—I write you to-day to ask you if you have any agents appointed for the Township of Huntly. I have purchased from John Vance, agent of Fitzroy, five of your Model Washers and Bleachers for myself and friends. I never saw such a success or labor saving machine ; they are giving the best of satisfaction so far. We have not heard or seen any agent for Huntly. Therefore I want you to oblige me by giving me the Agency for the Township of Huntly. Also I want you to send me the wholesale prices by the dozen by return of mail. On receiving your answer I will send for two dozen to start with. I mean to buy for cash on delivery. I can dispose of them almost in almost every house, I think.

Yours respectfully,
THOMAS H. ARMSTRONGG.
Kinburn.

Oromocto, N. B., March 16th, 1886.

Dear Sir,—After using your Improved Washer for nearly a year and found it to give satisfaction, I have decided to canvas for it. I wrote you for agent's terms some time ago. Please mail me 25 of your circulars, which you supply to agents for house distribution, at $2.50 per thousand copies.

And oblige, yours &c.,
L. MCLEAN, P.M.

Trowbridge, March 30th, 1886.

Dear Sir,—The reason I did not write you last month was partly on account of the severe weather and the bad state of the roads, and partly from a scarcity of money with the farmers. This is a new country, and with poor crops and low prices this year, we feel the hard times. So you see it is hard to drive a bargain with the men, but the women are bound to have the machine, so I have about four dozen orders to be delivered the latter part of May and June. So you see if I can't send you an order every month, I feel satisfied I can more than average it the year round. I can send you a number of testimonials from our most influential citizens if they would do you any service.

Yours truly,
FLETCHER COZENS.

Trowbridge, June 5th, 1886.

Sir,—Will you please send one half dozen machines to Mr. J. Borter, Atwood Station. He is selling for me. Send them at once and oblige, Yours truly,
FLETCHER COSENS.

St. Marys, April 1st, 1886.

Dear Sir,—I am in a hurry for four more Washers. The people are beginning to find out they are a good thing, and by proper handling and showing the people how to successfully operate it, it can't fail to become increasingly popular. I will send for larger numbers as soon as money becomes a little more plentiful. A good number have been enquiring for wringers and I shall be able to dispose of a good number as soon as farmers begin to spend a little money for these necessaries, but shall as far as possible sell them both together. You will please send me four more Washers, C.O.D., by express, to Shakespeare. Yours truly,
H. BRINSMEAD.

St. Marys, April 20th, 1886.

Dear Sir,—I am still pushing the sale of the Washer. The more I sell the more there are that wants them. I take pains to show people how to work them satisfactorily, and the people here are more than ever delighted with them. I don't know when I shall be through with Shakespeare, but shall try and supply every family with a Washer. You will please send me six more Washers C.O.D,, to Shakespeare, and things look as though I should sell five or six dozen more. Hoping to be able to do so, I remain, yours truly,
H. BRINSMEAD.

Paris, April 9th, 1886.

Dear Sir.—I wrote you some time ago about your terms for selling your Washer, and got two of them. People objected to them upon the ground that they had not been tried here, so I thought it better to give mine a thorough trial. I have done so and can recommend them. I would like therefore if you will send me the remainder of the dozen and give me the agency of the town of Paris and vicinity.

Yours truly,
MRS. DADSON.

Saint John, N.B., April 13th, 1886.

Dear Sir,—I have seen your Improved Model Washer and Bleacher and consider it the best washer in every respect I have ever seen. Now what I want to know is have you any agent for New Brunswick and if not do you wish one. What are your best terms to agents.

I do not wish the agency for myself, as I am working at bookkeeping for the firm, but wish to procure it for my brother, who, if the terms are satisfactory, I am sure will make a first class man in every respect to handle your patent. Kindly answer by return mail all particulars and oblige, yours truly,

SAM. RICHEY.

St. Mary's, April 29th, 1886.

Sir.—We like the washing machine as well as ever. It is worth its weight in gold. Yours truly,
D. C. BROWN.

Mosside, April 26th, 1886.

Dear Sir,—To-day we have given your washer a trial. My wife and daughter are well pleased with it. There is no doubt it requires a good brisk fire to make it work. My daughter has washed a very large washing and did not commence until after nine o'clock and had it all done and dinner ready at noon, which is a very unusual thing for as large a family as we have. They think it is just the thing for every family to have. If you choose I will endeavor to act as your agent for this township. My wife has just come into my office to tell me that this is two weeks washing for the trial on account of lack of soft water. She thinks for an ordinary washing it can be done in two hours, you may expect to hear soon from me. Yours truly,
JAMES MCCABE.

Mosside, June 11th, 1886.

Dear Sir,—I have been trying to introduce your washer in a few places. Was out to-day and had my wife with me and gave a trial washing at an Hotel which gave perfect satisfaction. I called in several times to see it at work. They all appear to be well pleased with it. I think there will be no trouble in selling six of them in that place, you can send me up next week half a dozen of them for a trial. My next order will be large. It takes some little while to introduce them. The article looks so small people think it is nothing but a humbug. Only I am so well acquainted, they would set the dogs on me. It is very amusing to hear the various opinions given on it. One man said it was an oil lamp ; another would say it was a play toy for the children. So you see the only sure way is to give a trial washing in various parts of the Township which I intend to do next week. Hoping you will send them at your earliest convenience. Direct to Newbury station as before.

Yours truly,
JAMES MCCABE.

Belleville, May 1st, 1886.

Dear Sir.—I am pegging away with the washer. Have sold some which have given excellent satisfaction, and I have many out and still leaving more to-day. I soon expect to send you another order. I have come to Belleville to live, and have taken a little store on the front street and quite near the market. Have filled my window with the washers, and intend painting several signs for it for my front. Yours, with kind regards.

RAYMOND C. ROLPH.

Amubee, May 5th, 1886.

I have see your new Improved Washing machine, and I would like to know whether I could get the agency for the State of Michigan. I have come over for a visit and seen your machine work, I never saw one like it in Michigan, and I would like to know whether you could send them over, or get the agency for four or five counties, but I would like to get the agency for the State of Michigan. Please let me know what you can do with me as I will be going back as soon as I hear from you. JOHN C. BECKER.

Corbetton, May 8th, 1886.

Dear Sir,—My wife, a week ago, bought a Model Washer and Bleacher from you and likes it very well. I should like to know your terms to agents, and if your terms are favourable I will take an agency for Melancthon and Proton, and give it a thorough trial. Please let me know right away, as I should like to start at once. Yours truly,
MARK WILLIAMS.

Belriel, Que., May 14th, 1886.

Dear Sir.—I have just commenced to sell the Washer, people would not trust at first in its good qualities, but now I think I will place the washer more easily, I did not dare to send the money right away, because you might have changed your address. If you trust me send at once half a dozen of the washers, they are anxious to get them. I will send the money for the half dozen as soon as arrived, or, if you don't like to send them write as soon as possible, and I will send the money right away. I would take a dozen of the washers if I could spare the money now, and I know you don't give credit. In three weeks you would get the payment for the dozen. If there is any change in the method of washing please inform me. Yours truly,
SEREINNE CHAGNOW,

Kinmount, May 10th, 1886.

Dear Sir,—Allow me to write you a few lines in reference to your improved Model Washer and Bleacher. My wife can do good washing with it, and says she would not be without it for twice the sum we paid for it. The people here maintain it would not do its work satisfactorily and consequently would not buy, although I have done trial washing to our satisfaction. Some say it takes too hot a fire and too much water. We have lent our washer to the neighbors around here, and they say they like it very much, and intend buying, but money is hard to get around here, and that has all to do with it. I feel quite sure they will sell if times gets little better. If you wish I will act as agent for you in this vicinity. I here inclose three dollars to pay for washers and bleachers. Please forward by return of mail,

Yours very respectfully,
JAMES DAWSON.

Fallbrook, Ont., June 14th, 1886.

Dear Sir,—Enclosed please find forty dollars and fifty cents, for which you will please send to me at once one dozen of your Improved Model Washers and Bleachers, and also a half dozen Clothes Wringers. Please pack them carefully so they will not get damaged in shipping. Send them so I will get them not later than June 21st as I have to deliver them at that date. Send five Washers and two Wringers to Archibald E. Bain, Snow Road Station, on the line of the K. & P. R. R., and send seven Washers and four Wringers to Archibald E. Bain, Flower Station, on the line of the K. & P. R. R. Send me half a dozen Yankee Dish Cloths to Flower Station, on the K. & P. R. R. If you would furnish me with Washers and Wringers and wait until I sold them for your pay, I would devote all my time in selling you Washer and Wringer. I have not got money enough to run the business to good advantage, and if you would let me have them until such time as I would get money out of them to pay for them I could do pretty well. I remain yours with respect,
ARCHIBALD E. BAIN.

Fallbrook, May 7th, 1886.

Dear Sir,—Enclosed please find three dollars, for which please send me one of your Improved Model Washers and Bleachers. You can send it to Fallbrook, Ont., and I will pay the expenses of shipping. If your Washer sells well I intend making a business of it. Please let me know what township I shall have, or if I can have two. Please send immediately.

I remain yours with respect,
ARCHIBALD E. BAIN.

Fallbrook, April 24th, 1886.

Dear Sir,—As I have been hearing something about your Improved Model Washer and Bleacher. I was just thinking that perhaps I might take an agency from you. I would like to take this county for my territory. Please send me your best terms to agents, and oblige,

Yours very respectfully, ARCHIBALD E. BAIN.

THE TANITE COMPANY

STROUDSBURG.

MONROE COUNTY, PENNSYLVANIA, U. S.

MANUFACTURERS OF

Solid EMERY WHEELS

AND SHARPENING MACHINERY.

The products of the Manufacture of the Tanite Company have, for almost 18 years, enjoyed a great reputation, and have been recognized for a long while, in all the countries of the world as a type of excellence in this class of work. In order to increase in Canada their already widely extended use, the Co'y has recently added to the liberality of its terms and conditions, and has chosen the following Houses, so extensively known, to be its Agents:

BEAUDET & CHINIC } QUEBEC.
F. H. ANDREWS & SON }
A. R. WILLIAMS, . . TORONTO.

MONTREAL SAW WORKS . . . . }
MACHINERY SUPPLY ASSOCIATION } MONTREAL
R. H. BUCHANAN & CO. . . . . }

Dominion Saw Works!

JAMES ROBERTSON & CO.

253 to 267 KING ST. EAST, TORONTO, ONT.

VOL. 6. PETERBOROUGH, ONT., DECEMBER, 1886. NO. 21.

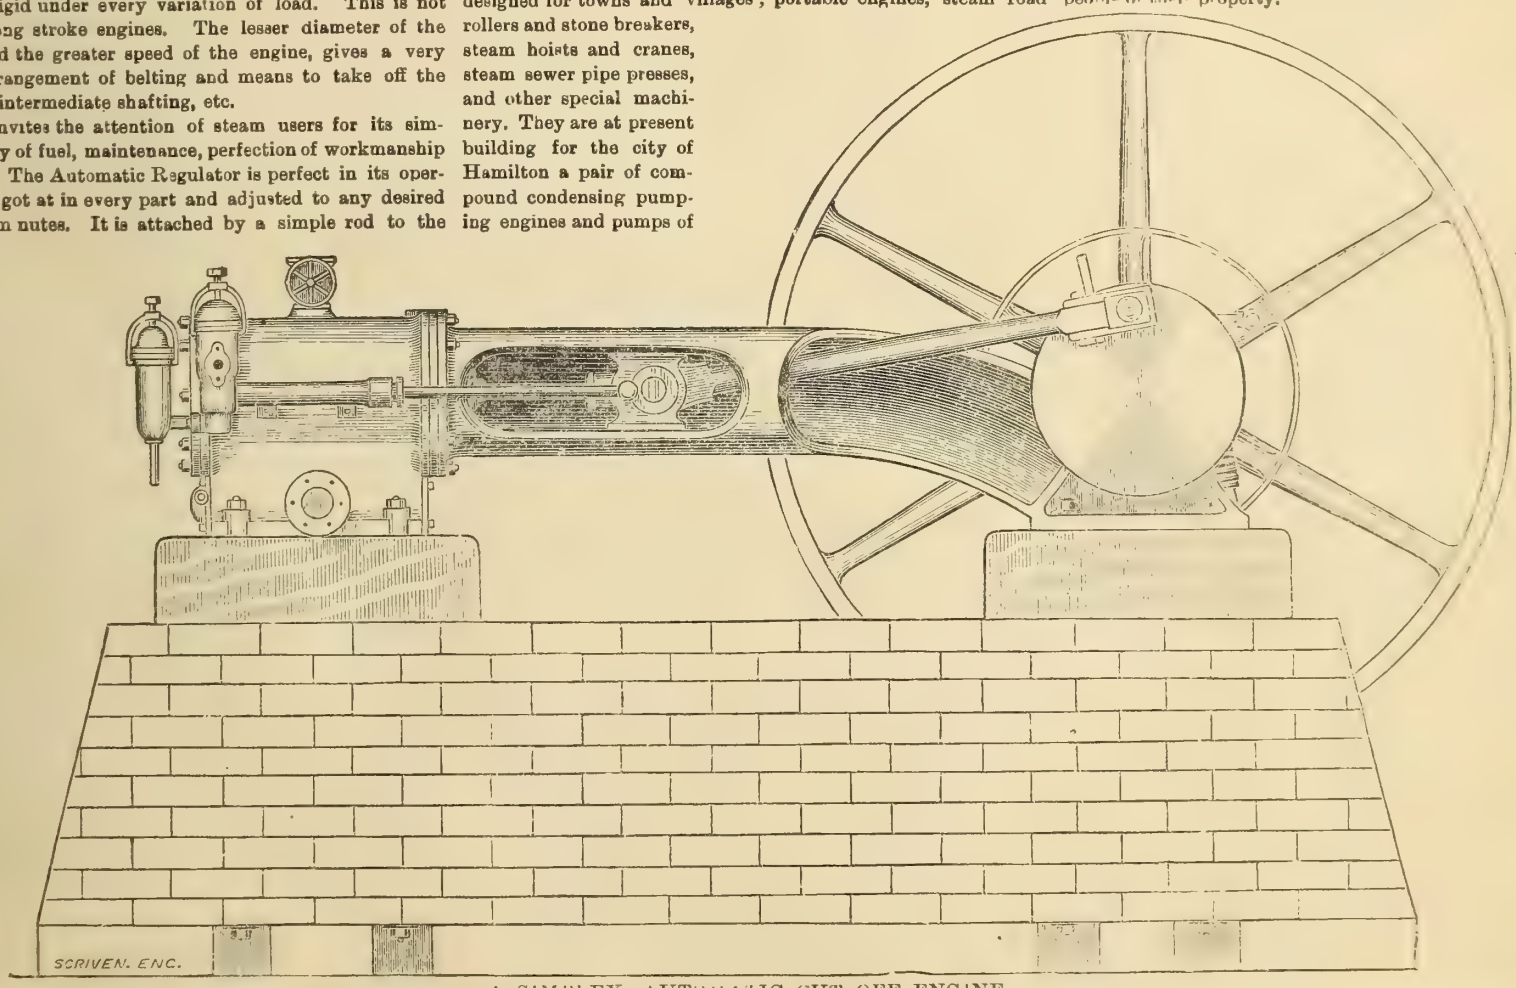
A SIMPLEX AUTOMATIC CUT-OFF ENGINE.

THE accompanying engraving illustrates the leading engine manufactured by the Osborne-Killey, Mfg. Co., of Hamilton, Ont. The advantages claimed for it are extreme simplicity, there being no part of the engine that requires frequent adjustment. The manufacturers claim that the cost is smaller for equal power derived from the fuel burned than that of any other engine running automatically. The engine takes up less space and does not require expensive foundations; the form of engine is such that it is perfectly rigid under every variation of load. This is not the case with long stroke engines. The lesser diameter of the band wheel, and the greater speed of the engine, gives a very much better arrangement of belting and means to take off the power without intermediate shafting, etc.

This engine invites the attention of steam users for its simplicity, economy of fuel, maintenance, perfection of workmanship and materials. The Automatic Regulator is perfect in its operations; can be got at in every part and adjusted to any desired speed in a few minutes. It is attached by a simple rod to the valve spindle, and adjust the cut-off to the power required in a range varying from ⅞ stroke to zero. It acts with great promptness; no perceptible variation taking place in the engine under every variety of load. The cut of valve runs nearly in perfect balance, the governor having complete command of it.

The wide reputation of the manufacturers of this engine, for furnishing only the best of work and materials, render it almost unnecessary to say a word upon this subject, they having sent their engines into almost every corner of the Dominion, but attention might be called to the following important points: best Babbit, main journal linings, and gun metal connecting rod boxes; steel crank and cross-head pins; steel piston and valve rods. To prevent all wear of valves semi-balance valves are used, while the positive cut-off gear enables the engine to run at any speed desired. Another important advantage to be found in this class of engine is the solid forged connecting rods and shafts, and the principle of strict duplication of parts by special machinery, a feature which has just begun to be appreciated by steam users as it should be.

In addition to the manufacture of the engine briefly described above, this firm also manufacture steam fire engines, especially designed for towns and villages; portable engines, steam road rollers and stone breakers, steam hoists and cranes, steam sewer pipe presses, and other special machinery. They are at present building for the city of Hamilton a pair of compound condensing pumping engines and pumps of ten million gallons capacity per day. Full information regarding any of these machines will be furnished by the manufacturers.



A SIMPLEX AUTOMATIC CUT-OFF ENGINE.

STOLEN TREES.

A CONSIDERABLE portion of the last annual report of the Commissioner of the General Land Office is devoted to a description of the methods employed by unscrupulous men to rob the people of this country of their forest possessions. Long practice, often encouraged by official speculation, has reduced the stealing of Government timber to a fine art. It has been going on practically unchecked for years. Wherever trees have grown upon the public domain, among the turpentine producing pines of Florida and Louisiana, in the great white-pine forests of northern Minnesota, in the red-wood forests of the California coast ranges, in the vast fir forests of Oregon and Washington, and in all the Rocky Mountain region from New Mexico to Montana, organized and systematic plunder has for years been practised upon the people of this country. Powerful corporations backed by unlimited capital and immense personal and political influence, wealthy mill owners, rich lumber companies, and unscrupulous individuals have long been banded together to rob the people of their property.

The officers of the General Land Office have certainly not failed during the last year in honest endeavor, at least, to check the numerous frauds which have gradually become a necessary feature in the administration of the public domain. Not less than twelve hundred and nineteen cases of depredation or timber trespass have been reported during the year, involving forest products valued at nearly nine millions and a half of dollars stolen from the people of the United States. Only two hundred thousand dollars, nevertheless, have been recovered by the Government on this account, while the public plunderers have been able to escape with over nine millions worth of timber and other forest products; a sum one-third greater than the gross value of the annual product

of the Government forests of all Germany, or nearly double the the annual net yield of the public forests of France. All depredations have not been reported, and American values for forest products are much lower than German or French values for similar articles, so it is safe to assume that in the last year more timber, bark and turpentine have been stolen from the national forests of the United States than were produced by the public forests of Germany and France, although in these countries forest production under scientific management is now very great.

Such a monstrous condition of affairs should not be allowed any longer. No Government has the right to open such easy paths to fraud and corruption as now cross the public domain in every direction; and no forest, however productive or extensive, can long withstand the inroads which we are making upon our forest supplies.

It is for the best interests of the nation that some portions of the national domain should be permanently covered with a forest growth and retained under Government control; other portions of the forest-clad public domain could, perhaps, be more wisely disposed of than retained. But with exciting information in regard to the public forests it will be highly unwise to make any division of our forest lands into necessary and superfluous before the proper limits of forest reservations are fixed by scientific investigation, and a proper system of forest administration can be developed for their management and control Congress should take prompt action therefore upon the sensible recommendations now urged for the second time by the present Commissioner of the Land Office, that all public forests and all lands valuable chiefly for timber should be immediately withdrawn from sale or disposal, "subject to future legislation for permanent reservation of designated areas and a more economically governed disposal of such timber lands or timber as may not be necessary indefinitely to reserve."

Such legislation would meet with the most vigerous opposition, but unless the Timber Rings can be defeated, the extermination of all the Government forests is merely a question of time, and with the forests agriculture and prosperity will disappear from the western half of North America.—*New York Sun.*

CANADA RAILROADS AND LUMBERMEN.

SOME of the Canadian lumbermen are complaining bitterly, and with no small reason, of the treatment which is accorded them by their railway companies in the matter of lumber freights. A correspondent of the Toronto *Globe* writes at length of the matter, setting forth the grievance of the trade with great clearness and force. The present system is a curious one. Each car has marked upon it its capacity in pounds, the minimum being 24,000 pounds, ranging from that up to 40,000, and the freight is charged on the basis of so much a hundred for the marked limit of the car, unless it should happen to overweigh, when the excess is also added. If the car happens to contain less than the weight it is rated to carry, no corresponding deduction is made, and as many cars, labelled to hold 30,000 pounds, cannot be loaded with some kinds of dry lumber even up to 24,000, the railway companies exact pay for a large amount of freight which they do not carry. If the lumber happens to get rained on in transit, and absorbed a few hundred pounds of water, it is said the companies re-weigh the car, and charge the difference to the shipper. The lumbermen are trying to induce the railway people to make them rates per thousand feet, their experience with the plan of charging by weight not having given them a favourable impression of that method. But the trouble seems to be not so much with the principle, as with the manner of applying it. In the United States, freight rates are made on the basis of weight, but only the actual weight of the stuff carried is charged for, the same as other merchandise. It makes no difference to the railway company here whether the cars are loaded with lumber that has been cut six months or six days; it gets paid for the number of pounds in the car, and it is the concern of the party who pays the charges whether the shipment is heavy or light in proportion to its bulk. It is comparatively easy for a lumberman to ascertain the average weight of stock, and to make his calculations of the cost of transportation with confidence in their substantial correctness. Indeed, so closely can dealers figure the cost of moving lumber, that it has come to be the common practice to quote prices on stock delivered at the buyer's railway station. The basis upon which these delivered prices are made up is an agreed schedule of weights, which though arbitrary, comes so near to the average of dry stock, that neither buyers nor sellers find it objectionable or inconvenient. It would seem the part of wisdom for the Canadian trade to direct its efforts toward introducing the plan, at once rational and fair, of charging shipments at a certain rate for each hundred pounds carried, rather than to attempt the probably impossible undertaking to get the railway people to go back to the scheme of hauling at so much a thousand which is as unfair and unsatisfactory on one side, as the present plan is on the other.

The C. P. R. Telegraph Company are steadily extending their system. They have begun the construction of a branch line from Medicine Hat to Fort Benton, Montana, and it will be in working operation in a few weeks. The cattle business of the railway made this line a necessity. They are also steadily putting up heavy wires throughout the mountains, replacing the poorer ones erected in the "construction" period of the road, and hope to have these wires through to the coast ere long.

General News Notes.

A meeting was held in Cincinnati recently for the purpose of organizing a lumber exchange.

The loss by fire of J. A. Duval's saw mill at Grimsby, Ont., amounts to $2,000; no insurance.

Pine deal mills are now coming to a close, several of them having finished sawing for the season.

It is said that a Canadian lumber syndicate has acquired title to 500,000 000 acres of land in Minnesota.

It is stated that upwards of 100,000,000 feet of logs have already been skidded on the Menominee River, Mich., but the report is not generally credited.

The men are at work closing up Eddy's mills for the winter. The saws are being taken out and everything is being prepared for the closing in of the sides.

The large lumber firm of W. J. Trounce & Co., Port Perry, has assigned. Their bankers have a claim of $100,000; other liabilities it is said, will not exceed $5,000.

Mr. J. R. Booth has purchased the entire timber limits, six limits in all, of Messrs. Barrett & Mackey, in the Nipissing district. The price paid was $270,000.

The firm of Ross & Little, sash, door and blind manufacturers, of Midland, Ont., has been dissolved. Hereafter the business will be carried on by Messrs. Ross & Davenport.

Mr. Nagle, of Ottawa, has sold a timber limit of 36 miles on the Georgian Bay, to Mr. Burtin, of Barrie, for $35,000. Mr. Burtin bought another limit adjourning the former one, of 36 miles for $25,000.

Mr. J. R. Booth has laid up three large rafts to winter over at Mulloch's boom, Arnprior, having decided not to put them on the Quebec market this year. There is said to be more timber being sent to Quebec this year than there has been for several seasons.

A correspondent of the Minden *Echo*, writting from Mr. John Dwyer's shanty, Anson, gives the following:—"On Saturday of last week Mr. George Long, of Peterborough, skidded 431 logs in eight hours. This is considered the biggest days skidding ever done in this country, and if it can be beat the boys would like to hear from the champion."

The square timber market in Quebec is getting brisk. The Messrs. Hurdman, of Ottawa, and McLachlan Bros., of Arnprior, will shortly open shanties to supply the demand. Orders have been left with Mr. B. Renaud to procure gangs at once for both these firms so that operations may be begun without loss of time. Mr. Renaud shipped a gang recently to Sturgeon Falls, for Mr. J. R. Booth's new limit.

The Section north of Harvey, Ont., is alive with men busy at felling the lofty pines. The Gilmour firm has over 50 men employed at the depot, and more are arriving continually. This season will be unusually lively, as Mr. Biglow and Mr. Davis will have men employed in the vicinity of the Gilmour camps. Life in the lumber camp as pictured in "Picturesque Canada" presents an interesting scene, but the original only can give a true picture.

The *Jane Woodruff* loaded with 150,000 feet of lumber for Midland ran on the Watchers last week during the gale. She was trying to make a short cut and finding herself among the rocks cast both anchors when the cables parted and she drifted on in spite of all effort. The *Shawanaga* went to her rescue, but could not get near enough to throw a line, on account of the heavy sea, and was obliged to return without rendering any assistance. A part of the cargo will have to be transferred before she can float.

Nearly all the logs on the Chaudiere have been secured, Mr. John Breakey's railway from his mills to the Chaudiere Basin is now being worked day and night, carrying logs from the mill dam to the mouth of the Chaudiere, where they are rafted and towed to the Montmorency Mills, part of these logs being a portion of the logs cut by Messrs. Hall Bros. during last winter, balance being Breakey's, which, owing to the large number of logs that have come down at once, he is having sawn into deals at the Montmorency Mills, which are being run night and day.

Ottawa millowners were not so busy last fall, nor are they this, as they were in previous years, this they attribute to the increase of railway facilities. In old days people had to obtain the whole of their winter stock before the end of the fall, but now with the increased powers of transit they can receive lumber by rail at any time. This means increased employment at the lumber yards during the winter. The trade is steady at unchanged prices. But little lumber is obtained in Ottawa, the output having been principally disposed of for the American market. The local demand is moderate.

The lumber season now opening in Manitoba promises to be a most active one, says the *Free Press*, and lumbermen are consequently in good spirits. Gangs of men are already being sent to Lake Winnipeg and the Lake of the Woods districts, and a week or two will see operations in full swing. A good many lumbermen did not get all their last winter's cut down to the mills last summer, the drives sticking, owing to the lowness of the water. There are several millions of feet at present on the rivers waiting for the spring freshets to bring them to the mills. A heavy demand for good lumber for railway bridges existed last season. From Winnipeg and all points of the Northwest there has been a demand for lumber, which indicates that building operations have been heavily carried on during the past summer. The mills have been rushed to their greatest capacity. Prices are stiffening and are now from $14 to $15 per thousand feet f.o.b. at Keewatin, and from $17.50 to $18 50 at Winnipeg. They are expected to keep up if the market is not glutted by too heavy an output.

Up to the present time there have been cut and shipped at the Rathbun Co's mill in Campbellford, about 75,000 railway ties, and nearly 25,000 remain to be cut before the work will be completed. Besides this large cut there have been turned out 500,000 feet of lumber, and 12,000 bundles of lath, together with an enormous quantity of shingles, barrel heads, pickets, and several thousand feet of two foot wood. The shipment of ties recently amounted to two train loads daily. A pier is being built at the rear of the Company's premises to prevent the place from being flooded by the river. This will be extended from the mills along the river edge to the southern limit of their property, and the grounds will be filled in and made level. The work is being done now, and will be completed sometime next summer. This mill, we are informed, is one of the best paying of its kind in the country, a tribute to the ability of Mr. Joseph Clairmont, the manager. Work will be continued till about the first of February next, but the staff of hands during all that time will not be as large as it is at present.

Messrs. Grier & Co., are builing a large new mill which is situated between their old mill and McKay & Co's. flour mill. Operations commenced a few days ago, and are at work on the foundation, which is of stone five feet in thickness. The mill is to be fifty feet wide by one hundred and fifty long. There will be placed in the mill one gang-saw of the lat st style, two slabbing gang-saws and one stop gang saw, all of American make. A large dam will be built in front of the mill to keep the water back while operations are going on. The foundation will be finished in about three weeks, when three large stone piers, measuring twenty feet in diameter, will be built in the bottom of the mill, to hold the gang saws. The new machinery for cutting up the refuse will cost about $12,500. The waterwheels will cost something over $3 000, while the edger and other small-mens will cost about $12,000; the whole estimate cost is about $50,000. The top part of the mill will be of wood, and resemble very much in shape Eddy's large mill. It will be painted and decorated, and it is said it will be one of the finest mills in Canada. The building will extend 12 feet nearer the bridge than the old one, and 37 feet farther back. The mill will employ 30 men inside, and be finished about the 1st of May next. Owing to the prospective increased mill being built, Messrs. Grier & Co. will have to double the capacity of their sorting and piling grounds, thus giving employment to a very large number of hands.—*Ottawa Evening Journal.*

A wedding took place last night in the long drawing room of the Queen's hotel, the contracting parties being Mr. William C. B. Rathbun, youngest son of the late H. B. Rathbun, of Deseronto, and Miss Jean Blakie, eldest daughter of J.L. Blakie, late of Hollydean, Rosedale. Owing to the recent death of the groom's father the wedding was comparatively quiet. The bride was attired in a dress of lesse, lace front, with long court train and waist of ivory moire, a long spray of myrtle and white lilac looping up one side; bouquet of loose white roses, held together with white ribbons; ornaments, diamonds. The bridesmaids, Miss Alexander and Miss M. Blakie, wore dresses of coffee-colored Indian muslin and lace with crimson velvet sashes, bouquets of loose Marechal Neil roses held with crimson ribbon, diamond ornaments given by the groom. The bride's train was carried by Miss Florence Blakie and Miss Edna Hindhaugh. The floral decorations were most abundant, the string band being completely hidden by a bank of foliage and flowering plants. The presents were exceedingly handsome, the groome being a set of jewellery composed of moonstones and diamonds, with a diamond crescent brooch, having ten large diamonds. The groom was attended by Dr. A.J. Johnson and Mr. E.W. Rathbun. After the ceremony the band played the Wedding March and the company repaired to the dining room to enjoy a sumptuous dejeuner. The happy couple left by the 11.15 train for California where they will spend some months on their honeymoon.—*Toronto Mail, Nov. 4th.*

The Montreal Press.

There has been a remarkable newspaper development in Montreal during the last few years. It is not long since there were only a couple of French Canadian daily papers in that city, and now there are five live daily journals in that language. It is probable that a great deal of this development is due to the success of *the Montreal Star*, on which nearly all the French papers are modelled. *The Star* rose very rapidly and very remarkably through its enterprise and independence to its present position as the best and most widely circulated daily newspaper in Canada, and as it has always been widely read among the French Canadian business and professional classes, its success stimulated the development of French papers. It is rather a curious fact, however, and a remarable compliment to the *Star* that neither its independence of opinion nor the growing competition to which it is subjected checks its progress as a favorite paper with French-Canadians.

Useful Information.

A rubber cushion under the legs of a work bench will deaden the sound of hammering so completely that it will not disturb the inmates of adjoining rooms.

In putting up your screen doors and windows be very particular to have a little hole in one corner so that the flies can go out doors when they get tired of being inside.

To remove iron taste from new kettles, boil a handful of hay in them and repeat the process if necessary. Hay water is a great sweetner of tin, wooden and ironware. In Irish dairies everything used for milk is scalded with hay water.

A government inspector of timber in France recommends for timber used in ship building one year's immersion in river waters two years in fresh, or three in brackish water, constantly being changed, to be followed by two years of air seasoning.

A Filler for Oak, Maple and Cherry Wood.—Whiting 6 ounces, japan ½ pint, boiled linseed oil ¾ pint, turpentine ½ pint, corn starch 1 ounce; mix well together and apply by continuous rubbing in. On cheery wood add a little Venetian red to the above mixture. A cheaper and for most uses a better filler than this can be bought already prepared.

Wood may acquire an oak, walnut or cherry color by staining it with ordinary tincture of iodine diluted with spirit until the exact shade is obtained. White shellac must be added to the iodined solution if the stain is to be made permanent, or the wood after the stain is applied may be French polished. The iodine may be laid on with a rag or a brush.

A german chemist has discovered that the strength of glue is very greatly increased by the addition of one-fourth as much glycerine as glue. Glycerine has many other uses, among which one of the least known is its property of removing pencil marks from paper in a very perfect manner. It may also be combined with starch and plaster of Paris, to form one of the most durable cements for various kinds of apparatus.

When opening correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

What is claimed to be a valuable rust preventive is a recent German invention. It consists of ordinary oil paint mixed with 10 per cent. of burned magnesia, baryta or strontia, as well as mineral oil. This neutralizes the free acid of the paint, and the alkaline reaction protects the iron from rust. As a preventive of iron from rusting in the ground, the metal is painted over with a mixture of 100 parts of resin and 25 parts of magnesia, besides mineral oil. A temporary paint for the movable portions of machinery contains some 20 or 30 per cent. of magnesia or burnt dolomite, with some vaseline added to prevent drying.

The following is a good recipe for waxing floors, and the method of application. Stir twenty-five parts of shredded yellow wax into a hot solution of twelve parts of pearl ash in soft water. Keep the mixture well stirred until the effervescence ceases, then remove it from the fire and stir in twelve parts of finely-ground yellow ocher. It may now be poured into cans to cool. When wanted for use one part of it is dissolved in five parts of boiling water. Apply warm with a paint brush. It dries in a few hours, when the floor is polished with a floor brush and afterward wiped with a woolen cloth. It is said this wax coating will tal, for six months with ordinary use.

The *National Druggist* gives this form of an absolutely clear solution of shellac:—Prepare first an alcoholic solution of shellac in the usual way; a little benzole is then added, and the mixture well shaken. In the course of twenty-four or forty-eight hours the fluid will have separated into two distinct layers, an upper alcoholic stratum perfectly clear, and of dark red color, and under it a turbid mixture containing impurities. The clear solution may be decanted or drawn off.

The following is a good receipe for waxing floors, and the method of application. Stir twenty-five parts of shredded yellow wax into a hot solution of twelve parts of pearl-ash in soft water. Keep the mixture well stirred until the effervescence ceases, then remove it from the fire and stir in twelve parts of finely ground yellow ocher. It may now be poured into cans to cool. When wanted for use one part of it is dissolved in five parts of boiling water. Apply warm with a paint brush. It dries in a few hours, when the floor is polished with a floor brush and afterward wiped with a woolen cloth. It is said this wax coating will last for six months with ordinary use.

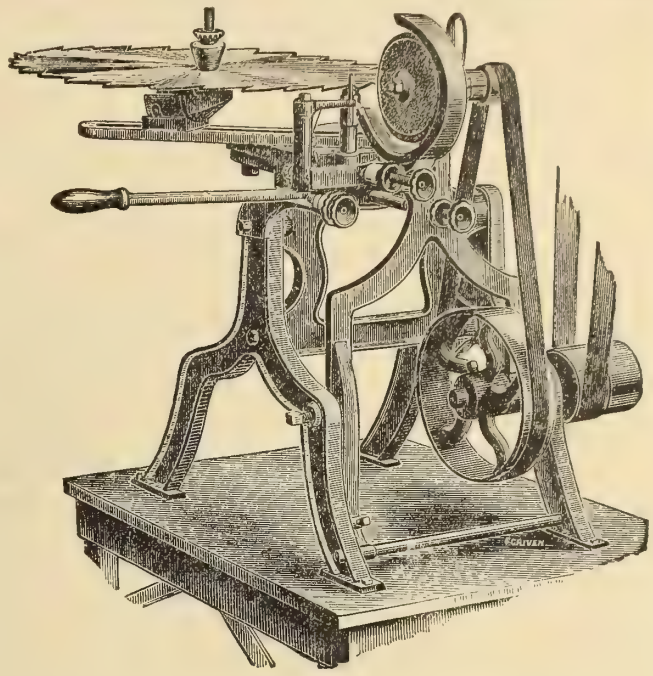
Sand paper is at present made with powdered glass instead of sand. Glass is readily pulverized by heating it red hot and throwing it into water, and finishing in an iron mortar. By the use of sives of different sizes of mesh the powder can be separated into various grades, from the finest dust to very coarse, and these should be kept separate. A strong paper is tacked down and covered with a strong size of glue, and the surface covered with powdered glass of the desired fineness; when the glue is dry the surplus glass is shaken or brushed off. Muslin is better than paper, and lasts much longer in use.

SOMETHING NEW IN SAW FILERS.

Emery wheels are playing an important part in many lines of manufacture, and the ingenuity of inventors has been directed towards providing suitable devices to run them, and enable them to do their work in the most effective manner.

The Hart Emery Wheel Co., of Hamilton, have by no means been neglecting the interests of their customers in this respect, for they have at least contributed their share of improved devices for running emery wheels.

Not the least ingenious of their emery wheel machines is the Rogers' Saw Filer, herewith illustrated, the invention of Mr. S. C. Rogers, one of the Company. This little tool has been patented in Canada, the United States and England, where



several of them are used. They found their way as far as India, and there is no doubt that every woodworking establishment will have one or more of them as soon as they become known and appreciated. The Hart Emery Wheel Co. have placed them in nearly seventy establishments in Canada, every one of which is a reference as to its usefulness.

The machine is almost automatic. The operator has only to move the lever back and forth. The saw revolves and the wheel moves out and in, in perfect time. Any one part of a tooth can be filed lightly or heavily without touching any other part. For instance, the operator can go all round the saw, filing on the throat only, or along the breast or back, and what is done on one tooth can be repeated on all the others, for perfect roundness is the result of using this machine.

Firms who are using the Rogers Saw Filer assert that they find their saws do better work; they keep sharp longer and do not wear away so fast.

See the Hart Emery Wheel Co.'s advertisement on outside of back cover.

Our Readers who write to advertisers in this Journal, will oblige both the advertiser and publisher by mentioning the "Canada Lumberman."

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. Patent Office, up to Nov. 25th, is specially reported by Franklin H. Hough, Solicitor of American and Foreign Patents, 925 F. street N. W., Washington, D. C., who will furnish copies of patents for 25 cents each.

350,352—Plane, Rounder—J. L. DeHuff, Reading, Mass.
350,190—Planing and Matching Machine.—W. H. Doane, Cincinnati, Ohio.
350,193—Saw, Hand—W. H. Fritts, Plano, Illinois.
350 409—Saw, T. Van Hand—Ostrand, Kinsley, Kansas.
350 179—Stump Extractor.—W. H. Wright, Laconia, N.H.
350,657—Auger.—S. Bard, Bradenville, Pa.
350,613—Plane, Bench—F. M. Bailey, Pittsburg, Pa.
350,555—Planer, table cushioning device—F. Phillips, Newark, N. J.
350 892—Planing Machine.—G. S. Myrick, Philadelphia, Pa.
350 482—Saw mill attachment.—W. H. Roberts, Cheboygan, Mich.
350,742—Saw mill carriage.—E. Hyde, East Saginaw, Mich.
350 853—Saw swagging device.—P. R Ward, Quincy, Ill.
350 894—Sawing machine.—G. Puhl and A. Mertes, Allegheny, Pa.
350 872—Tenoning machine.—A. L. Cushman, Concord, N. H.
350,520—Wood-working machinery knife.—J. B. Wood, Chicago, Ill.
351 303—Planing and matching.—S. A. Woods, Boston, Mass.
351 165—Saw mill carriages. Feed machanism for—C. E. Clark, Belmont, N. Y.
351 202—Saw mill carriages. Feed mechanism for—G. M. Pelton, Belmont, N. Y.
351,144—Saw mills. Log hook for—P. B. Williams, Butler, Indiana.
351 106—Saw set.—H. A Hanser, Christiana, N rway.
351,286—Saws. Device for jointing and setting the teeth of—R. M Sandford, Hobart, N.Y.
351,277—Stump extractor.—E S. Moore, Coleman, Mich.
352 307—Planing machine.—W. H. Doane, Cincinnati, Ohio.
352,352—Saw-filing implement.—P. A. Potter, Wellsborough, Pa.
352 269—Saw, drag.—B. F Shinn, New Iberia, La.
353,207—Saw-setting device.—J. B. Sylvester, Blue Hill Falls, Me.
352 370—Stump-extractor.—F R. Smith, Tomah, Wis.
352 216—Timber, preserving.—A Aiken, Darroch, Scotland.
352,901—Lathe for turning spinas—G. Wood, Philadelphia, Pa.
352 867—Saw—C. W. Goerts, Newark, N. J.
352 624—Saw.—T. O. Laughlar, Shannah River, Canada
352 550—Saw gummer.—T. S. Maxwell, Albaretta, Ga.
352 838—Saw-mill set-works.—W. F. Parish, Minneapolis, Minn.
352,802—Saw sharpening machine.—A. Blackmer, Minneapolis, Minn.
352,670—Saw-swage.—C. Ward, Hering, Mich.
352,769—Stump-puller.—W. M. McKay, Wilmot, Mich.
352,004—Saw.—F. H Richards, Springfield, Mass.
352,050—Saw-jointing device.—J. W. Edmonson, Mendon, Ohio.
351 974—Saw-mill set works.—F. J. Grease, Van Wert, Ohio.
351 815—Wood-bending and drying machine.—S. Swartzo, Buffalo, N.Y.
352,003—Wooden-plates. Apparatus for cutting circular.—I. M. Rhodes, Hancock, Mich.

THE ACTION OF FORESTS ON AGRICULTURE.

To the Editor of the Canada Lumberman:

Sir,—I have been asked to state concisely, with a view to its publication through the press, thus reaching a larger circle of readers than will peruse blue books or reports, the reason for maintaining forests among agricultural lands, and the best method of doing so, without asking too much expense from any individual proprietor. I have stated a few here, and should be glad if, in the interest of the forestry movement (which is, in view of the great harm over-clearing is doing our agriculture, the cheif need of Ontario) you will give it a place in your columns.

The reasons for maintaining forests are:—That they hold the rain in their beds, which are formed of a deep mass of leaves, and decayed forest refuse (this is so long as the forest is kept free from grass. If cattle be let in to tramp it hard, and grass over-spread it, it will not retain nearly so much, and will be to that extent inferior in value as a reservoir of moisture to the farm lands around) This water so held, filters off slowly through the surrounding land, and keeps creeks, rivers, and the numerous underground channels of the earth supplied with water, which furnishes moisture thus to the whole country. If there be no woods, rain flows off at once to the river, washing away much good earth in its progress, and being of very slight beneficial effect compared to what it is in the former case.

That they in the season of growth, when showers of rain are needed, being then possessed of vast quantities of leaves, which throw out much moisture daily, and this moisture being the lightest of all vapors, send large quantities of it upward to the higher atmosphere. Being cooler than the air current above, when it meets one sufficiently damp, the juncture of the warm and cooler bodies immediately must produce precipitation, and rain must fall at some point, either nearer or further, depending on the speed of the wind then existing. That woods, or even single lines of evergreens, exert a powerful influence by way of shelter, thus, that when a shower of rain has moistened the ground, that land will aid vegetation rapidly so long as the moisture is evaporating from the surface, for all that time the land will be neither too wet nor too dry, and the moisture will not be stagnant, which is injurous, but in motion, when it is beneficial. When there is no shelter, the drying winds pass over too rapidly, and the benefit of the shower does not remain in the land for half the time it beneficially might.

That the shelter of trees in lines or blocks is very valuable to winter crops, in preventing the uneven drifting of snow, and otherwise; and this is very important with reference to the growth of clover, which is the principle means of keeping in good tilth many of our Ontario soils.

These are but a few of the reasons, the cheapest methods of obtaining these advantages are first to preserve a piece of the original forest on each farm, which I have known done effectually simple by fencing the piece desired to preserve, and keeping cattle out; and next by planting long lines of evergreens as windbreakes. If the latter be tried, the way to success is to plant about the first of June, and keep the roots quite damp and covered from sun and wind till planted.

Yours truly,

M. W. PHIPPS.

Toronto, Nov. 9th, 1886

When opening correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

SOMETHING ABOUT SHRINKAGE.

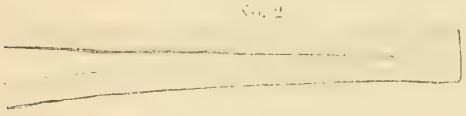
BY E. H. DAVIES,

There s but very little material that keeps the same size under all circumstances. Metals shrink and expand—some very much more than others—according to change of temperature. I don't wish to treat of the shrinkage of metals in this article, but wholly upon the shrinkage of woods. Like metals different woods vary much in shrinkage. But all woods of the same variety will shrink in size, in proportion to the amount of water or sap contained in the wood. One variety of wood may contain four times the quantity of sap, and still not shrink near as much as others, Lumber sawed from trees growing on a side, hill, or near the water, or on the south side of a grove, will shrink very irregularly. Some parts will shrink very much more than others, more particularly endways. The same is true with a tree that grows very much out of perpendicular. Suppose a tall tree was growing at an angle of 45 deg. the tree itself being perfectly straight, as soon as the tree was cut down, it would partially assume the shape of a rainbow.

Nearly all the lumber shrinks, more or less, endways. Some lumber will shrink on one side and expand on the other the moment it is sawed. This is very noticeable in sawing lumber for logs. For instance, the first board sawed from a log may be longer than the log, or *vice virsa*, according to which side the sawing was commenced. It is also very noticeable in ripping up lumber; sometimes when the saw gets well into the board, it begins to pinch, and has to be wedged, but after the saw gets

No. 1

No. 2



nearly through, the cut begins to open, as illustrated in cut No. 1.

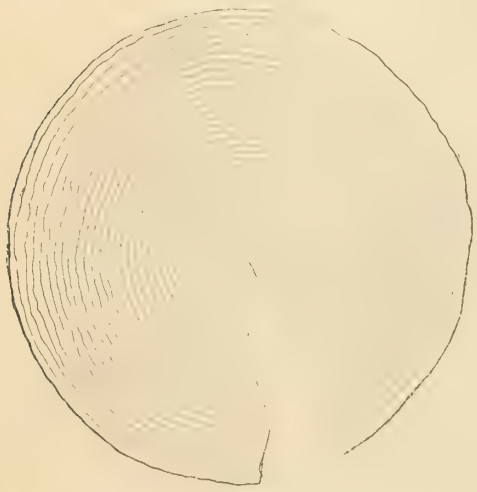
Or it may open instead of pinch, as shown in cut No. 2.

This is all done by shrinkage and expansion. In No. 1 the inside shrinks while the outside expands; and in No. 2 exactly the reverse. We will suppose that No. 1 and No. 2 each represents a board 12 or 14 ft. long, 1 inch thick and 12 inches wide. Now if a piece one inch wide is sawn out of the centre of No. 1 the piece would be shorter than either side; and if the same had been done to No. 2 the piece would be longer. Straight edges can never be made of such lumber.

It is doubtful if there is any lumber known that shrinks as much endways as redwood. The wood shrinks on an average ¼ of an inch in 12 feet; but there are cases when it is four time that amount. When window casings are nailed to green rustic, oftentimes the latter in shrinking will pull the frames open and let the sash out.

I wish to show now why lumber checks in seasoning. Nine-tenths of all the cracking or checking in seasoning lumber is caused entirely by light and not by heat. Lumber can be seasoned very rapidly by intense heat, without even a check, provided not one ray of light is allowed to reach the lumber

No. 3



during the process of seasoning. I also wish to show why a log will split while seasoning. For example, let me take a section of a green log of madrone, blue gum, or any other of that class of woods (which comprise at least one-half of the woods known); we will take a log of 18 inches in diameter and saw off a section 6 inches long, and let it season (in the dark if you please).

Here we have it at cut No. 3, thoroughly seasoned and find it about the same diameter and circumference that it was before seasoning; we find that the depreciation in size lies in the V-shaped cleft; and this cleft is caused by the wood shrinking very much in circumference, and in diameter hardly perceptible, consequently the fibre must be torn asunder. To illustrate this more fully we will take another section of the same log and cut three pieces out as shown in No. 4, two pieces being 4 inches square, and 1 piece round and 4 inches in diameter.

No. 4

We find them as shown after seasoning to be in the shape as shown in cut No. 5.

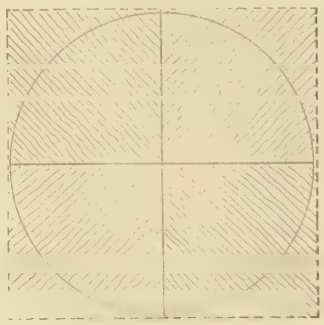
We find that A has shrunk in width at the top ½ inch, and at the bottom 5-16 inch, while from top to bottom it has only

No. 5

shrunk 1 32 inch. B we find has shrunk from right to left § inch, while from top to bottom it has only shrunk 1-16 inch, which leaves it in the shape of a diamond. C we find to be egg-shaped; the longest way has shrunk 1-32 inch, while the shortest has shrunk ¼ inch. "Well," says one, "what are we to do about this shrinkage, we can't help it, can we?" That is very true you can't stop the wood from shrinking, but you can help using that shrinkage in the wrong direction.

Suppose you have a solid cylinder to make, say, 12 inch diameter and 3 feet long, to be and keep perfectly round. This cannot be made of one piece (even if you had it), neither can it be made of several pieces, unless glued up in the right manner, and with the right kind of lumber, or with lumber having the grain the right way, which should be an angle of 45 deg. It makes no difference how many pieces are used, provided there is no less than four.

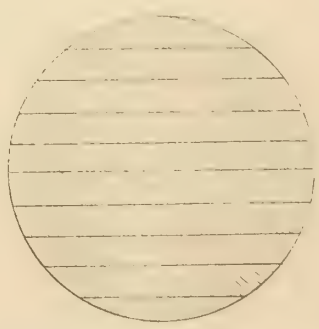
No. 6



Cut 6 is a section glued up of 6 inch square timber.

Cut 7 is formed of 1½ inch plank, glued together with the grain running like either No. 6 or 7; once made it will always keep round; whereas, if the timber is put together with the grain

No. 7



running as it did in the log, it will not make so good a job as if made of only one piece.

The reason that articles made of pieces glued together will not warp and twist as much as if made of one piece, is owing to the mixing of the grains, which generally gets mixed more or less, but without any regard to it on the part of the workman. Woodworkers, bear this in mind—wood shrinks in circumference of the grain, but comparatively nothing in diameter.

THE COST OF THE BIG RAFT.

All efforts to launch the big raft at the Joggins has hitherto failed. The Telegraph says: "Since the raft has been upon the waves it has altered in shape considerably. It was originally 55 feet broad and 36 feet high. It is now 62 feet broad and 31 feet in height. At high tide the water at the lower end of the raft is 19 feet in depth, and causes the structure to lift a trifle. A number of hydraulic jacks have arrived from New York, and the work of pushing the raft to deep water will be proceeded with at once. Mr. Robertson has obtained some eye bolts which will be placed in the rocks on the ledges on either side of the passage way through which the raft has to go. Hawsers will be attached to these, and the raft will be kept there in position until the tugs arrive to take her in tow. It may interest the public to know how much this great raft cost and how much would have been saved if it had been launched when the first attempt was made. A reporter of the *Sun* interviewed several of the principal business men in the vicinity of the Joggins, most extensively engaged in the piling business. The result of the interview was about as follows: There are in the raft about 2 225,000 feet of lumber, which could not be carried from the Finger Board to New York in less than fifty schooners. The average price of piling cut conveyed to the shore ready for shipment is 1¼ cents per foot. There are required to place it on board the vessel 2½, which includes the freight and the cost of discharging. This brings the cost of the piling delivered in New York, up to 3¾ cents per foot. and in addition the port charges and commission will bring the costs up to 4⅛ cents these charges averaging about § of a cent per foot. An ordinary schooner will carry about 20,000 feet, and her cargo landed in New York will cost the shipper $825. As there are about fifty such cargoes in the raft, the cost of the lumber, if it had been carried in vessels would have been about $40,000. The raft, as it stood in August last, when it was first in readiness for launching, was in the vicinity of $13 000. it is perhaps not out of the way to mention that the builder B. B. Barnhill, lost something like $5,000. Already about $10 000 have been expended in attempts to launch it, which brings the cost up to $23,000. From this it will be seen that the owners can afford to expend some thousands of dollars yet to launch the raft and land it in New York with a lesser outlay than would have been required had the lumber been shipped in vessels.

FREIGHT RATES ON LUMBER.

The Orillia *Packet* of a late date contained the following, which will, doubtless, be of interest to readers of the LUMBERMAN:

Before the Railway Commission, sitting last week at Toronto, Mr. J. S. Peckham favored the regulation of freight rates by the railway companies rather than by a court, constituted for that purpose. In the matter of special rates he had been treated impartially. He was of the opinion that the small lumber shippers, whose business was purely local, should not get the same rates as the larger dealers. He had not experienced any local discrimination, that is, between two towns. From navigable points the rates were lower in summer than in winter. That was owing to competition during the navigation season. The question of transhipment was one which a court might deal with advantageously. Mr. James Scott, Waubaushene, said that special rates were a necessity owing to the keen competition between railway companies, The establishment of a railway court would be of immense advantage in settling disputes which from time to time arise between railway companies and individuals. It would expedite a settlement at a small cost, and consequently would be of great service to the community. At the present time it was almost impossible to obtain justice, unless at considerable cost and delay. He preferred a railway court to the common law courts. The question of rates should be determined by the companies themselves. Mr. Thomas Long, Collingwood, said the rates were lower from competing points than from points where there was no competition. He understood there were special rates, but he had never got any. He had applied for special rates but was not successful in obtaining them. He complained of the discriminating rates on the Northern railway. He had been obliged to close up his flour mill two years ago and had not since opened it, owing to this system of discrimination. The proposed court, if established with full powers to deal with railway matters, would be a great benefit to the Dominion. Merchants were not permitted to ship mixed cargoes of a similar classification and if a carload consisting of one half sugar and the other half rice were shipped the company would charge what was called tariff rates, whereas if the load was entirely made up of either commodity the carload rates would be charged, which were considerably lower, notwithstanding that the carload rates were the same in both instances. Again, the railway companies do not hold themselves responsible for loss in transit of wheat through defective cars. Sometimes half of the carload fell through the cracks and openinings of old cars, which was a dead loss to the consignor. The terms of the contract were generally for four hundred bushels, more or less, but often they only delivered one hundred bushels and refused any compensation for the loss sustained by leakage. In fact the merchants were entirely in the hands of the companies.

A gang of shanty men arrived from the Nipissing district on Saturday last. They were employed on Mr. J. R. Booth's tow boats on Lake Nipissing forwarding logs to his new saw mill, which was constructed last summer on the edge of that lake. The winters cut on that limit has been secured in a boom, and the mill will run for about two weeks more.—*Ottawa Evening Journal.*

General News Notes.

Mr. McLaren will open a lumber yard in Kingston.

Two mills have been erected at Housey's Rapids this summer.

A shingle mill belonging to Mr. Love, at Port Sandfield, was recently destroyed by fire.

Joseph Ball, of Bracebridge, has invented a bow-facing-oar, which promises to be a success.

Mr. John Knight, of Elsie, is going to put a million feet or more of saw logs into his saw mill.

The bark Yuba with lumber for Buenos Ayres, after leaving Montreal grounded at Longue Point.

A large number of vessels were loaded with lumber at the Parry Sound docks during the past week.

The last lumber tows to leave Ottawa for the United States ports this season will start early this month.

James Davenport, of Midland, has the contract for building the new mill for the Victoria Harbor Company.

Mr. Bothwell is getting out a stock of pine and hemlock logs and shingle bolts for his mill at Cooper's Falls.

Several of the saw-mills at the Chaudiere have shut down owing to the coldness of the weather, and dearth of logs.

The average weight of 1000 superficial feet of Douglas fir lumber is from 3300 to 3500 pounds, and is worth from $9 to $25.

Several of Mr. Ullyott's shanty teams have passed through Peterborough for the north, giving quite a flavor of old times.

There has been an increase in the traffic of the Rideau canal. The lockages have been :—Steamers, 576; barges, 934 ; rafts, 35.

Mr. B. Adam, proprietor of the new shingle mill at Gatineau Point, went up the Gatineau recently in search of a timber limit.

The Rathbun company are setting out five or six hundred shade trees in the streets of Deseronto. Mr. Hopkins, Oswego, has the work in hand.

Two hundred feet of the Waubaushene dock was washed away by the big storm. About 20,000 feet of lumber was also washed from the dock.

The Waubaushene mills closed down a few days ago and all the men had a chance given them to go at once to the shanties so as not to lose any time.

The steam barge Nile and two barges are going to Kingston from Ottawa with 340,000 ft. of lumber. The steamer Reliance has been chartered to load lumber for Oswego.

Messrs. Gilmour & Co. have made an exchange of limits with the Messrs. Bronson, the former giving 170 square miles on the Kippewa for some 900 odd miles on the Gatineau.

Mr. J. G. Oliver, of Battleford, whose saw mill was burned down a few days ago, estimates his loss at $10,000 and does not possess a single cent of insurance. There is now only one mill in the district.

For the week ending October 23rd last, the Chicago building department issued 63 permits for 80 new buildings to cost $386,880, against 67 permits for 83 new buildings to cost $571,650 for the preceding week.

The Rathbun company has purchased from Folger Bros. the charcoal works at Sharbot Lake. The machinery, retorts, etc. will be removed to Deseronto where the experiment of charcoal making will be tried.

On the 19th Oct., at Carswell & Co's mill, Calabogie, there was cut 100,000 feet of lumber. This is pretty good work when it is considered that the gang only carries twenty-one saws thirty-four inches long, with a stroke of twelve inches.

In Wapella, Man., the firm of Logan & Howell, lumber dealers, have assigned. They were formerly farmers, and it is said possessed little means beyond their farms, which are heavily encumbered. They commenced in March last.

Messrs. G. Benedict & Son's law suit in connection with the Scott timber limits has been decided in their favor after lengthy litigation. This decision will have an important and beneficial effect upon the future prosperity of Deseronto.

Mr. Wm. Richards, the superintendent of the Upper Ottawa Driving Company, has commenced the construction of two new driving scows, those now in use being found too small for the large gang of men employed driving during the summer.

The tug Col. By and barges took their last load of the season at Burritt's Rapids on Nov. 4th for Cape Vincent. The tow has been freighting ties and posts for Mr. Hebron Harris all summer, who has an extensive contract with American railroads.

An epidemic of some kind has broken out in Booth's shanty on the Mississippi. Five men arrived at Dacre last Thursday, complaining of chilliness, prostration, vomiting, headache, and pain in the back. One was so low that a clergyman from here was telegraphed for.

The number of pieces of timber which passed through the Government works, on the Madawaska River, during the current season of 1886, was 811 880. This amount was composed of 20,011 pieces of square timber, 20,326 pieces of dimension timber, 761,805 saw-logs, and 9,738 cedars.

The Chatham Manufacturing Company received from the vicinity of Kent Bridge, the other day, an oak log measuring 73 feet in length and 30 inches in diameter, which would contain over 3,000 feet board measure.

A Minneapolis despatch says a synditate of Canadian lumbermeu, with partners in Minnesota, have acquired 500,000 000 feet of pine timber in that state, and will gobble up about one-half the state in timber limits. Treaties with the Indians on these reserves were, it is said, made in the interests of this syndicate.

An immense dry lumber shed is now being erected at Deseronto. It will be arched over and its dimensions will be 600 feet long and 40 wide. The whole work is under the supervision of Mr. E. H. Cooke who has been longing for such a shed for some time. He will surely be content with such a mammoth structure.

Ottawa lumber merchants cannot find sufficient railway cars, or boats for the transport of their lumber, and consequently shipments are largely hindered. Rail shipments will likely double this winter, which will be a great benefit to the city, affording a large amount of employment to laborers, and men having teams for hire.

A young man from Irwin's shanty had a portion of his foot almost completely cut off with an axe. He was brought down to this village on Sunday and had a portion of the injured foot amputated by Dr. Giles, who performed the operation with great skill and success. The young man is progressing favorably.—*Minden Echo.*

Messrs. Gilmour & Co., of Chelsea Village, closed their mills for the season a few days ago. They are getting out timber for the construction of a new saw mill at the Peche. The frame work and the foundation will probably be completed this fall, and the new mill will be in operation by the time the midsummer drives arrive next year.

There is quite a large fleet of vessels in the harbor loading lumber and a large number of vessels are expected before the close of navigation. We understand that several million feet of lumber which has been sold this fall will have to remain here all winter owing to the difficulty of chartering vessels on which to ship it.—*Parry Sound North Star.*

Mr. Robert Bick, of Bobcaygeon, has accepted a responsible and lucrative position in the Rathbun Co., at Desoronto, as manager of their shingle mill. Mr. Bick's skill as a shingle maker is such that the value of their shingles made has been considerably enhanced, and though he gets a good salary the Rathbun Co. will make a good thing out of it.

The Whitby *Chronicle* says that the failure of Messrs. Trounce & Co., lumbermen and millers, is the talk of the town this week. It is stated the liabilities of the firm amount to $100,000, the nominal value of the assets being put at a good deal less. The Ontario Bank is the heaviest creditor and is said to possess the only security held by anyone.

The Board of Trade has taken up in earnest the question of the graving dock advocated for Montreal by the *Witness*, and has addressed a letter to the Harbor Commissioners, stating that the immediate construction of the dock is necessary, and urging the Harbor Board to commence to agitate at once for the scheme, as well as to open negotiations with the Government.

A cablegram to the Halifax *Herald* from St. Pierre, Miq., says a large barque, laden with timber, was on fire nine miles south-west of St. Pierre on the 9th Nov, drifting east. She was ablaze from stem to stern. Her name was obliterated, but the word "Swansea" was visible. A tug went to the scene. The fate of the crew is unknown.

Mr. Allan McPherson's saw mill has been shut down, after a satisfactory season. The shingle mill will run all winter. Mr. McPherson has done a very good business this year, in lime and building stone. He has purchased the limits in the South Western corner of Oakley, and their farms, from Mr. R. C. Strickland & Co. ; also a limit in Ryde, from the Georgian Bay Lumber Co. He will get out a large stock for the mills for next year. His shanties are in full operation.

The "big trees" of California will soon be extinct. Seventeen lumber companies, owning from 3000 to 25,000 acres of redwood forest each, are waging a war of extermination with all the weapons known to the modern logging camp. The demand for the wood is unlimited and all the mills are kept at work to the limit of their capacity. The forests are large, but the forces employed against them are swift and irresistible.

The receipts of Southern yellow pine at New York from points in the Carolinas, Georgia and Florida, within eighteen days last month, exceeded eight million feet sawn. Savannah furnished the largest quantity, 1,452,000 feet. Brunswick nearly as much, then Jacksonville and Fernandina, both Florida ports. Wilmington and Georgetown and Norfolk sent the least. Darien furnishes in that period 500,000 feet hewn and 440,000 feet re-sawn.

About 100 lumbermen, engaged last week, have just left to work for the winter in the lumber business at Port Arthur. No little difficulty was experienced in securing the right kind of men. Many refused twenty-four dollars per month and "all found"; and several who have signed the contract, and left their valises and watches with the employing agent, failed to put in an appearance. Good men were guaranteed from twenty-four to twenty-eight dollars per month, all found.

Messrs. Thompson & Son, lumbermen of Peterborough, have commenced operations for the season of 1886-7. A gang of men have been at work in the township of Manvers for the last month or more, and when the winter sets in two more gangs will be dispatched to the Georgian Bay district and Ottawa River district respectively. Messrs. Thompson & Son confine themselves to the square timber branch of the business. Last year they got out a large quantity of white pine masts and other kinds of square timber. This year they will take out a considerable quantity of ash square timber for export to Europe.

The firm of Gilmour & Co. state that they have no camp known as Gilmour's Camp, and that the reported murder and outrage there is probably a fabrication. They have inquired of their agent at the the Desert, and he reports that nothing is known there of the alleged tragedy. The woman and her daughter said to have been the victims of the outrage were not living in the neighborhood, having removed to Mattawa some time ago. These statements pretty well discredit the original story as published in these columns, but it seems hard to believe that anybody would deliberately concoct such a horrible yarn, either for profit or amusement.

Several accidents have occurred in Mr. Jos. Gaudette's shanty at Barry's Bay, on the Madawaska river, during the past few days, one of which is of a serious nature. Peter Kelly, near Mount St. Patrick, was drawing logs through the bush at this shanty, when one of them swung round and struck a dry tree which broke off and struck Kelly on the back of the head, knocking him senseless. He was carried to the shanty and cared for by his fellow workmen. Two days after he took sick fits, and Dr. Kinder was called in, who administered to the sufferers wants as best he could. We understand that Kelly's mind is deranged through the effects of the blow. There are six men laid up in this shanty with cuts, bruises, etc.

A few days ago the additional applications made for timber berths at the New Brunswick Crown Lands office, were disposed of by auction, all the applicants obtaining the lands at the upset price, without competition. The licenses issued were as follows : Mr. Henry O'Leary obtained lot No. 47, Upsalquitch River, 2 square miles, and No. 48 Upsalquitch River, 2 square miles ; Mr. Charles Tracey obtained No. 49 N. E. branch, Yoho stream, Sunbury, 2 square miles, and No. 50, head of Little River, Sunbury, 2 square miles ; 2 square miles in the same locality went to Mr. George Hunter ; No. 51, Nepisiguit River, 3 square miles to K. F. Burns. Further applications have been made for twenty-one miles of timber berths, which according to the *Gleaner*, are to be sold this week.

A couple of months ago a raft of 3,000,000 feet of logs was made up at the mouth of French river, Georgian Bay, to be towed to East Tawas for the Emery Lumber Company by the tug Mocking Bird, the contract guaranteeing the safe delivery of the logs. The tug pulled on the raft eight days in bad weather and then abandoned the job temporarily, engaging in wrecking expeditions. Two weeks ago she went back and took hold of the raft, and got out into Lake Huron, when a big blow came on and she was obliged to go back under the lee of the islands at the mouth of the bay where the raft lay at last advices, and as the weather has been unsettled since it is uncertain when the raft will be delivered. The Kate Williams brought over the log barge Wahpoerotie to Tawas with a cargo of logs last week.

The steam barge Nile with her consorts, the Isis and Bedford, have finished their season's work on the Rideau Canal. They have not met with an accident, a fact much to the credit of the Captain and Engineer. The Dominion Government should deepen and improve the Rideau canal without delay. It is becoming more and more prominent as a factor for the economic movement of lumber and farm products. Many steamers are plying on that route, on which are many flourishing towns, such as Smith's Falls, Merrickville, Westport, &c. It is an exceedingly pretty route for tourists to Ottawa and other points, and with deeper water an increased army of American tourists from the Thousand Islands would patronize the route. Members from Central Ontario should press upon the Government the importance of improving the canal and that without delay.—*Deseronto Tribune.*

The fire at Conroy's Mill, Deschenes Lake, was confined to the lumber yard where it originated, although for a time it appeared as if it might make a clean sweep of the mills and village. Three acres of piling grounds were burnt over and the fire continued to smoulder all night but was carefully watched lest it should be communicated to the other property. It is supposed to have originated from the pipe of some smoker, although smoking is strictly prohibited on the grounds. The mills had not been in operation for two years, consequently the docks were clear of lumber. Mr. N. E. Cormier, M.P.P., of Aylmer, on hearing of the fire, immediately closed down his mill and sent his men to assist in putting it out, while the C. P. Railroad generously put an engine and train at the disposal of such Aylmerites as desired to go to the fire. The two companies worked away with a will, but, notwithstanding their efforts to extinguish it, the yard burned with great fierceness all the afternoon, being filled with comparatively dry material. The fire was conquered at about eight o'clock in the evening. The main property, the saw mill, grain elevator, and grist mill were not damaged in the least as well as the numerous other buildings on the premises. The whole property was insured for $80,000, but the damage sustained is comparatively light.—*Ottawa Evening Journal.*

THE CANADA LUMBERMAN

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. MORTIMER, PETERBOROUGH, ONT.

Terms of Subscription:

One copy, one year, in advance..... $1 00
One copy, six months, in advance 0 50

Advertising rates furnished on application.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER, Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MASSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

Our Readers who write to Advertisers in this Journal, will oblige both the advertiser and Publisher by mentioning the 'Canada Lumberman."

PETERBOROUGH, ONT, DECEMBER, 1886

A LARGE amount of interesting editorial and news items has been laid over until next issue, owing to a too great demand on our space.

THE area of timber limits under license on the Ottawa, in the province of Quebec, is 9,732 square miles; in Ontario, 7,153 miles.

AN International Exhibition of a peculiarly interesting character—that of Railway appliances and Industries—is to be held in Paris from May to October, 1887.

THE death is reported of William Sharples, head of the lumber exporting house of Sharples & Co., Quebec, which occurred Nov. 10 He was a very prominent and highly esteemed member of the trade in that city.

W. G PERLEY, lumberman, Ottawa, is in the field as a candidate for election to the House of Commons. Mr. Perley runs as an avowed supporter of the conservative party. C. H. Mackintosh may be thrown aside.

THERE seems to be a big trade doing between the "Flowery Land" and British Columbia, as we learn by latest from Vancouver that the ship *Beaconsfield* was loading with 1,020 000 ft. of lumber, value 11,800 dols., for Peru, and the barque *Nanaimo* was taking 45,000 ft. to Tientsin, China.

THE Export Lumber company of Montreal and New York report the total shipments of lumber from the river St. Lawrence to the river Plate during the season of 1886 as 29,088,204 feet, of which 21,782 604 feet was pine and 7 305,600 feet spruce. The total shipment in 1885 was 31,344,543 feet and in 1884, 36,938,548.

THE quantity of square timber, dimension timber, saw logs, and cedars which passed through the Government works on the Madawaska River during the summer of 1886, is as follows:—Square timber, 20,011 pieces; dimensions and boom timber, 20,326 pieces; saw logs, 761,805; cedars, 9,738. Total number, 811,880.

WE have received Vol. 1, No. 2, of the *Kansas City Architect and Builder*, a neat 16-page monthly. It is carefully edited, and the engravings and general typographical make-up are first-class in every particular. Publications of this nature are plentiful across the lines, but the new aspirant looks healty enough to live to a good old age.

MAKERS of wood-working machinery, both in Canada and the United States, have done an unusually large trade during the past year. The extensive improvements which are from time to time being introduced in this class of machinery has extended the field of usefulness, and almost entirely done away with manual labor in wood establishments.

IT is evident that throughout the United States and Canada, hemlock is gradually gaining ground, and the prejudice which has existed in the past regarding this wood is slowly but surely disappearing. The already rapid decrease in the volume of white pine will of itself have the effect of bringing hemlock in more general use for dimension and bill stuff.

"THE FOREST AND FARM LANDS OF NEW BRUNSWICK" was the title of a paper read at the Colonial and Indian Exhibition recently by Mr. W. F. Best, analytical chemist, of St. John, N. B. A number of limelight views of scenery, &c., specially prepared to illustrate the paper, were exhibited, together with samples of forest and farm products.

MESSRS. MCCOOL, DORAN & Co. have received at Quebec a raft of square white pine timber, containing about 100,000 ft. square and 60,000 waney, with an average for the latter of about 54 ft. 18½ in. girth. This has been taken. we are informed, from Lake Esperance, on the Ottawa River, about 45 miles further up than any yet taken from the Ottawa district.

AMONG the many new advertisements constantly appearing in this paper, we have pleasure this month in calling attention to that of Messrs. Northey & Co., Toronto, manufacturers of steam pumps. Many of our readers are already familar with this firm, but since there last announcement in the LUMBERMAN, extensive improvements have been made in their celebrated pumps, which entitle them to rank second to none in the market.

ONCE more we would make a strong appeal to our readers who are in want of machinery, and who write to our advertisers, to be always particular to mention the LUMBERMAN in every case. The favor we ask incurs no extra work on the part of the correspondent, but always helps the paper. Will our friends kindly bear this in mind, and we shall endeavor to reciprocate the favor by supplying the LUMBERMAN in the most entertaining shape possible.

A FEW days ago we took a jaunt over the Northern and Northwestern Railway from Toronto, and were particularly struck with the new and elegant coaches which have recently been introduced on the main line. With the opening up of the Calender branch of the C. P. R. the Northern railway is likely to become a first-class line. Manager Barker and the officials of the Northern deserve credit for the extensive improvement now being made.

FOR the first time the LUMBERMAN takes pleasure in introducing to its readers the well known firm of Cowan & Co., of Galt, Ont., manufacturers of all kinds of wood-working machinery. From our personal knowledge of this firm's manufacture, we have no hesitation in saying that their machinery stands second to none manufactured either in Canada or the United States. All interested in this class of machinery should send for catalogue, and read the announcement in this issue.

THE tests of Colonial woods recently made in England, an abbreviated report of which appears on another page of the LUMBERMAN, certainly did much to bring the superior qualities of some of the timbers of Canada before the notice of those in the old land interested in their employment. Among the Canadian specimens submitted to this practical test were the Douglas fir, and swamp or black ash, butternut, white fir, and iron wood, all suitable for various forms of joiners' work.

THE English Commissioners of Forests are planting extensively on the Crown property in the Isle of Man. About four millions of trees have been planted on mountain land during the last three years, and the work has proved so successful that it has been decided to extend the number of trees annually. The planting is done almost entirely by native labor, under the superintendence of a competent forester. What a grand area there is in the great Northwest of Canada to carry out a similar project.

MICHIGAN and Canadian lumberman will be interested in the fact that plans are being made for the deepening of the channel of Niagara river from Buffalo to Tonawanda to 18 feet. There is barely 14 feet at present and the channel is so circuitous that the passage of vessels heavily laden is attended with much difficulty and danger. Though it has often been desirable to load boats bound for Tonawanda more deeply than is the present custom, the narrowness and shallowness of the course has deterred owners and shippers.

MR. A. W. WRIGHT, commercial agent for Canada at the Colonial and Indian Exhibition, who has just returned to Canada, during the course of his remarks to an Ottawa reporter said:—"There is also a fine demand for Canadian timber, not, however, the timber which grows in the forest and which is the only kind manufactured here but the second growth which grows in the clearing. I found out that if this second growth timber which is now considered by lumbermen as useless, on account of its small size, was manufactured and sent to England it would meet with ready and good sale. There is also a fine market for Canadian hard woods, but they must be carefully manufactured and selected in order to meet with ready sale.

AN order in Council has been passed amending the present regulations relating to railway lands in British Columbia along the route of the Vancouver Island Railway. The amended section reads. "No timber shall be granted for a larger area than 2,000 acres of land for each 25 000 feet board measure of lumber that the mill operated in connection therewith is capable of cutting in twelve hours, nor shall the license be granted for a longer period than five years. The license shall not be transferable and may be surrendered at any time.

THE secretary of the Lumberman's Exchange, of Chicago, has been granted a 30 days leave of absence, and in company with another well known lumberman, started *via* Canadian Pacific railway, a few days ago, for Victoria, British Columbia. The party intend visiting the newly discovered anthracite coal mines at Bauff, in the Rocky Mountains, and propose spending a week camping in the forests of the Pacific slope. We shall endeavor to obtain from Mr. Hotchkiss his views concerning the great timber resources of the Pacific province of the Dominion on his return.

AT last, after months of discussion, the question of a lumber exchange for New York, has assumed practical shape. Consignors of hardwood lumber to that city have been considerably inconvenienced in the past by the faulty inspection methods which have afflicted that center of trade, and it is conceded that the present organization will do away with all difficulties as well as many others. The new institution already appears to be in good working shape, with abundance of officers and committeemen. The reports give promise of something new and possibly definite in regard to the inspection there.

THE current issue of *The Office*, published monthly in New York, a copy of which has been sent us, contains much that is of interest to business men and accountants. In the first place, as an enterprise it is unique. It is the only paper appealing to office men and devoted to the advocacy of better methods in office work. Of the contents of the November number we were particularly pleased with the articles entitled: "Wanted—a book-keeper;" "The Calender—old and new styles;" and "A system of cost records for foundry work." The cost of this publication is only $1 per annum, and it should succeed.

VERY little, if any change has taken taken place in the English lumber market since our last issue. The same dull and depressing influences which have been at work for many months past still exist, the demand remaining restricted and the imports in excess of the requirements. One or two important failures have been chronicled, the principal one being a large builder and contractor at Chelsea, with liabilities of about £220 000. Each recurrence of such events further weakens the already instable condition of the trade, and it is generally thought that the next few months will be an anxious time in more quarters that one.

THE sixth volume of the LUMBERMAN is brought to a close this month, and a new volume will commence with the January number. Improvements will further be made in several important mechanical details, and the best possible attention will be exercised in the editorial conduct of the paper. The editor feels that in some degree he has now learned the wants of his constituency of readers, and that he is therefore better prepared for the future than in the past to serve them acceptably. The policy of the paper will be the same as in the past, namely, serviceable and instructive to all engaged in the branches of trade which the LUMBERMAN claims to represent.

IT is of service to observe what sort of wood is exported to foreign markets by our American neighbors. We find, for example, that the shipments of wood from the port of New York from October 13th to 30th last, included cedar to Belgium; cedar, oak and walnut to France; cedar mahogany, pearwood, walnut and white-wood to Germany; white-wood to Holland; pine lumber and shingles to Hayti, Porto Rico and the British West Indies; hemlock, maple, cedar, persimmon wood, oak, mahogany, walnut and pine to Great Britain; pine (315,000 feet), besides ash, oak, poplar and walnut to the Argentine Republic; pine (222,000 feet) and planks to New South Wales.

A PACIFIC cable company, which proposes to make telegraphic connection between England and Australia, *via* Canada, is about to appeal to the public with a prospectus asking a capital of £2,000,000 stg. An Imperial and Colonial guarantee of £100,000 is said to be looked for: Canada being set down for £12 000, Australia for £38,000 and the Imperial government for £50 000. Hawaii has promised £4,000 a year, and it is admitted that this is the only promise so far obtained. It is very doubtful whether the £100,000 subsidy will be got. A six-penny Atlantic rate; five cents across Canada; four shillings a word from Canada to Australia, are said to form part of the scheme. There is and indisposition on the part of the British public to believe that all this will be accomplished; and the details may very likely be modified before the propectus, of which a draft has been made, is finally decided upon.

WE have pleasure in again calling attention to the advertisement of the William Hamilton Manufacturing Co., of Peterborough, which appears on second page of cover. We shall refer to this firm at further length next issue.

FOREST LEGISLATON IN CANADA AND THE UNITED STATES.

The course pursued by the Dominion Government in placing an export duty of two dollars per thousand feet upon spruce and pine logs, has aroused the American press and public to a sense of their true position regarding the forests of that country. After many years of unnecessary slaughter, Americans find that their timber resources are rapidly giving out, and for this reason the lumbermen of Michigan and Wisconsin, in particular, have, during the past year or two, turned their attention to the forests of Canada. They quietly bought up the right to cut over extensive tracks with the intention of having the logs towed across the lakes and cut up in their own mills. There would have been a double advantage in this operation; material would have been supplied to feed established mills, and the manufacturers would have escaped the import duty of $2 per thousand feet of manufactured lumber, imposed by the Government of the United States on all foreign white pine and spruce entering that country.

The Dominion Government very wisely does not sell its forest lands, but only the right to cut timber on them under certain restrictions, and has failed to see the advantage of such operations, taking the ground that as long as the market for Canadian lumber in the United States is restricted by an import duty, American citizens, if they want to manufacture Canadian lumber, must do it in Canada, or pay a good round price for the privilege of sawing it at home. No unprejudiced person would attempt to deny that this is the only wise course to pursue. This is not the opinion, however, of the owners of saw mills situated on the shores of the great lakes within United States territory. They are loud in their denunciations of the short-sightedness of the Canadian policy, and foremost among these critics we find certain class and other journals of the Northwest, which, strange to say, in the past upheld with the greatest persistence the wisdom and necessity of collecting an import duty upon lumber manufactured in Canada, "Consistency thou art a jewel!"

The New York *Sun* in treating upon this question has the following to say:—

"There should, of course, be free trade, or, at least, reciprocity in lumber. It is monstrous that things should be allowed to go on any longer as they are. It is an outrage upon American prosperity; it is a disgrace to American intelligence that we should continue to shut out Canadian lumber from the markets of the United States. The whole country is made to suffer in order that a handful of pine land owners and manufacturers may become inordinately wealthy. Every building erected in the Northern States is made more expensive, every Northern farm is made less valuable in the increased cost of fencing by this duty. It causes an unnecessary and inexcusable exhaustion of our northern forests. It is a shame and an outrage which the American people cannot longer afford to submit to."

With the already heavy export duty, and the possibility of this being increased at the forthcoming session of the Dominion Government, it is evident that the Americans will have to adopt some policy calculated to better their condition. Our contemporary above quoted seems to think that it has found a way to get out of the difficulty, by doing away with the protective duty on Canadian lumber and placing it on the free list.

But the question of duty alone is not the only consideration with Canadians. Every one is familiar with the fact that in Canada we have an almost unlimited supply of all kinds of timber, but the country is still in its infancy, and with the great influx of population which is sure to come to a country boasting of the natural advantages of which we are the possessors, the fact is apparent that we cannot afford to slaughter our forests to any great extent for foreign export. While, as we have said, we have immense timber resources, it is also a fact that we also have a great track of prairie country, the demand from which will be great a few years hence. Foreign export would, of course, temporarily enrich our lumber manufacturers and dealers and the public at large, but this should be a secondary consideration, when future requirements are taken into account. If this matter was more fully taken into consideration more drastic and comprehensive measures to prevent exportation would be resorted to.

THE BOUNDARY QUESTION AGAIN.

The famous appeal of the St. Catharines Milling and Lumber Company, appellants, and the Queen, on the information of the Attorney-General of Ontario, involving once more the much disputed boundary question, was argued before the full bench of Supreme Court, at Ottawa, on Saturday, Nov, 27th. Mr. Dalton McCarthy, Q C., appeared for the appellants, and Hon. David Mills, Q C, for the Ontario Government.

The case is an appeal from the judgment of the Court of Appeal of the Province of Ontario, delivered in April last affirming the judgment of the Chancellor of Ontario, declaring that the appellants had no right to cut timber on certain lands mentioned in the Statement of Claim, restraining them from trespassing thereon, or from removing any timber standing or already cut. The land on which the lumber company operated, according to the assertions of the respondents, lies in the Western part of Ontario, north of the height of land, and is a portion of the territory, which at the time of Confederation, was claimed by Canada as part of Upper Canada, but the right to which was disputed by the Hudson Bay Company. The right of Upper Canada to this territory had been asserted and insisted upon by the successive governments of the Province of Canada for many years before Confederation, and continued to be insisted upon by the Dominion Government until 1870. The Federal authorities in that year effected a compromise with the Hudson's Bay Company, the latter surrendering all claims to Her Majesty. By an Order-in-Council passed in June 1870, the Dominion was given Rupert's Land and the North-West Territory, not theretofore belonging to any province. However, the Territory which includes the land involved in this suit belongs to the Ontario Government.

The St. Catharines Milling and Lumber Company on the other hand, maintain that the lands upon which they operated belong to the Dominion; that $4,125 was paid for the privilege of cutting the timber. The grounds upon which the appellants based their contention that the lands and timber in question are the property of the Federal Government are several in number. One was that the land in question was until recently claimed by the tribes of Indians who inhabited that portion of the Dominion, and the claims of these tribes have always been recognized and admitted by the various Governments and by the Crown, and such Indian claims are and always have been, paramount to the claims of the Province of Ontario. The appellants also hold that the Federal authorities in consideration of a large expenditure of money made for the benefit of the Indians of the Lake Superior district, have acquired by purchase the Indian title to the land and the timber located thereon and by reason of the acquisition of this title as well as by reason of the inherent right of the Crown, the Dominion and not the Province of Ontario, has the right to these limits.

The respondents assert that the defence is made and carried on at the expense of the Dominion Government. The case in the courts below has so far gone in favor of Ontario. Mr. Walter Cassels, of Toronto, as well as Hon. Mr. Mills are watching the proceedings on behalf of Premier Mowat.

EXCHANGE ECHOES.

Contemporary Opinion on the Various Matters of Interest to the Trade.

Monetary Times.

The statement is made without qualification, though it appears to lack confirmation, that the Grand Trunk railway is to form a connection with the Northern Pacific, and that an arrangement to that effect has been made. A road is being built on the south side of Lake Superior, which will connect with the Northern Pacific, at Duluth, and with the Grand Trunk at Sault Ste. Marie; the latter company extending its line from the Midland, near Atherley, to Sault Ste. Marie, crossing the French river on its way, near the mouth, where a series of islands will make the bridging easy. The capital necessary to carry out this project, it is added, is at the disposal of the Grand Trunk. The expectation is that a large traffic will be drawn by this road from Oregon, Wyoming, Dakota and Minnesota, and part of Wisconsin.

Boston Journal of Commerce.

Cold weather is coming on where there will be an increased demand upon the boilers to supply the steam for heating, new risks to incur new points to look out for, and more work for the engineer. Don't let it come upon you all at once but get ready for it. Give your plant a thorough overhauling and get it into the best possible condition. See that there is no possible place where freezing can cause you trouble. The feed and water pipes, especially those which convey hot water, are apt to become choked by corrosion in a year's use. Now is a good time to clean or replace them. See that the valve stems and joints about the mill are tight so that you will not be called in twenty directions at once to stop leaks the first time steam is let on. An engineer can make his own situation a great deal more comfortable, and give a great deal more satisfaction to his employers by exercising a little forethought in such matters.

The Timberman, Chicago.

It is gratifying to note that the observer who has been so long in the work of investigating northwestern market conditions that not long since he fell into the error of gravely asserting that there was "no pronounced scarcity of stock anywhere," is beginning to realize what has been plain enough to most members of the trade for weeks back—that there is less lumber in sight than there has been at this season of the year for a long time. That "the trade will go into winter quarters with certainly no more lumber than will be required for an ordinary spring demand," is surely putting it very mildly. More than this is really true. As a matter of fact the supply of dry lumber—which in these days of pound freights is all that can be regarded as entering into consideration—is so much less than an average demand warrants the trade in carrying over, that there is every reason to look for much difficulty in filling orders. The lack of assortments is already sufficiently "pronounced" to make it evident, and it is due to the welfare of the business and of its members that the fact should not be ignored or its importance underrated.

Timber Trades Journal, London, Eng.

The comparative state of the dock deliveries is generally the first thing the trade turn to in the hope of finding some signs of improvement, but latterly we have been unable to say that things in this respect were any better. Last year's consumption compared with the present is decidedly unfavourable, and leaves us to make up a shortage of over 23,000 standards. The present season is fast approaching its conclusion with something like half a million pieces of deals and battens less than the stocks a year since exhibited. This considerably helps the market, and affords some grounds for prices advancing with the spring, before there is time for the new season's goods to put in an appearance. With regard to flooring boards, these depend entirely on the consumption, which, fortunately for them, has kept fairly good all through, and had the market not been so overborne with battens this year the probability is that prices would not have gone below last year's. Shippers made a great reduction in cargo quotations some three years ago stocks being heavy and the markets here dull. The unwisdom of this policy has been observable in the difficulty that has since been experienced in getting back to their former value. Shippers on the Baltic side at one period in the history of the trade used to regulate the markets here, but since the production has so enormously increased there is always sufficient stock carried forward to prevent any scarcity.

Northwestern Lumberman.

The lumber trade has reached such an over-zealous state that there is an actual competition between buyers to see who shall get the better cuts of the mills. This strife is most active between eastern and western buyers at lake points. Throughout the present season, until recently, competition among buyers at manufacturing points has been so sharp that much of the profit of this year's business has been lost to the dealers simply because values of bulk lumber have been forced a little higher than was warranted by the distributive demand. As a matter of fact nothing has been developed this year to give lumber at the mills any basis for higher prices than prevailed last year. The consumptive demand, while this year greater in some directions than it was in 1885, has not, on the whole, shown any appreciable gain. It has lately been observed that buyers at the mills have not been plenty. The trade has about all the lumber it wants until a more urgent consumptive demand is developed. This shows that the excitement in the lumber trade has, the present season, been at manufacturing points. Eastern buyers have been plentier than usual at western points, so that western dealers had to go into competition, with them in securing stocks; but all the time the latter have known that they were running some risk in doing so. The present dilemma does not necessitate loss on stock in yard, however. The promise of a good trade next February, March and April is encouraging, while stocks are scarcely ample for an urgent requirement. A lively spring trade would take the dealers out on to solid ground again.

The Timberman, (Chicago.)

Paper by the ream, lead pencils by the dozen, and printers' ink by the ton, have been used up in years past to urge upon lumbermakers the necessity of economy in all their works. And in particular has it again and again been set forth with all the vigor and eloquence that is inseparable from editorial utterances, that they should study and plan—even if it should be necessary for them to lie awake nights to do it—to the end that every portion of the mill product should be made to bring in something, be it little or much, in the way of hard coin or crisp paper that will serve to make a balance in the bank. Possibly it is because such advice fell into fruitful soil, but the chances are more probably because the natural tendency of the business has long been in this direction, that so little of the contents of the log as it floats down the stream, fails to reach a market and transform itself into cash. Even the saw-dust sells at some mill points, and the edgings and refuse are made to serve a profitable purpose. The short lumber and ends which were once piled up in the water to make docks, now find a market, when the mill man is enterprising enough to seek it out. Not all mill men or lumber dealers may know that lumber has been sold on Lake Michigan this season only eighteen inches long, and from that up, in lengths increasing by six inches, but it is nevertheless true, and true also that good prices were obtained for it. One mill owner sold a quantity under ten feet long—stock which was formerly considered not worth shipping. For lengths of eighteen inches and up to forty-two, $3 50 was obtained for the culls, and $5 for the common and better, delivered in Chicago. For four and five feet the price was $4 25 for culls, and $12.50 for the good stock, while for lengths over five feet $18.50 was realized, the stock running in quality equal to about A select. The average on about 1 500 000 feet of such lumber sold, reached $11.70, which it must be admitted is better than using the stuff to make new docks. The lumber was bought and used for manufacturing purposes, and doubtless answered the buyer's end nearly as well as if it had been of the lengths recognized as standard by the trade. The demand for such odd stock will unquestionably become a feature of the trade and lumber makers will be doing themselves good service to cultivate it.

Steam Engines.

A young man in the interior of Iowa has invented a change in the construction of engines. He dispenses with the steam chest and the governor-balls, and in place of the latter he employs a pendulum which permits the outflow of steam at an unvarying speed, but the slightest increase of velocity in the engine lessens the time that the steam has to escape into the cylinder. The apparatus thus effects an instantaneous check upon its own irregularities, which are comparatively slow when the governor is used, and it has the additional advantage of using less steam while it largely simplifies the working gear. A trial engine has been constructed, and is said to work well.

EXTRA HEAVY PLANER AND MATCHER.

WE illustrate on this page an Extra Heavy Planer and Matcher, manufactured by the Egan Company, Cincinnati, Ohio. It is one of the best and most improved machines of its kind made, and the detail of i s construction for strength, strain and convenience, is of the most improved and advanced ideas for building first-class machines. All the latest points are embodied, and many new advantages specially peculiar to our machine, and covered by our exclusive patents.

The Frame is cast plain, and is thoroughly braced and ribbed on the inside, giving great strength and presenting a very smooth and even face on the outside. The edges are gracefully curved so as to nearly double the strength of the castings.

The Head is of cast steel and slotted on all four sides, and the cylinder is double belted. Any kind of a knife can be placed on this head, as the double pressure bars on each side of knife are adjustable to or from the knife. Mouldings, patent siding, cove siding, ship lap, beading, and work of that clsss can be done on it to the best advantage.

The Patent Adjustable Pressure Bars are placed on each side of knife and inside the feeding rolls, holding the lumber firmly as it is being planed. These bars are adjustable at will of operator, so as to accommodate irregular knives and allow a full clearance.

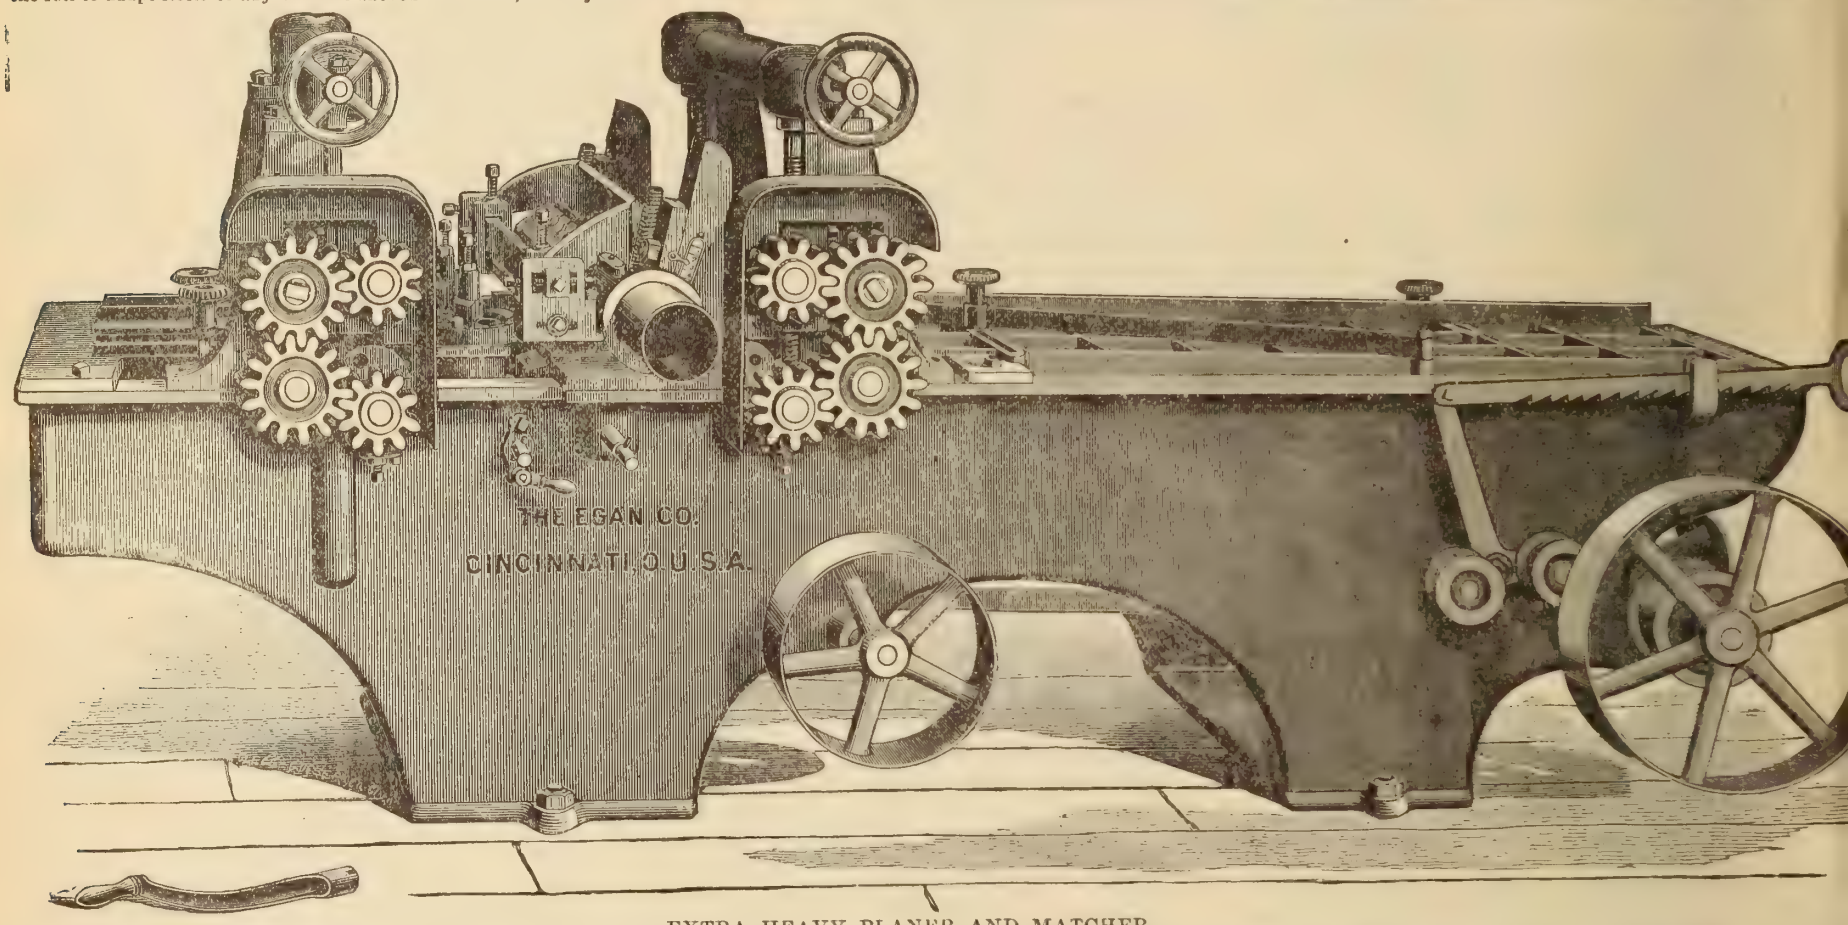
The Feed is powerful and consists of four 6 inch feed rolls, geared in a superior manner; there are two changes of speed, viz: 45 and 65 feet per minute. The machine is of large range, planing 24 inches wide, 6 inches thick and matching 14 inches wide. Our patent adjustable box is a very ingenious contrivance, allowing the roll to adapt itself to any board of uneven thickness, thereby preventing any undue strain to gearing and giving equal pressure to each side of board.

The Patent Side Heads, with their spindles, are adjustable horizontally or vertically from the working side of machine. When side heads are set for a certain width, a hand nut locks it and no slipping can take place. The machine can be changed from a planer to a matcher and vice-versa in one minute, and the mechanism for changing heads out of the way so as to surface full 24 in. wide is the most perfect and reliable yet put on any machine. The back feeding rolls are weighted and the front ones have springs and we think experts will appreciate the change.

This machine will stand up to any kind of heavy or light work ash, oak, yellow pine, white pine or hard wood, and is specially adapted to large mills requiring a variety of work in both planing 24 in. wide and 6 in. thick, also for flooring, ceiling, patent siding, moulding, &c., &c., and we can recommend it in every way to be well bui t, and the material the best adapted for the purpose.

The L. and T. pulleys are 14x8½ and should run 960 revolutions per minute.

For cuts and prices of this or any other Improved Wood-Working Machinery, address the manufacturers, the Egan Company, 165 to 185 West Front St., Cincinnatti, Ohio, U.S.A.



EXTRA HEAVY PLANER AND MATCHER.

CANADIAN TIMBER.

At a largely attended meeting of the members of the Institute of British Carriage Manufacturers, held in the Westminster Town Hall, London, Eng., Professor John Macoun, F. L. S., Botanist to the Canadian Government, read a paper on "Canadian Timbers suitable for Carriage Building," in the course of which he suggested that if a timber bureau or exchange were organized in connection with the contemplated Imperial Institute, dealers might be made aware of the anticipated wants of consumers, and producers could be instructed accordingly. The following is a summary of Professor Macoun's paper:—

"Commencing with a sketch of the lumbering centres of New Brunswick, Quebec, Ontario, and British Columbia, the Professor showed that there need be no uncertainty about the supply. Were there (he suggested), a timber bureau or exchange organized in connection with the contemplated Imperial Institute, dealers might be made aware of the anticipated wants of consumers, and producers could be instructed accordingly. There need be no fear of the supply of spruce and larch, and of the coarser kinds of pine lumber, giving out, as Canada had immense tracts, unfitted for agriculture, covered with this class of timber. It was true that fires did great damage every year, but that applied more particularly to pine forests, as these grew on dry and generally sandy soil. Fire passing through a Canadian forest simply means the re-covering of the land with a different variety of tree, as pine lands, if the soil be fairly good, seldom become covered with pines again. Proceeding then to speak of the suggested School of Forestry for England, Professor Macoun went on to treat the real object of his lecture. The elastic woods valuable for carriage building included the shell bark hickory, bitter nut hickory, white-heart hickory, pig-nut hickory, white ash, black ash, rim or red ash, chestnut, cherry or black birch. Elasticity he considered to be a property of young wood, and the greater the exposure the more it is produced. Should this be a fact, there was no reason why Canada could not produce all the ash and hickory for every variety of agricultural implement and vehicle required in England. Canada had millions of acres of waste lands growing up with young wood, which to-day were of no value, but which in twenty years, if merely let alone, would fully supply the English market as well as the Canadian. The Canadian woods noted for toughness were basswood, common or white elm, rock elm, slippery elm, beech, hornbeam, ironwood, walnut, bitter-nut, white oak, blue oak, pin oak, grey oak, scyamore, red maple, whitewood, cottonwood. Toughness, the professor showed, was found at all ages of the wood. The three Canadian elms, common or swamp elm, rock elm, and slippery elm, are in their young state so tough that in many cases it was impossible to split them. He had seen thousands of young elms ranging from six inches to eighteen inches cut down close to Canadian railways and burnt upon the ground because they were so tough that they were almost useless for firewood, and not worth the labor of converting into firewood. Did English purchasers and Canadian producers understand their business better, these small trees would be cut up in Canada of the required size, or merely cut into plank and shipped to England when partly dried. Or, better still, English capital, managed by competent men in the interest of the manufacturer or dealers in England, could produce just what was wanted and forward direct, so that the heavy charges now paid to middlemen could be dispensed with. There was now in Canada, around the old settlements, in fence corners and in the forest, cut many years ago, an enormous quantity of young wood ranging from twenty to sixty years of age which is considered of no value, as there is no demand for it. This is the class of wood they want but cannot get in England, because their own country does not produce enough of it. British dealers rejected Canadian forest-grown wood and say it is of second-class quality, and that Canadian woods are far inferior to British. Yet they could get the wood they desire by changing their mode of purchase. Let any competent man go out to Canada and have a lot of young oak, ash, elm, and hickory sawed up into plank of the size wanted, let it be partly seasoned, and then shipped direct to the manufacturer. Then they would get good cheap raw material, and with machinery and skilled workmen there was no reason why they could not build carriages of better quality and more cheaply than they did at present. The Professor then went on to treat of the need of Canada for a Forest Department, and spoke of their hardness, resistance to wet the beauty of many Canadian woods for cabinet making and furniture, as well as their uses for cooperage and the possibilities of the import of wood pulp. The paper indeed dealt exhaustively with the whole subject and was well received throughout.

LUMBERING IN MANITOBA.

This winter promises to be a brisk one in lumbering circles, the past season having been a very good one. "We could easily have handled 2,000,000 more feet than we did," said a member of a well known lumber firm. "During the past summer the cut of last year has been all sawn and disposed of and the stocks of sawn lumber and logs on hand have had large inroads made into them. If the demand next summer is to be met, there will have to be a much larger cut than last season; we as only one of many firms, will increase our cut by three millions of feet."

Other lumbermen spoken to corroborated this view of the case. During the past season there has been a heavy demand for good lumber for railway bridge purposes, and three times as great a quantity was used for this work as there was in 1885. From Winnipeg and all points of the Northwest there has been a demand for lumber, which indicates that building operations have been heavily carried on during the past summer. All the mills have been rushed to their greatest capacity. Prices are stiffening and are now from $14 to $15 per thousand feet f. o. b. at Keewatin, and from $17.50 to $18.60 at Winnipeg. They are expected to range still higher next summer if the market is not gutted by too heavy an output. One dealer estimated that there was yet 30,000 feet of sawn lumber remaining over from past years when the output was far in advance of the demand; if this winters cut was not so large, next season would relieve the dealers of the stocks on their hands, and place the business on a firm foundation again.

A good many lumbermen did not get all their last winter's cut down to the mills last summer, the drives sticking owing to the lowness of the water. There are probably three or four million of feet at present on the rivers waiting for the spring freshets to bring them to mills.

The season now opening promises to be a most active one; and lumbermen are consequently in good spirits. Gangs of men are already being sent to Lake Winnipeg and the Lake of the Woods districts, and a week or two will see operations in full swing.—*Free Press.*

COLONIAL TIMBER.

The last issue of the LUMBERMAN contained a brief notice of a meeting held in London (Eng.,) for the purpose of testing the various kinds and qualities of colonial timber. We are indebted to London *Timber* for a full report of the proceedings, but as our space is limited we have summarized the report, and only report that portion of the speeches referring more particularly to Canadian woods. The meeting was made up of a large number of colonial visitors, together with some of the leading civil engineers, builders, timber merchants, and others interested in the employment of timber, and was held, by special invitation at the Chelsea works of Messrs. A. Ransome & Co., in order to witness a series of practical experiments with different kinds of colonial timbers at present commercially unknown in England, but to the peculiar qualities and advantages of which it was desired to draw attention.

The experiments, which were conducted with more than 40 different varieties of timber from India and the colonies, comprise tree felling, cross cutting, sawing, planing, moulding, mortising, tenoning, and boring; while the manufacture of such things as casks, doors, pick handles, carriage spokes and railway sleepers was carried to its completion and the articles exhibited to the assembled guests.

Mr. Woods, the chairman, on rising, said that it was a great satisfaction to him to see so many distinguished representatives of the colonies present on this occasion. The object of this opportunity that Mr. Ransome has given us is, as I understand, to bring the woods which are the growth of the colonies to the notice of civil engineers, contractors, and others interested in the use of timber in the various branches of trade, and to give the colonists themselves an opportunity of showing what their respective countries will produce. We have had before us splendid samples of wood from various colonies, and we have seen how readily they can be operated upon, and brought into various forms by the machinery in these works. It would be interesting, I am sure, to the gentlemen present if we could have the views of our experienced colonial friends here with regard to the various qualities of the wood, and the uses to which they can be applied. It would also be interesting if we could hear from Mr. Ransome what is the result of his observations and experiments upon these woods, and if he would state in what respect and to what extent he thinks they would be suited for practical use in England, or the colonies, as many of our profession are engaged in the carrying out of important engineering works in the colonies, to whom many of these woods, if they were thoroughly known, would be of use. I would therefore ask Mr. Ransome, in the first place, to favour us with some observations on the results of his experiments with these woods.

Mr. Ransome said:—I am very sorry that I cannot give you much information as to the most important point of all with regard to the woods you have seen operated upon:—viz., the price at which the various discriptions of timber can be delivered in London. There is no doubt that a great many of the woods which have been submitted are very fine indeed for a variety of purposes, and although our space was very cramped, you must all have seen enough to know that there are many woods of excellent quality, which would be of great use in this country. The question, however, is whether these woode can be imported into this country cheap enough to take the place of other woods now answering the purpose. As regards this, however, I think we may have the advantage of some information on the subject from the representatives of the different colonies present here to-day. It appears, perhaps, invidious to select certain woods, but at the same time we are here for practical purposes, and I think it only useful and right to mention that there are certain woods which we have tried (for we have been experimenting during the last fortnight upon them), which stand out as pre-eminently good woods. If you will allow me, I will just mention them, and then the representatives of the different colonies who follow me will, perhaps, give you some information as to the cost at which they can be imported.

The speaker then referred in turn to the principal woods to be found in New South Wales, Victoria, Western Australia. New Zealand, Canada, the Cape, India, &c.

Referring to Canada the speaker said:—From the Canadian Commission we received some excellent samples of woods, the Douglas fir and black ash demanding special notice. It is only quite recently that the district in which the Douglas fir is found in the greatest abundance has been opened up by the Pacific Railway, and I cannot help thinking that ere long it will be imported in large quantities into this country. It is a specially fine wood for joiners' work, runs to a very large size, is mild to work, and is suitable for the same purposes as yellow pine. We also find a matter which touches us nearly) that it is thoroughly well suited for engineers' patterns, and when soaked in water it swells considerably less than any other wood at present employed for that purpose. As regards black ash it is difficult to understand why it has not more largely found its way into this country, as it is cheap, and in all its qualities resembles very much the better known and popular American white ash. You have seen to-day this wood converted into casks, joiners' work, and spokes, for all of which purposes it is well adapted. The American hop-hornbeam is a very close grained wood which is largely used in Canada for making hammer handles and similar work, for which it appears to me to be well suited.

Professor Macoum (Canada) being called upon, said:—I will not detain the meeting very long, but after hearing the other gentlemen speak I feel there are one or two remarks that I should make in connection with Canadian woods. Before I speak of those immediately before us I would say that the reason you know so few of the Canadian woods is simply this, that we are English over there as much as you are here, and our prejudices are the same, and therefore it is hard for us to get out of the beaten track. We know that you will take certain woods, and we know how difficult it is to get you to take any others, and therefore we have not tried to introduce a great many of our woods, because it will be hard to bring them into the market. Many of our men say that the white pine, known as the yellow pine here, is getting scarce, but we think the Douglas pine, which is not confined to British Columbia, will take its place. It is found all through the Rocky and Selkirk mountains, right down to the Pacific Coast; and I know that it grows five degrees to the north, as I myself found it from latitude 49° to latitude 55°; so that you see the supply is not limited, and when our yellow pine gets so scarce that it becomes dear, you will have to take this in its place. The trees will produce a great quantity of timber, and one tree that was cut down was 90ft. long, the large end being just 13in. across, and the small 7in.; so that in 90ft. the taper was precisely 6in. Some gentlemen may say, I do not believe it; but it can be proved, as I myself saw it in the Selkirks last year. When I tell you the tree tapers so little, you naturally ask, what sort of a forest is it? and I would say, it is a forest of mighty trunks, and these little trees have to run away up to get a little of the fresh air of heaven. I mention this to show that what Mr. Ransome said about this wood is correct, and I would add that it is useful for all purposes. As regards our black ash, I am astonished at its not being in use. But what is the good of sending it when Englishmen believe the white ash better, although at the same time I have not the slightest hesitation in saying that some of the white ash that is sold here (you see the prejudice of the Englishmen), is nothing, more or less, than black ash. Mr. Ransome has shown you that black ash is useful for almost every purpose, and as to quantity, I have to say that all through Quebec and Northern Ontario our swamps are filled with this wood, where it is of no value but to make firewood or split into rails for our fences. And when I mention it is so plentiful it is for you who know what you give for elm and white ash to say whether it would answer your purpose to take it. This and the Douglas fir we could deliver on the English market for about £5 per ton. The day is coming when this black ash will be used almost exclusively, although until the last two years it was scarcely known to exist at all. When we Canadians talk about supplying wood, we are prepared to supply any quantity, not for a few years only but for years and years. I meet gentlemen who tell me, "We do not want Canadian pine, we want Archangel pine;" and I say, "God help you, that is not pine at all; it is spruce." (Laughter). We have spruce very nearly the same but better wood, that grows from the Atlantic to the Pacific. We have immense rivers that will float it down, and if the Hudson's Bay route is opened up, and some of the men who now carry grain were to carry northern pine, it would answer their purpose much better. We have this in such quantities that I can look for hundreds and thousands of miles and see nothing but vast trees; I can look from Halifax to Victoria and see nothing but great forests of pine. You need not go to other colonies and hunt for pine. There is the wood, and you can stain it to anything. You can make mahogany of it, if you like, or anything else nowadays. (Laughter). The hickory extends from Halifax to our Western port of Victoria, and our people do not use its because it is so plentiful. Here you see an axe handle made of it. Before I sit down I have one more word. As representing Canada, I say that we feel extremely grateful to Messrs. Ransome and Co. for the privilege of having our woods brought before you here. We have tried to bring them before you in the exhibition, but we could not do it, and I thank them for the privilege of showing it here. I see the value of the machinery. It is suitable for cutting up all our woods, and by its adoption, instead of having the woods simply squared for export, with the aid of the machinery we could cut them up in any way, and send them over here in any useful sizes that may be wanted.

After speeches from several other Colonial visitors, representing the countries above referred to, and the customery votes of thanks being tendered Sir Philip Cunliffe Owen said:—Before the meeting breaks up I have a request to make on behalf of His Royal Highness the Prince of Wales, and that is, that Mr. Ransome will favour the Royal Commission with a report of the proceedings during this day in order that it may embodied in the official report on the exhibition. I think it is perfectly worthy of being recorded in the report of the Royal Commission. We have heard so many interesting speeches, and so many interesting experiments have taken place, that I think it only right and fair to all parties that they should be recorded for the benefit of everybody and the developement of the trade. I therefore propose that Mr. Ransome will favour us with a report at his convenience.

Mr. Ransome was understood to acquiesce in this proposition.

The statement is made that all the varied machinery of Great Britain, now operated by steam power, is capable of performing more work, and hence producing more products, than could be produced by the labor of 400,000,000 able-bodied men, a greater number than all the able-bodied men on earth.

ANARCHISM AND THE LABOR MOVEMENT.

Hitherto the Labor Movement has been merely industrial; it is now becoming political, and combining with the other revolutionary elements in what threatens to develop into a general attack upon existing civilization. The motives of the leaders we understand; they may expect to gain by a reign of havoc; and what they mean by anarchy is a destruction of all existing authority, and the erection of their own despotism in its place. Like the French Jacobins, their precursors and their models, they would exercise in the name of liberty a tyranny more sanguinary and more grinding than ever was the tyranny of kings. But a prosperous and respectable workingman ought surely to think twice before he lends himself to an attempt to convulse and wreck society. He is not without the teaching of experience to guide him as to the probable results. In the French Revolution the Destructives had it all their own way; they did without restraint everything that the Anarchists and the fanatical enemies of Capital in the present day burn to do; they pillaged and butchered the rich to their hearts content, and broke up the whole framework of society. What followed? Universal misery and famine, after which natural laws prevailed, and society fell back into its old course, so that the Parisian workingman now, particularly if he drinks absinthe, is as discontented and querulous as ever. We are all members of a complex and graded civilization which, whatever its faults, cannot be torn to pieces without causing so much confusion and suffering that it may safely be said that there is no living man, the buccaneers who organize revolution alone excepted, who would not personally lose more than he would gain by the process. To take the calling most nearly connected with our own, what would a printer who is receiving good wages gain by throwing society into convulsions? Literature is one of the refinements rather than of the necessaries of life; it is taken most largely by the wealthy and highly educated; it is notoriously the first thing given up in times of distress it can hardly flourish except it quiet times. An anarchist or revolutionary printer may perhaps glory in the hope that printers a century hence will set their feet upon the necks of kings; but he will himself run no small risk of being deprived of bread.—*The Week, Toronto.*

TIMBER IN BRITAIN.

In nine months ending with September last, Great Britain received, through one hundred and twenty ports, no less than 2 638 808 loads of sawn and 1,219,125 of hewn timber, in all 3,857,938 loads, which was less than the imports of the same time in 1885 by 785,480 loads or sixteen per cent. The comparative quantities which entered the ports are given in an elaborate list, compiled by the *Timber Trades Journal* of October 23rd. From this we take the following figures of imports:

Port.	Loads. 9 mos., '86.	Loads. 9 mos., '85.
London	802,904	972 156
Liverpool	350,222	433 856
Hull	302,619	331 456
Cardiff	260,183	233,134
Grimsby	148 183	275,465
Hartlepool W	177,714	226,598
Newport	103 511	184,975
Grangeport	82 224	145,950
Newcastle	78,093	105,208
Bristol	69 589	100,578
Greenock	77,185	85,579
Leith	74,286	66,856
Dublin	54,530	65,793
Belfast	46,909	58,917
Glasgow	44,556	45,890

It will be observed the Leith is the only one, of all the ports named above, which received a greater quantity this year than last. Ayr, Aberdeen and Bo'ness are other Scotch ports of which the same may be said, but they are exceptions to the rule, which is that wood imports are reduced.

A SHIP ON FIRE.

The burning bark noticed off St. Pierre has been towed into that port and the crew safely landed on Langley's Island. The bark was found to be the Caspar, 806 tons, of Swansea, from Miramichi, October 29, for Liverpool, with a cargo of timber. Captain Roberts reports that everything went well until Sunday morning when fire was discovered under the forward house. There was a stiff breeze blowing at the time. The crew made strenuous but unavailing efforts to get the fire under control, but fanned by the increasing gale, the flames spread rapidly, while the heat and smoke were something terrible. At half past ten o'clock on Sunday night the crew, unable to stand it any longer, abandoned the ill-fated ship. At that hour the flames had burst through the forward house and blown up the forehatch. The crew of twelve men left her in the long boat and headed for Langley's Island, twenty-five miles distant, which they reached at eleven o'clock on Monday all well. Captain Roberts says it was a grand sight to see the ship all ablase on the ocean at night, with the flames fanned by the gale of wind. The sky and sea were illuminated for miles around. The tug Progress managed to get the burning hull in tow, and got into St. Pierre on November 9th. It had been burned to the water's edge, and was still burning inside below the water line. The crew give no explanation of the origin of the fire.

WANTED.

The publisher of the CANADA LUMBERMAN desires thoroughly reliable and competent correspondents at the fol owing named places :—

Kingston, Ontario.
Quebec City, Quebec.
St. John, New Brunswick.
Halifax, Nova Scotia.
Winnipeg, Manitoba.
Victoria, British Columbia.

The duty of each correspondent will be to give a review of his local market for the month preceding the date of issue, and the ruling quotations for different kinds of lumber, &c. For terms and any other information, address

A. G. MORTIMER,
Peterborough, Ont.

Market Reports.

TORONTO.

From Our Own Correspondent.

Our local market continues brisk, and although all kinds of bill lumber in pine is decidedly scarce; strange to say, prices do not advance. Holders, however, are firm on present figures, and before spring arrives prices must advance. One reason for pine bills not advancing may be found in the fact that hemlock is now being largely used for framing timber. There is fully treble the quantity of hemlock being used here as compared with even last season, and the total amount of all kinds consumed in this city this season will nearly double that of former yeare.

Shipments from our docks may now be said to be fairly closed. Two or three more cargoes may get off, that will be the outside quantity, and the bulk of the last month's shipments have been nearly green from the saw, in fact there is not any very large amount of dry lumber to come forward, although with the opening of navigation next spring, a considerable quantity will be available from the other side of the Georgian Bay. Figures for all grades of lumber remain about the same as during the earlier part of the season, No noticeable advance has taken place on any lines since the opening of the season.

The following are the ruling quotations in this city at present :—

Mill cull boards and scantling	$10 00
Shipping cull boards, promiscuous widths	12 00
" stocks	13 00
Scantling and joist, up to 16 ft	13 00
" " " 18 ft	14 00
" " " 20 ft	15 00
" " " 22 ft	16 00
" " " 24 ft	17 00
" " " 26 ft	18 00
" " " 28 ft	19 00
" " " 30 ft	20 00
" " " 32 ft	21 00
" " " 34 ft	22 50@22 50
" " " 36 ft	24 00
" " " 38 ft	27 00
" " " 40 to 44 ft	30 00
Cutting up planks to dry	20 00@25 00
" boards "	20 00
ound dressing stocks	16 00@18 00
Picks Am. inspection	30 00

Black ash 1 & 2	20 00@25 00

MONTREAL LUMBER MARKET.

From Our Own Correspondent.

MONTREAL, Nov. 25.—During the month of November, the lumber trade in Montreal has been of a very satisfactory nature, in fact there has been a continuance of the activity which, generally speaking, has characterized this line of business throughout the greater part of the year. Dealers here in looking over the transactions for this year to date, report an increase of nearly 50 per cent, over the corresponding portion of 1885, and there is an encouraging outlook for the winter trade, as there is yet quite a large amount of building under way. Some of our merchants here say that building operations have not been conducted on such an extensive scale for twelve years. Yard business continues brisk, there being a good local demand, but the bad roads usual at this time of the year, have militated somewhat agains country business, as farmers and others, have not been able to draw their supplies. The stocks in dealers' hands are fairly large for the season of the year; prices continue firm and unchanged, although there is nothing of a very special nature to excite the market.

Navigation being now closed, some idea of the export business from Montreal may be gleaned from the shipments by the Montreal Export Company to the River Plate during the season of 1886. Of the 29,088 204 feet of pine and spruce so shipped, 21 384 160 feet, all pine, was despatched from Montreal. The total pine so shipped was 21 782 604 feet, and spruce 7,305,060 feet. The detailed shipment is as follows :—

Shipments of lumber from the River St. Lawrence to the River Plate, during the season of 1886 :—

The Montreal *Witness* says :—About 100 lumbermen engaged here a fortnight ago have left to work for the winter in the lumber business at Port Arthur. No little difficulty was experienced in securing the right kind of men. Many refused twenty-four dollars per month and "all found"; and several who have signed the contract, and left their valises and watches with the employing agent, failed to put in an appearance. Good men were guaranteed from twenty-four to twenty-eight dollars per month, all found.

The following are the lumber quotations at the yards here :—

QUEBEC.

The timber market here has been quite lively of late, and several rafts of square and waney pine have changed hands. A slight advance in

at the rate of about 4,000 logs during the 24 hours, the result of which will be but comparatively few logs will remain over the winter unsawn.

It is reported a sale of pine deals has taken place in Ottawa, being produce of logs to be cut this winter. Prices not transpired, but understood to be about same as last years.

It is reported two lumber companies have been incorporated lately, namely :—The Ottawa Lumber Company with a capital stock of $150,000 in shares of $100 each, the incorporators being Messrs. Alexander Baptist, J. Dean, L. A. Dean, R. C. Blair and Alex. Houliston, of Three Rivers. They intend cutting lumber for United States market, and possibly a small quantity of deals for the English market.

Messrs. R. Reford, J. Dillon, of Montreal, D. W. Ross, of Cote St. Antoine, A. McLaudin, of East Templeton and W. Ross, of London, England; have been incorporated to carry on the lumber and manufacturing business under the name of The Charlemagne and Lake Ouarean Lumber Company, with a capital stock of $200,000 of $100 shares.

PHILADELPHIA.

There has been no perceptible falling off in this market since last report. Prices are still firm and a satisfactory condition of affairs exists all around. Yellow pine sells rapidly at good round figures, and the demand is greater than the imports. Sap pine is also in good demand, and a scarcity of this class of wood exists, which has tended to raise the price considerably. White pine is rather inactive, while a large trade is being done in yellow pine. Hemlock is in good demand, and is selling at about the usual figure. Spruce is in moderate supply, but prices are somewhat irregular, some dealers asking a slight advance. Interior finishers are running more into hardwoods; and the poorer grades of walnut are wanted, and the whole hardwood market shows strength and life.

SAGINAW VALLEY.

The *Lumberman's Gazette* of Bay City, in its issue of the 25th November, says:—The lumber business, so far as manufacturing and water shipments may be announced as practically closed and the few mills still running will cease operations in a few days at the farthest.

The mill owners who have timber of their own are busily engaged in the preparatory work of securing their supply of logs for next season's operations—some of them indeed being already at work in the pineries, and having a considerable quantity of logs on the skids. It may be stated in this connection also, that it is a fair presumption that the stock of logs for the Saginaw river mills will show a slight diminution at least, as compared with former years; but probably not so great as the prediction of some of the more skeptical would seem to indicate. It is a fact, however, which cannot be ignored that the lumbering business in the greatest manufacturing centre in the world in the past; is gradually but certainly concentrating into fewer hands, and that those men who have shrewdly made as extensive provision as possible in the past, for the demands of the future, by investing heavily in pine stumpage, are destined to reap rich rewards and abundant returns for their foresight and sagacity; and that mills with no pine timber possessions back of them, must gradually but surely succumb to the inevitable, and submit to removal; or suffer loss in their continued attempted operation with nothing but a precarious sawhill for maintenance, while their locations must be occupied by other and permanent industries, or suffer depreciation in value. Indeed the past season has been one of financial misfortune to several mills for the reasons stated, hereabouts as well as elsewhere, and failures and assignments have resulted.

The past season however, may be set down as financially successful for manufacturers in fact, who have been marketing their own timber. Prices have ruled satisfactorily high, and profits have been exceedingly gratifying, as they must inevitably be in the future in the absence of any unforseen financial crisis, business depression or extensive labor troubles.

When opening a correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

ADVERTISEMENTS

Those wishing to **BUY** or **SELL TIMBER LANDS, LUMBER** or **SECOND HAND MACHINERY** will find THE CANADIAN LUMBERMAN an excellent medium in which to make known their wants. Advertisements of this character will be inserted at the low rate of **1 CENT A WORD**, cash to accompany the order in every case. Address.

Peterborough, Ont.

CHICAGO.

The *Northwestern Lumberman* says:—The prospect is that shipment from the mills will cease this year earlier than usual. On the great lakes freight rates are so high that it is preferable to let lumber remain on dock until next spring. On Saginaw river heavy purchases are being made of lumber that will not be shipped until next season. In the Chicago district the late drop in the price of short dimension, combined with high freight rates, has tended to discourage the mill men about shipping much more lumber this fall. From east shore points comes reports of a general determination to forward but little product to market this season but to pile the cut of the mills till they are shut down. The opinion appears to prevail among the manufactures that lumber is a good enough property to hold until conditions of sale are more favorable than now.

On the other hand, the merchants have reached the conclusion that they will offer no inducements to prolong the stocking up season. The trade does not regard the situation so good, or the prospect so bright, that it can afford to offer higher prices as an inducement for bringing forward the green lumber that the saws are turning out.

Thus it will be seen that the business of the country is in a rather peculiar position. It is far from the boom that characterized it in the fall of 1881, for then it seemed as if the jobbers could not buy enough to satisfy them. Now there is a degree of indifference about making purchases, unless the terms are satisfactory. The reason for this is not because the distributive demand has not been fairly satisfactory this season, but because prices still hang at a level not much above those that prevailed a year ago. In this market if it were not for the fact that long dimension is worth this year relatively more than it was last at a corresponding date, there would have been no gain in the value of Lake Michigan product. Short dimension is worth in this market no more to-day than it was last year at a like time, while the supply at the mills seems to be accumulating. Stocks in the yards are probably less than they were at this date last year and in the matter of dimension, they are more broken and equally sorted.

There is no burdensome surplus of lumber in the yards, but there has been no such cleaning off of mill stocks as has been predicted. But the supply of logs has been closer sawed up this season than last. The lumber business in the lake region, and in fact in all the white pine districts, is simply in a state of good health, but it is neither flashy nor robust. All have been counting on a boom during the year that has not come, and all are looking up expectantly, like young robins, with their mouth open, for the cherries of profit to drop into them. The fruit would fall in the right place if a little increased stimulus could be given to the demand. That stimulus would be given by a rise in the prices of farm products. Until there be such a rise, it is idle to expect a marked increase in the demand for lumber, or a material advance in its selling value.

At the yards business was not quite so active as has attained during the past month but there was a steady movement all the time. The out-of-town demand is quite heavy. Collections continue rather poor and some difficulty is experienced in that way. The Southwestern railroad freight cut has not come in to assist this market by opening Kansas City as better depot for sales. The demand between yards is good as sorting continues with unabated fury:—

NEW YORK CITY.

Reports from this city show that as a rule the lumber trade has been moderately brisk during the past month. The demand for all descriptions has been quite active and the volume of business has been fully up to that of the past few months. The demand from the yards is unusually brisk, owing, principally, to the large amount of building at present going on. This state of affairs in the yards is likely to exist for a few months at least. The export movement, while in some respects showing a slight decrease, keeps up very well, and the business completed, is, on a whole, encouraging. The market for yellow pine and spruce has ruled very firm. In white pine very little change has occurred. Trade all around has been quite active, and a cheerful feeling characterizes the market generally.

LONDON, ENG.

LONDON, NOV. 20.—There is not much of interest to note since our last, and it appears now to be generally felt that as regards the position here there is not likely to be any change from the present quietude before the advent of the new year. By that time we shall be able to judge more correctly as to the stocks here and the prospects of consumption in the future.

The chief point of interest is now shifting from this country to the other side, and is being centred on the probable free-on-board quotations for next season, and the extent of business that is likely to be transacted. The question is rather a complex one, the chief factor in arriving at a conclusion necessarily depending mainly on the views taken as to the future prospects of general trade both in this country and abroad. Of one thing we may be tolerably certain, and that is that the consumption of wood goods here and in the Colonies is, to say the least, not likely to be less than for the present year. Prices are now at a low level, and stocks generally throughout the country are in moderate compass, so that, should the present improving tendency in general trade continue and develop further, we may in the spring have larger demand for first open water shipments than has been experienced for several years. Should this be the case, we think producers would act wisely in not making quotations too high, but rather study to keep prices at a moderate level, and thus ensure a steady and continuous volume of business throughout the season to the mutual advantage of both seller and buyer. A constantly fluctuating market renders buyers timid and cautious, while an even and regular range of prices emboldens them to purchase freely for their probable requirements.

Each week that passes continues to confirm the views we expressed some time ago as to the unsoundness of trade in several quarters, and we are afraid we have not yet seen the end of it. It is, however, reasonable to hope that in the long run the trade must be improved and strengthened by the elimination of what weakness and unsoundness exists.—*London Timber.*

LIVERPOOL.

LIVERPOOL, Nov. 20.—The timber trade of Liverpool has been more or less excited by the announcement that one or two more failures are to follow those already published; however, as the result of this has to a great extent been anticipated, and comparatively few houses are involved to a large amount, the trade is really not much affected except in a certain circle. In spite of these adverse circumstances, it is thought that although there is not a great volume of business doing, there is a better tone prevailing and orders recently taken have been at more remunerative prices. The arrivals are only light.

BOARD OF TRADE RETURNS LONDON, ENGLAND.

MONTREAL, QUE.

WHAT THEY SAY OF US.

The CANADA LUMBERMAN, published every month by Mr. A. G. Mortimer, Peterborough, is one of those practical periodicals, which are invaluable to the members of the constituency to which they cater.—*Orillia Packet.*

THE CANADA LUMBERMAN is still published monthly by Mr. A. G. Mortimer, of Peterborough, and is devoted to the lumber and wood-working industries of the Dominion. It is a valuable technical journal.—*London Free Press.*

THE first issue of the CANADA LUMBERMAN under its new management clearly indicates that Mr. Mortimer has not missed his calling, and that the Dominion is going to have a newsy exponent of the lumber trade. Success to it.—*Chicago Lumber Trades Journal.*

MR. A. G. MORTIMER, who has for many years been connected with the *Mechanical and Milling News*, has assumed the proprietorship of the CANADA LUMBERMAN, which will hereafter be issued on the first day of every month.—*Deseronto Tribune.*

THE CANADA LUMBERMAN published at Peterborough is now under the editorial and business management of Mr. A. G. Mortimer. The LUMBERMAN is a good trade journal, and should meet with success.—*Bobcaygeon Independent.*

THE CANADA LUMBERMAN published at Peterborough, Ont., has been sold by the Peterborough Review Printing and Publishing Company, Limited, to A. G. Mortimer. The paper has been published semi-monthly, at $2 a year, but now it will be made into a monthly, the subscription price being placed at $1.—*N W. Lumberman.*

THE CANADA LUMBERMAN has been purchased by Mr. A. G. Mortimer, an old office mate of the editor of the *Star*, who has changed the paper to a monthly, and has reduced the subscription price to $1 per year. We wish him every success in his new undertaking.—*Parry Sound Star.*

THE October number of the CANADA LUMBERMAN is undoubtedly the best copy of that journal which we have yet received. Every person interested in the lumber industry of Canada or the preservation of our forests should subscribe for the LUMBERMAN.—*Deseronto Tribune.*

THE CANADA LUMBERMAN, hitherto published by the Peterborough Review Printing Co., will hereafter be published by Mr. A. G. Mortimer, of the *Mechanical and Milling News*, on the 1st of every month, at $1 a year. The LUMBERMAN will now be in good hands.—*Uxbridge Guardian.*

Mr. A. G. Mortimer has assumed editorial and business management of the CANADA LUMBERMAN, which is published monthly at Peterborough. The October number we found to be full of matter interesting to the trade, well and clearly arranged.—*Canadian Manufacturer.*

THE CANADA LUMBERMAN, published in Peterborough, we are pleased to notice, continues to flourish. Is the only journal in the Dominion devoted to the lumber and wood-working industries, and should find a ready patronage from wood-workers and those connected with the lumber interest.—*Port Hope Times.*

A. G. MORTIMER, brother of the publisher of the *Dominion Mechanical and Milling News*, has purchased the CANADA LUMBERMAN from the Review Printing and Publishing Co., of Peterborough, Ont., and will hereafter conduct it as a monthly journal. The subscription price, which, as a semi-monthly, was $2 per annum, has been reduced to $1. Under its new management we hope to see the LUMBERMAN live and prosper.—*Dominion M. and M. News.*

OUR Canadian cotemporary, the CANADA LUMBERMAN, published at Peterborough, Ont., has been purchased by Mr. A. G. Mortimer. Under the new management the LUMBERMAN will be issued on the first of each month, and the subscription price will be $1 a year. Mr. Mortimer has made himself known in Canada by his connection with the Toronto *Mechanical and Milling News*, and his experience in trade journalism will enable him to keep the LUMBERMAN at a high standard of excellence as a news journal and an advertising medium.—*Lumber World, Buffalo, N.Y.*

THE CANADA LUMBERMAN now in its seventh year, has passed under the editorial control and business management of Mr. A. G. Mortimer, who has had considerable experience in the management of trade journals. The LUMBERMAN contains several special features of much value to those engaged in the lumbering business and promises, by its trade reports and attention to the interests which it represents, to be an indispensable periodical.—*Ottawa Journal.*

We are pleased to notice that under its new management the CANADA LUMBERMAN is being enlarged and improved in many ways. Mr. Mortimer seems to have the correct idea of how to conduct a trade publication, and one of his first improvements has been the addition of an attractive cover to be followed by the adoption of a fine toned paper throughout. We wish our successor every success that his enterprise merits.—*Peterborough Review.*

CANADA LUMBERMAN.—This excellent journal has been purchased by Mr, A. G. Mortimer, and will hereafter be published monthly at the low price of $1 per annum. The CANADA LUMBERMAN is the only newspaper devoted to the lumber and woodworking industries of the Dominion, and should be taken by every person interested in the manufacture and sale of lumber.—*Midland Free Press,*

Under the editorial management of Mr. A.G. Mortimer, by whom it was recently purchased, THE CANADA LUMBERMAN has greatly improved. Its handsome typographical appearance, and its varied and interesting list of contents, are eminently in keeping with the evidently progressive ideas of its present owner. It is deserving of a wide circulation among the lumbermen of the Dominion. Published monthly at Peterborough, Ont.; subscription, $1. — *The Timberman, Chicago.*

THE CANADA LUMBERMAN, published monthly by Mr. A. G. Mortimer, at Peterborough, Ont., is one of the best trade journals in the Dominion. As its name denotes, it is devoted chiefly to the discussion of matters affecting the lumber trade of Canada, in all its branches, from getting the logs out of the forest till they are ready to be put on the market in various manufactured states. It is a large 16 page journal, now in its sixth volume, and has so far deserved success that its publishers have decided on introducing several improvements in its make-up, commencing with the next number.—*Montreal Gazette.*

RAILWAY NOTES.

The C. P. R. company will have an entrance into Boston before May 1st, 1887.

The Saskatchewan and Western Railway has been completed to Rapid City.

IT is rumored that the Canadian Pacific has secured an outlet to New York by securing some New England roads.

It is expected the C.P.R. will enter the city of Hamilton by short span from the Toronto and Niagara falls line.

A collision occurred on the C. P. R. at Roger's Pass, B.C., on Saturday night. Two passengers are known to fatally have been injured.

Workman are busily engaged in completing the new (or lower) line of railway to the Vancouver Coal Company's South Field Mine. The mine will be reopened as soon as the railway is finished.

The C. P. R. Co. having completed the railway bridge over False Creek without a draw, steps are being taken to appeal to the federal authorities against closing this waterway against navigation.

W. A. Peterson, Canadian Pacific railway engineer, has gone to Sault Ste. Marie to make preliminary surveys for the proposed bridge at that place to connect the Algoma branch of the C.P.R. with the Chicago Minneapolis and Manitoba railway.

The jubilee of railways will be celebrated in Paris next year. On this occasion there will be held—first, an international exhibition of railways and of industries connected with them, which will be open from May to October, 1887; secondly, an international congress composed of delegates of railway companies, Chambers of Commerce, Syndical Chambers of Trades, scientific societies and others.

The C. P. R. company is extending its telegraph system from Medicine Hat to Fort Benton in Montana.

THE Canadian Pacific Railway are abolishing the present eating houses at Calgary and Broadview, and will run a dining car instead over this section of the road. The dining car will be taken off the eastern end of the road through the Rocky Mountains and the new hotel at Field made a dining station.

The engineers who have been locating the Saskatchewan and Western Railway westward to the Assiniboine river, about fifty miles from the present terminus at Rapid City, are finished. They will go on locating the extention of the M. & N. W. Railway another fifty miles toward Prince Albert.

Application has been made to Parliament for to an Act incorporate the Teeswater and Inverhuron Railway Company to build a line of railway from Teeswater via Tiverton to Inverhuron, and to take over and manage the harbor with the consent of the Governmet and the municipalities interested.

The short line of railroad from Smith's Falls to Montreal is well advanced towards completion. Trains are running from Smith's Falls to Merrickville, and from Bell's Corners to Kemptville. The St. Anne's, Oxford Mills and Kemptville bridges are nearing completion, by which straight connections with Montreal will be made.

The Canada Atlantic Railway company have made arrangements for the hire of 500 American cars to be used in the transport of foreign grain from Chicago to Owen Sound, and then to Boston via Ottawa and the Canada Atlantic railway. This is eighty miles shorter than any. The first shipment passed through Ottawa a couple of weeks ago.

THE Canadian Pacific representatives have submitted the details of their new route into Toronto. The rails will be laid on the west bank of the river, which position will be reached by a branch from the Ontario & Quebec main line, some distance east of the ravine bridge. The Don will be crossed at that point by an iron bridge. The right of way will be purchased from this point to a point half way between King street and Eastern avenue. Here the line will deflect by a curve westward until Berkeley street is reached. From this point the company propose to reach their projected staton at the foot of Bay street by means of a road to be filled in south of the present breastworks. These plans will be worked out concurrently with the improvement of the Don.

THE time made on the Canadian Pacific railway from Montreal to Vancouver, a distance of 2900 miles is 136 hours. This will soon be reduced to 120 hours, while specials may make the distance in 90 hours. When the short line is completed next autumn, through trains will make the trip from Halifax to Vancouver, a distance of 3590 miles, in 116 hours. Passengers will then be able to make the trip from London to Vancouver in 240 hours or ten days. The time from Vancouver to Yokohama by the proposed Pacific line of steamers will be 12 days, from Vancouver, to Hong Kong 17 days. The time from Halifax to Hong Kong will be 21½ days; and the trip from Halifax around the world to Halifax may be made in 61 days, thus breaking Jules Verne's record by 19 days.

THE Thunder Bay railway, now in course of construction will develop the mineral district tributary to the head of Lake Superior, and feeding the Canadian Pacific Railway. To any one familar with the great richness of the silver deposits alone, it is a wonder that the road was not built before. Dr. Lehman of St. Paul, the well known mining expert, says this is superior to the great Montana silver district, and in a few years must have a vast output. In fact he considers it the greatest silver bearing region in the world. The line will also tap the fine agricultural lands and valley bottoms, and will afford a means of marketing the millions of pine and other timber along its proposed and surveyed course. The engineers report a good route, with construction easy, and cost reasonable.

When opening a correspondence wtih advertisers always mention that you saw their advertisement in the "Canada Lumberman."

A SHORT, SIMPLE RULE FOR MEASURING STRAIGHT LOGS.

An experienced log and lumber inspector gives the following short and easily remembered rule for ascertaining the contents of a log by Doyle's rule when a copy of Scribner's book is not available:

RULE.—Square the diameter of the log after subtracting 4inches from it, and the result will be the exact contents in inch boards of a log 16 feet long. A log 8 feet long will be half this amount; 12 feet long three-quarters, 14 feet long seven-eights, and so on.

He also states that there is but one accurate rule for measuring crooked, hollow and knotty logs, and gives it thus:

RULE.—Have the log cut into the kind of lumber wanted on a good mill, by a competent sawyer, and have it inspected and measured by the Nashville inspection rules.

When opening correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh. Out of 2,000 patients treated during the past six months, fully ninety per cent, have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is pratically cured, and the permanency is unquestioned, as cures effected by him four years ago cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.*

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.

General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.
MANAGER—WILLIAM SMITH.

General Offices—Court St., Toronto, Ont.

Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts, and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from mi-representations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast table with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*"Civil Service Gazette."*

Made simply with boiling water or milk. Sold only in packets by Grocers, labelled thus:

London, England

Notice to Contractors.

TENDERS will be invited for the construction of the Section of the Cape Breton Railway extending from the Grand Narrows to Sidney, a distance of about 45 miles. This preliminary notice is given in order that Contractors desiring to tender for the work may have an opportunitp to examine the location before the winter sets in.

By order,

A. P. BRADLEY,

Dep. of Railways and Canals,
Ottawa, 26th Nov., 1886.

Wrought Iron Shanty Cook Stoves

The Best Article ever offered to the Trade.

I have much pleasure in drawing attention to my **WROUGHT IRON COOKING STOVE**, for Shanty, Hotel and Boarding House use. These Stoves are made of Heavy Sheet Iron, the top and lining of the fire-box being of Heavy Cast Metal and all the connecting parts of substantial Wrought Iron Work. The dimensions of these Stoves are as follows:

Top surface contains six 10-inch holes, fire box 28 inches long, and one oven 19x34x23.

The Best Stove I have ever Used.

PETERBOROUGH, May 31, 1880.

ADAM HALL, Esq., Peterborough. Dear Sir,—I have used your Wrought Iron Cooking Stove in our lumbering operations since its introduction here, and have no hesitation in saying that I prefer it to any other. For durability, economy and efficiency, where a large number of men are employed, it is the best stove I have ever used. You can, with confidence, offer it to hotels, boarding houses and lumbermen.

Yours truly, THOS. GEO. HAZLITT.

The Stove for Lumbermen.

PETERBOROUGH, June 3rd, 1880.

ADAM HALL, Esq., Peterborough. My Dear Sir,—We have used your Wrought Iron Cooking Stove and find it is very satisfactory for lumber operations, especially so on drives. We can recommend it highly.

Yours truly, J. M. IRWIN.

Gives the Greatest Satisfaction.

PETERBOROUGH, June 3rd, 1880.

A. HALL, Peterborough. Dear Sir,—I have had the Wrought Iron Cooking Stove, purchased from you, in constant use ever since last fall, and it gives the greatest satisfaction in every respect. I can recommend them highly to any one who is in the lumber business. Very truly yours, GEO. HILLIARD, M. P.

Gutta Percha & Rubber Mfg. Co'y

T. McILROY, Jr., Manager,

MAIN OFFICES and WAREHOUSE at the Factories, 135 to 155 West Lodge Avenue, P. O. Box 494. **TORONTO**

The largest Manufacturers in the world of Vulcanized India Rubber Goods for mechanical purposes.

Rubber Belting from ONE to SEVENTY-TWO inches wide. ***Hose,*** for conducting, suction and steam. ***Packing,*** Cloth Insertion and pure ***Tubing*** of all kinds. ***Rubber, Linen and Cotton Fire Hose. Leather Belting,*** Extra heavy American Oak Tanned.

A Full Stock always on hand. Write for Price Lists and Discounts.

Works also at NEW YORK and SAN FRANCISCO.

THE TANITE COMPANY

STROUDSBURG,

MONROE COUNTY, PENNSYLVANIA, U. S.

MANUFACTURERS OF

Solid EMERY WHEELS

AND SHARPENING MACHINERY.

The products of the Manufacture of the Tanite Company have, for almost 18 years' enjoyed a great reputation, and have been recognized for a long while, in all the countries of the world as a type of excellence in this class of work. In order to increase in Canada their already widely extended use, the Co'y has recently added to the liberality of its terms and conditions, and has chosen the following Houses, so extensively known, to be its Agents:

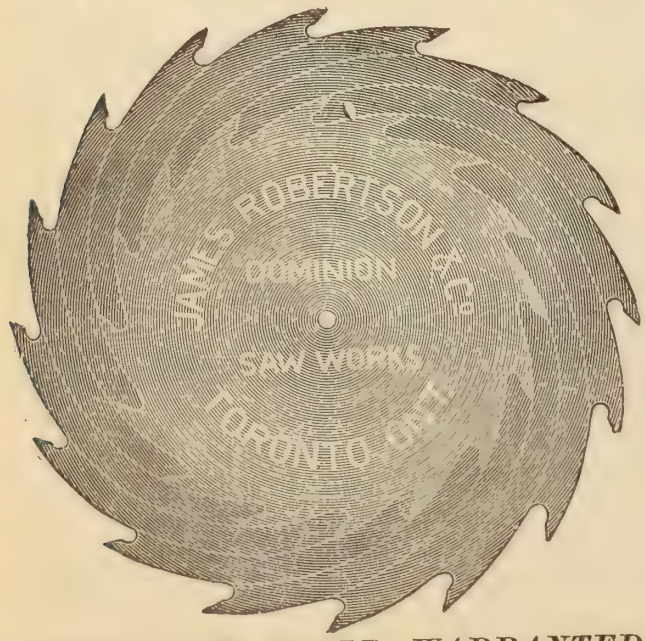
BEAUDET & CHINIC } QUEBEC.
F. H. ANDREWS & SON } TORONTO.
A. R. WILLIAMS, . . .

MONTREAL SAW WORKS . . . . .
MACHINERY SUPPLY ASSOCIATION } MONTREAL
R. H. BUCHANAN & CO. . . . .

Dominion Saw Works!

JAMES ROBERTSON & CO.

253 to 267 KING ST. EAST, TORONTO, ONT.



EVERY SAW FULLY WARRANTED.
Prices on Application.

MANUFACTURERS OF SAWS

Circular, Shingle, Gang, Cross Cut,
Concave, Mulay, Drag, Grooving.

THURBERS ROYAL

Anti-Friction Babbit Metal

IMPORTERS AND DEALERS IN

Band Saws, Emery Wheels, Files,
Saw Swages, Rubber Belting, Saw Sets,
Saw Gummers, Leather Belting, Iron Pipe, &c.

VOL. 7. PETERBOROUGH, ONT., JANUARY, 1887. NO. 1.

PLANING MILL PRACTICE.

WHAT do we do, or what can we do, to make all of our planed stuff of uniform thickness? Every man for himself and every mill for itself seems to be the motto and way of doing business, each having a style and thickness of its own, and each varying a little. Some have a way of making their work just a little large, and anything that does not plane up at that goes one-eight of an inch thinner. Another mill has a way of making its stuff a little thin, which picks up all these thin boards and everything goes into what they call a standard thickness. That is the standard for that mill. But, to be more particular, what do these individual mills do to make their own stuff of their standard, uniform thickness? Every man, when he first starts up, takes up his rule and tries one edge and then the other, to see if both sides are alike, and if one edge is a little thicker than the other, he stops, and if he is running two sides he raises or lowers the pressure bars till he gets it right, and then proceeds. But just as likely as not when he measured the first time his rule, instead of being straight across, was held at an angle of several degrees, and the board was really thinner than he thought it was, and when he comes to measure again the fault is corrected, and now he finds it wrong because he was wrong himself the first time he measured it, and the adjustment has to be all overhauled again. Finally it goes right, or, at any rate, it goes to suit him, and he goes on with his work.

Many persons carry one of these little caliper rules in their pockets, which is well enough in itself, but generally they have been carried so long that the figures are all worn out and they have to rub the bar in their hair to draw out the figures, the same as I have seen people rub the old four pences and six-pences to show the bar on them.

The way of measuring stuff to see that it is of the right thickness when we first start up is the correct way, but the way rules are often used is anything but what it ought to be, and a great many times makes the stuff anything but of a uniform thickness.

If we should take a solid gauge for thickness and slip it on to the edge of the board we should find that our rule measurements were very far from being a perfect thing.

If any person will take the pains to measure the stuff he is planing with a rule, and be as exact as he can, and then take solid gauge made of some kind of hard wood or metal, and he will see that the ordinary measure by a rule is quite a ways from being perfect, and yet we are surprised to see that boards will show quite a difference when measured by a solid gauge, and when they are piled up the pile will stand square.

We all (or most all) of us watch the pile as it grows higher and higher, when it goes away from the mill, and if it piles up square we "rest the case" and are satisfied that the mill is running right. But, as I have said, if we take this same pile and slip a solid gauge over each edge we shall more than as likely as not find that it will show it to be quite a ways from both edges being alike.

Now, while I shall argue that all stuff, wherever planed, should be of one thickness, i. e., that ½ inch should be just ½ inch everywhere, and ¾ should be just that anywhere we may find it, or 1⅛ should all be that, no matter who planes it or where it comes from. If we are to have 15 16 let it all be of a uniform thickness, and not be 1-32 scant or full, as the case may be, according to the mill it may come from.

Well, how are we to get at this uniformity? We all know that under the present conditions it is next to impossible to do it. We might as well try to bring order out of chaos as to attempt any such thing under the now existing circumstances, when everybody "paddles his own canoe."

Lumber conventions get together and talk up matters of interest in their business were dollars and cents are concerned, but I never have seen or heard of their talking up anything of this kind, notwithstanding I do think this and some other like things would be matters of interest to talk up when planing mill men have their big talks.

As an operator, I can see why it is next to impossible for every board in a lot (unless it should be a small lot) to be of the same thickness. You see, a man starts out on a lot, say 10,000 feet of boards, and he runs along till his knives get dull, and all the while his stuff is varying in thickness a little. The rule hardly shows it, but if a solid gauge is slipped over the edge it will show very plainly there is a decided change in thickness. Well, he runs till he thinks it best to sharpen his knives, and after sharpening starts up to run the rest of the lot. Perhaps he dont even try the thickness by rule, but if he did, the difference was so small he didn't think it worth noticing, and works on till the lot is finished. Now the "almost impossible" comes in in the present arrangement of the parts of the planing machine. If the operator wants to alter just a least bit, he must let his board run out and come up with the tightening nuts and turn down perhaps half a turn and then turn up again till he guesses he is about right, and starts up. Maybe he is right and maybe not. If not, he tries it again, perhaps this time guessing. We have to come down to the fact that all these little alterations are little, if any, better than guess work.

A great many planers have a gauge to set them by when we are about to make any considerable alteration, but when we come to alter just a little or, as we nearly all say, "just a hair," then a gauge does not amount to anything, and we have to guess that we have lowered or raised the head about enough. We should have to do all of this even if we had the most perfect apparatus in the world for measuring the thickness of stuff, but if we had better gauges for making these measurements and paid strict attention to their use, I think planed stuff would be much more uniform in thickness. When nothing better is to be had, if we take a good, hard piece of oak and cut into it across the grain about two inches deep, just the thickness you want the stuff, you will have something that will last a great while and be very accurate. But the hardest of oak wears away finally, and gradually the standard becomes thicker, until we have to make a new oak gauge and reduce thickness to just the point we want it.

A wooden gauge is always more or less faulty, because in damp weather it absorbs moisture to that extent that it becomes perceptibly larger. I thought one time that I would have a perfect gauge to work two sides with tongue and groove in the centre, so I took a piece of hard maple and planed to pieces 5-16 and another ¼ inch, and putting the ¼ inch in the centre in a way to form a tongue and groove, I glued the three parts together solid. I did have a nice one and as perfect as a wooden gauge could be, but I found by using a solid iron gauge for thickness that wet weather would make it quite a little large. By using the two together I could, by watching out, make stuff very nearly all alike.

I have in my mind a gauge which, I think, would give good satisfaction to all parties concerned.

A bar of steel, ⅜ by 1 inch and about 6 inches long, ground and polished and marked like a rule thirty seconds on one side and tenths and twelfths on the other. On one end of this bar should be a solid flat head, having considerable surface and projecting 1¾ or 2 inches. On the bar should be a sliding head just as large as the solid one, and fastened firmly with a set screw. The movable head could be set to any point and would always be reliable if the scale on the bar was right, the thickness would be correct, and the tool could be used as long as any ordinary man would want to work in a planing mill.

If it went through the suction fan several times or got into the furnaces a couple of times, where wrenches and lots of other tools frequently find a stopping place, it would become very much demoralized. If such a tool were in common use, as it ought to be, another ought to be bought for about $1.50, which is the price such a thing ought to be made to retail for. We ought to have this for this work only, and not make it, as many other tools are made, with forty or fifty things attached to it. Say a saw set and glass cutter and can opener, a hammer and screw driver and gimlet twister and socket wrench. Tools work best that are made for and used for a special purpose and not for anything else. We think sometimes it is a gain to use a monkey wrench for a hammer, but if we do we very soon have neither wrench nor hammer to use, and have to beg, borrow, or buy both a wrench and hammer.

Now, I don't think a solid gauge to slip on to the edge of the board would cure all the ills that planing humanity is heir to or make every board from Maine to California of exactly the same thickness, yet I do think if they used to a greater extent then they are, and a certain amount of heedlessness was taken out of some men handling our planing machines by by some kind of patented process, there would be very much less grumbling among those who make the door and window frames and casings and every piece of work where boards are brought together and show their varying thickness, and have to be trimmed with plane and chisel in consequence.—J. T. Langdon, in the *Builder and Wood-Worker*.

AN AMERICAN OPINION OF CANADA AND ITS RESOURCES.

The following is taken from the Missis-ippi Valley *Lumberman and Manufacturer*, and is an instance of the feeling existing across the border, regarding the agricultural timber and mineral resources of Canada:

Last week we had occasion to notice the commencement of the construction of the Winnipeg & Hudson Bay railway, and alluded to the misapprehension which exists in reference to the great region known as British America, stretching in a broad belt from the Atlantic to the Pacific and all north of the Northern boundary of the United States to the Artic regions. This has been a *terraincognita* to all the world except the Hudson Bay Fur Company, who carefully concealed its wonders from the public gaze for a century. A thin border of settlements stretched themselves out the length of the St. Lawrence River, and pushed their way west along the Southern British border until they have reached the Pacific coast. This belt of, say 100 miles wide and 3,000 miles long, has been demonstrated to be not only a habitable country, but one capable of sustaining as dense a population as the same belt across Europe and Asia does now. A quarter of a century ago a large part of this belt was reported to be an arid waste, so bleak and desolate that only furred animals and Esquimaux could inhabit it. Now Manitoba, Assiniboine and Saskatchewan are conceded to be the best rivals if not superiors to Dakota and Montana as wheat producing countries. Vas

mineral deposits are being developed, and forests compared with which all the primeval timber of the United States was but a little grove, are now known to extend in an unbroken broad belt from the upper Peace and Saskatchewan country south and east across the Nelson River and Northern Lake Winnipeg country, away over the Spanish River and the vast Ottawa region, and eastward way down to the mouth of the Sanguina River and southern Labrador and the Atlantic coast. The vast and almost inexhaustible supply of timber would supply the two continents longer than the forest of Norway, Sweden and Russia have lasted Europe. These forests' the races who anteceded the Romans commenced to hew down, and they are still the great source of European supply. What these great Northern woods of Europe are to that continent British America will one day be to this. What the possibilities of development in British America are cannot now be surmised, but enough is known to warrant the belief that it can feed the world. The bulk of the population of the United States inhabit the belt made by 36° on the south 48° on the north. The next 12° of latitude on our north and hundreds of miles longer than ours is capable of sustaining fully as great a population. Its natural location and facilites for reaching the old world markets are far better than ours and under the fostering care and aided by the enormous wealth of the mother country, its development may be far more rapid than even is the marvelous progress made on our own side of the line. The sudden construction of the great transcontinental traffic line, the Canadian Pacific Railway, has in five years fully inaugurated an era of progress scarcely paralleled in the world's history. We have not the figures at hand to give the population and wealth which has seemingly sprung into existence in the Northwest Provinces, but it is amazing. The second step in the grand drama is the construction of the Hudson Bay & Winnipeg Road. These two lines with the lateral feeders which will speedily follow, are the certain means by which England intends to create a new Indian empire out of which to fill her coffers in ages to come. This great political movement on the part of our greatest rival has a significance to us beyond anything which has occurred in American history, save the Revolution and the Civil war. There is no question but that the British American Provinces can be made to produce a superabundance of almost every commodity now produced in or exported from, the double tier of Northern States. Breadstuffs, meats, wool, lumber, etc., which form the bulk of Northern States export, are already produced in them in such considerable quantities as to seriously effect our value at home and abroad. These provinces promise soon to supply the European demand and under their free trade privilege (which means maternal protection), cheap living, cheap labor system, with their more economical methods of life, can and do, produce all the staple commodities cheaper than we can, or do.

Another important factor is the great matter of transportation. With our long rail routes so crooked and circuitous that we have to go two thousand miles out of our road to reach European markets, and these routes in the hands of the most heartless and soulless corporations which ever effected a nation, who render fair competition with our northern neighbors an impossibility by their systems of extortion and robbery. These considerations render it extremely doubtful if it will be possible, at the end of another decade, for the wheat raisers and stock producers of the Northwestern States to earn a bare living. There must be a radical change or Asiatic and British American competition will destroy the great industries of Michigan, Wisconsin, Minnesota and Dakota.

RAMBLER'S NOTES.

A Visit to Some of the Lumber Firms of the Queen City and Elsewhere.

RAMBLER rises to wish all the readers of the LUMBERMAN the compliments of the season, and while doing so desires to intimate that he expects, health and weather permitting, to be present in this column once a month to tell what he has seen and heard concerning the trade and those who are engaged therein. If anyone asks you who Rambler is and where he comes from, be sure and tell him you don't know. This is by far the easiest way to tell the truth, and no one will be hurt. We have been wandering around Toronto for the past few days, and picked up quite a few notes. We have visited some of the larger firms and some of the smaller ones interested in the lumber business, and have left many others for a future occasion. When we get through with the Queen City in all probability we will turn up some place else when least expected. All that it is necessary for the members of the fraternity to do is to give us plenty of room to talk and ask questions. If they don't do this we will shake the dust from our feet and leave by the first train. There is more dry facts and lengthy figures in lumber lore than is to be found in almost anything else, but you get used to it in time and don't mind it. Why it is a common occurrence to find a lumberman with a whole year's quotations laid away in his upper storey, ready for any emergency. Ask him how the market ruled six months before, and all he has got to do is to run his fingers through his hair and he's got it.

Speaking of the individuality of lumbermen we are inclined to the belief that, as a rule, they are a liberal class of people, and while possessing the faculty for driving a close bargain, do it in a businesslike manner and take undue advantage of no one. In making this assertion we are not doing it in the hope of securing the lumbermen's vote at the next election, but solely because we believe that our statement is correct.

But we are digressing. To digress, however, is no crime, therefore in all probability we will do it again. We were about speaking of some of the Toronto "lumber kings" and the part they take in the trade of the country. The best way to do this is to refer to each in the order of our calls, mixing up the larger and smaller concerns promiscously. Let us commence with that well-known and ever-reliable firm of

CHRISTIE, KERR & CO.,

whose head office is situated at 9 Victoria street. The heads of this business are Mr. Alex. R. Christie and Mr. Wm. Kerr, both of whom are among the best known lumbermen of the country. They possess the widest range of practical experience, coupled with an intimate knowledge of the wants of the trade, and for the many years during which they have been engaged in this branch of trade, have achieved an enviable reputation for fair dealing and prompt and liberal dealings with customers. The firm direct the operations of their large force of men from this city, from which point also they are heavy shippers of lumber to various American ports. Their extensive mills are situated respectively at Collingwood and Severn Bridge. They also handle the product of some 10 or 12 mills besides their own insuring direct rail connections south, and by water to all points west and south. The mills of this company are large, and fitted throughout with all the latest improved machinery and appliances, while the cut averages 100,000 feet daily, and gives employment to upwards of 150 men. The firm owns several of the finest timber limits in the north, which are convenient of access for bringing the logs to the mills. At the present time they have a large force of men and teams in their camps, and the output of logs this season will be unusually large. The facilities possessed by this firm for the prompt filling of all orders for home delivery, or exportation, of all descriptions of white pine, hardwood lumber, deals, laths and shingles, &c., are unsurpassed. We learn that the past season's operations have been fairly successful.

From here we step across the hall in the same building and enter the office of

WILLIAM LATCH,

wholesale dealer in hardwood and pine lumber, laths and shingles. This gentleman is one of the "old standby's," in the trade, having been actively engaged in the business for the last twenty-six years. The wholesale yards, of which Mr. Latch is the owner, are located at Cartwright, Ont., where large quantities of rough and dressed lumber of every description are kept in stock. Being possessor of a considerable amount of capital this gentleman has command of a very large trade, and is prepared at all times to undertake and fill the largest contracts. As a citizen of Toronto Mr. Latch is recognized as an influential and public-spirited man, and is identified with many movements calculated to promote the general welfare of the community.

Victoria Chambers, where we find ourselves at present, seems to have a peculiar fascination for lumbermen, as in addition to the two firms mentioned above, there are three others in the same building, equally worthy of mention. Of these we first visit

TENNANT & CO.

the *personnel* of which is Mr. J. Tennant and Messrs. Henry and Albert H. Colwell. The first two named gentlemen have been associated together in a business way for the past seven years, and are well and favorably known. Mr. Colwell, sr., has been connected with the lumber trade in Toronto for upwards of a quarter of a century, and is generally acknowledged to be an authority on all matters pertaining to this branch of trade. The firm do a wholesale trade in pine lumber, the bulk of which comes from Penetanguishene and the North Shore district. About one million feet per month is the extent of the business done. They state that the prospects for next year's trade are good, and express the opinion that a slight advance in prices will soon take place. The light stock on hand at the mills and the scarcety of cars for shipping combined, seem to effect the market towards this end.

GEORGE GALL.

Situated on the same flat as the last named firm we find the office of Mr. Geo. Gall, wholesale dealer in hardwood lumber. This gentleman has been connected with the lumber and building trades of Toronto for the past twelve years. He is a Scotchman, having left Aberdeen for Canada a score of years ago, and by strict attention to business has met with more than usual success. Mr. Gall's yard, containing on an average one million feet of lumber, is situated at the corner of Wellington and Strachan Ave. in the west end of the city. He purchases in both Canadian and American markets, and has a reputation for supplying the very best material obtainable. He reports prices firm, with a possibility of an increase.

On our way out of the building we make a call on

F. N. TENNANT,

a gentleman who has been more or less connected with the lumber business since a boy. He was a member of the late firm of J. & F. N. Tennant, who, a few years ago, handled, on an average, from 35 to 40 million feet of lumber annually. He has since gone somewhat extensively into the real estate business, and this in connection with his wholesale business in lumber, laths and shingles, keeps him busy. Mr. Tennant's principal purchases come from Midland mills. He informed us that the building trade of Toronto for the past year eclipsed that of any previous period, and that the prospects for next year were equally encouraging.

MUSKOKA MILL AND LUMBER CO.

Room 17, the Arcade, 24 King street west. This company was incorporated under the laws of the Province of Ontario in 1875. Its capital is $150,000, with a reserve fund of $100,000. The company own about 270 square miles of pine lands on the Georgian Bay, where are located extensive saw mills, which, with the vessels engaged in carrying their lumber, give constant employment to about 200 men. The facilities of this company for filling the largest orders at short notice, or undertaking the most extensive contracts, are unsurpassed. Its resources are of such a character that it is able to offer the most favorable inducements to the purchasing public, and can afford rates not easily duplicated. Mr. A. H. Campbell the head of the company, is a native of Scotland, and has been a resident of the Dominion since 1845.

JAMES CARNOCHAN,

proprietor of the Barrie Lumber Yard and Planing Mill, 61 Ontario street, and 356 to 366 Queen street east, conducts an extensive business, and is a representative man in his branch of trade. Mr. Carnochan carries a very large stock of every discription of lumber, including pine, spruce and basswood boards, scantling, lath, shingles, casings, mouldings, &c. In fact from this establishment the public can be supplied with every material essential to their building from cellar to attic. The premises occupied on Ontario street cover more than half an acre, while the yard on Queen street is upwards of an acre in extent. The lumber handled comes from the Muskoka, Georgian Bay and Ottawa regions. The business gives employment to about 15 men. Mr. Carnochan is a Canadian by birth, and has had an experience of fifteen years at the business.

Thinking that we had picked up enough notes in Toronto to supply sauce for LUMBERMAN readers for one month, and having espied a sign in the distance which read, "City Tonsorial Art Hall, we shied off to "get a clean shave, and remove the super-abundance of Toronto real estate which had very affectionately attached itself to our lower extremities. We were bound for the north, and at the mid-day Northern railway express steamed up to the Union depot we stepped on board and were soon on our way to the picturesque little town of

PENETANGUISHENE.

Many a time in the past have we travelled over this route. Then we knew the location of every mile post and farm house for many miles north of Toronto; but things have changed since then, and now we find ourselves almost a stranger in the hamlets which once were, but are now prosperous villages and towns. The Northern railway has changed also. What many for years have been calling a "one-horse concern" is now being equipped equal to any railway in Canada. It has become the principal line over which to reach the great north-west of Canada, and will ere long be generally recognized as the shortest and most direct route to those far-distant provinces. But while improvements by way of equipment are observable to the most casual observer, the slow speed at which trains are run has not been improved upon. For fear the management have overlooked this important matter, we might suggest that this is an age when people—if their wishes could be satisfied—would prefer to travel at the rate of a sixty-mile-an-hour wind-storm, even though there was a fair possibility of their ending their earthly career before they reached their destination. Now we believe we have said enough on this point, and if the directors of the Northern don't feel in accord with our ideas, we are satisfied in the knowledge that we have done our duty to a suffering public.

Just as we expected, we have been digressing again, and have only been brought to a sense of our duty to the lumber trade when speeding along the shimmering waters of Penetang. Bay. On one side we have a glimpse of the town on a high elevation in a distance, and to the left of us a dark sail of a fishing-boat here and there, and further beyond heavily laden schooners with their cargo of lumber, saw mills, docks, and forest.

Penetang. is certainly an attractive place in which to spend one's time during the summer months, but our sympathies turn to those who have anything to do with winter in this section of country. We heard enough of winters up there to make icicles sprout out of our boots, and that's all the experience we crave for.

The secret of this town's success is the extensive lumber trade which is carried on, there being about a dozen saw mills within a radius of five miles. A visit to some of these mills gave us an idea of the extensive trade being done.

"CHARLIE" MCGIBBON,

by which name the jovial and good-natured Reeve of the town is known, is among the foremost in this branch of trade. Placing ourself at his service we were shown through the mill of which he and his father are the owners. These mills have been established since about the year 1867, and from that time to the present have run continually during each season. The manufacture consists of every description of lumber, laths and shingles. The output of lumber averages from two and a half

to three million feet per annum, the bulk of which is shipped by boat to Sarnia, where the wholesale and retail yards are situate. As a rule about 20 men are employed in connection with this business, and the present season 40 men have been sent to the woods. Mr. F. McGibbon, the senior partner, is one of the oldest lumbermen at present actively engaged in the business in Canada, having already spent 32 years of his life at the work. He is a man of sterling integrity, and what he doesn't know about lumber is hardly worth finding out. By fair dealing and close attention to business he has accumulated a considerable amount of the necessary wherewith to keep him independent during his declining years. The business in Penetang. is under the entire control of his son, Mr. Charles McGibbon, who ranks as among the most popular men of the town in which he resides.

C. BECK & CO.

By far the most extensive industry of the town is the "Penetanguishene Steam Saw Mill," under the proprietorship of the above well-known firm. This mill is situated close to the bay, and has been established for the past 13 years. A fire, some time ago, completely destroyed the entire works, but Phoenix like, they have sprung up larger than ever, and within the new structure is now in use some of the finest saw mill machinery manufactured in America. The output consists of lumber, laths, shingles, creight and bill stuff, the cut of lumber the past season being in the neighborhood of 7,000,000 feet. About one year ago this firm nearly doubled its capacity by buying up the large premises and machinery of the Brentwood Lumber Co. which is in close proximity to their own. In their new acquired property, they propose manufacturing bill stuff almost exclusively. The area of land utilized in conection with this business, consists of 25 acres along the water front, with three wharfs for the shipment of lumber, etc. Nearly all the lumber which goes by water finds a market at Sarnia. Large quantities are also shipped by rail to Toronto and elsewhere in Ontario. Railway ties and deals have been shipped in considerable quanties to England during the past year, and this trade is expected to increase. On enquiring the prospects for next year's cut we were informed that the company then had 150 men in the woods, and that as near as could be judged at the present time a cut of from nine to ten million feet would be made during the next season. Mr. Beck complains severely of the discriminating rates against lumber dealers in that town who are compelled to ship over the Northern railway in order tc find some of the leading markets. He affirms that they are compelled to pay nearly double the rate which the railway company charge dealers in the North Shore district. Such a state of affairs as this will materially injure the lumber trade whereever such an exorbitant rate has been levied. The Northern railway evidently consider that they can act as they like in this matter, as the lumber has to be shipped, and there is no other line to carry it. Mr. Beck has been fighting this injustice for some time, but notwithstanding that he is a "solid Scotchman," his weight does not seem to have any effect Penetanguishene owes very much of its present prosperity to the firm of which we are now writing. Mr. Beck evidently does not believe in employing assistants to look after his business, for he seems to have an eye to everything, and is hardly ever absent from his works. He is said to have accumulated a considerable fortune and is certainly entitled to his gains.

MR. D. DAVIDSON

operates a large saw mill on a peninsula across the bay, and for many years has done an extensive and prosperous business in the manufacture of the different kinds of lumber. It so happened that our visit was inopportune, as Mr. D. had left the same morning in company with a party of sports, with a Winchester on his shoulder and a rather weighty bag of cartridges at his side, for a few days hunt on the North Shore. We never had much ambition for tramping the woods after the beast of the forest and the fowl of the air, but on this occasion we were somehow drawn into the net. In company with a couple of "crack" shots, who, by the way, had intended to accompany the expedition of the morning, but had turned up too late to join the party, we set out for the neighboring woods prepared to destroy anything that happened to present itself. Time nor space will not permit of a rehearsal of our experience during that day's tramp. Suffice it to say that we had a deadly encounter with a striped rabbit and an owl. The latter we left in the tree, after sending something less than a dozen bullets after it, and bringing down a few feathers. The former we placed in our "game bag," and as the sun sank in the horizan, a homeward move was made. On reaching the town we bartered our game for three bottles of ginger ale, and if not satisfied with the day's sport were at all events quite ready to seek our virtuous couch.

THE SEASON TO CUT TIMBER.

Much has been written as to the time for cutting timber, and as authorities differ, I propose to give that time as near as possible. This is a branch of industry to which little or no attention has been given by our woodmen, who always have and are continuing to cut at any and all seasons of the year, regardless of the injury they inflict on themselves and others. I have asked the question of some who made it a business to get out timber the year round (excepting the season when they are apt to be idle and lay off, which will be the very part they should have been the busiest,) "What is the best time to cut?" The answer invariably is, "We can sell, and the time of cutting makes no difference." This question is never asked, especially by the manufacturer or the party getting it out, and many wonder why they get so much poor or brash timber, and attribute all this to the timber itself, when in reality much of the trouble is due to the ignorance of those who cut the timber. There is a time to harvest timber (or fell the trees if nothing more) just as much as there is to harvest wheat. A farmer would never think of cutting a field of wheat when it is just headed out or in the milk, expecting that he would be remunerated for so doing, or that he was going to get a full and plump berry therefrom; and so in regard to cutting timber, we must observe the season, and when the timber is ripe, the pores or openings filled, and the tree is a solid mass, as it were; for the the right season the pores or grains, as I will call them, are filled with the gum and oil that has formed after the sap has ceased flowing.

The custom has always been to cut timber in the winter time, because then the farmer, who does the most of the cutting, has the most spare time for so doing. In late seasons, when winter runs well into spring, and there has been little thawing but almost continual freezing, the damage is light, but in a reverse season cutting proves fatal.

Timber at the present day is treated somewhat different from formerly. Instead of the farmer cutting, as he formerly did, much of it is cut by parties who take it in bulk and cut at any time to suit their convenience, and as no complaint is made, it does not make any difference to them. This timber question has been much discussed at different times, and is to-day, but no one that I have seen has struck the key-note, or given definite time for cutting. Some there are doubtless who may know all about it, but I have never seen it in print, nor have I ever talked with any one who could give detailed information. Cut only when the timber is ripe. To fell it simply will do, and then you can let it lay and cut it up for what you want it for at your leisure, or in a few months. There are no exceptions to this rule, and all timber comes under it as a rule, and the time is the same for all. All must be benefitted, every person who uses timber, even to those who burn it, for fire wood cut at the right season is certainly worth fifty per cent. more than that cut out of season. Think of all those who use timber and the millions of feet that are sacrificed. England cuts her oak, her best timber, for the bark, or to save it, and at the expense of the timber, for the timber is ruined if cut when the bark peels.

I think that it is important to know the proper time to harvest timber. To individuals and to governments much has been written as to preservatives, but the best preservative is to cut in the right season. There are no doubt preservatives which can be applied for certain purposes, but they will always be externally and not internally. Injecting, as some have advocated and advised, is all bosh, as will be seen when thoroughly understood. The oil and gum that the timber is impregnated with is its own preservative, and if cut in the right season needs no other; in fact, to impregnate with any other liquid or solution, or attempt to do so if cut in season, it will be necessary to displace the timber's gum and oil, and to do this you must destroy the timber itself in the operation of displacing. If the timber is impregnated in the same liquid, fluid or water that the displacement took place in, it will again be filled in part with its own liquids or gum. This displacement theory is all wrong, as the operation destroys the life of the timber.

Timber is never so well preserved as when done by nature and its own preservatives. I am convinced if this is observed strictly no decoction is necessary, only where an external application in some way would be beneficial. Among those that are good, are raw or hot linseed oil, crude kerosone oil, its extracts, hot or cold. Creosoting, as spoken of in the *National Builder*, is no doubt one of the best of the many spoken of by that authority, but I shall say only as an external preservative, and not as an internal, as claimed. I doubt not of its great usefulness if properly applied. Many of the others spoken of by the same authority are good, no doubt. The goodness of all are as an external remedy.

The time to cut, which in my judgment is about right, is mean time, being October and November. This is the best time, no doubt. Mean time, from middle of August to first of January, and the extremes from middle of July to the first of February. You may go outside the extremes, but it is not safe. Sap commences flowing in January, it may not be much, but it is sufficient to hurt the timber; and do not commence earlier than the 15th of July. The sap has no doubt ceased flowing, but the oil and gum which the pores are filled with now have not sufficiently ripened or hardened; therefore, confine yourselves as much as possible to the mean time, October and November. This is about the time for this latitude. There is, or can be, no set time, as the seasons and locality vary. Here in central New York it varies six weeks, and all these must be taken into consideration. March, April, May and June are the out-of-season months.—*J. B. W., in Coach and Saddlery.*

The average weight of 1,000 superficial ft. of Douglas fir lumber is from 3,300 to 3,500 pounds, and it is worth from $9 to $25.

General News Notes.

Currier's old mill at Ottawa is being demolished.

Mr. Samuel Frazer has sold all the pine, oak and basswood on his Midland property to Chew Bros., for $2,000.

Mr. Herbert B. Rathbun is engaged with a large crew of men in collecting logs around the shores of the Bay of Quinte.

Messrs. Hillard & Dickson, Pakenham, have sold their limit on the Clyde to Mr. W. C. Caldwell, who intends to commence lumbering on it at once.

Mr. W. H. Carpenter, of Fort William, has large gangs of men at work in the woods this winter. He expects to have a larger cut next season that usual.

The Buffalo Lumberman's Exchange which is composed of lumber dealers in Buffalo and vicinity, will hold weekly meetngs throughout the winter, at the Merchants Exchange Committee rooms.

Mr. A. Hoppins, of Kingston, has purchased the stock of the Bedora mill on the K. & P. railroad. The stock is composed of 185,000 feet of hemlock, joisting and scantling, and 146,000 shingles. He has also bought 600,000 feet of lumber from the Calabogie mill, and 100,000 feet from John Schellington, of Hinchbrooke.

The lumber shipments from Montreal during the season of navigation just closed were:—To the United Kingdom, 97,804,336 feet; for 1885, 89,667,407 feet; from Montreal and Lower St. Lawrence to River Platte, 20,088,204 feet; for 1885, 31,747,142 feet. Total shipments for the season to all places, 130,602,923 feet.

A gentleman down from the lumbering regions of the Upper Ottawa reports that the number of logs made so far this season is far in advance of last year. He says this was the finest fall of log cutting he has seen for many years. Drawing has already commenced in many districts. He anticipates bright spring prospects for the trade.

Recently a man named Thomas Clark, of Bristol, engaged in one of Messrs. Gillies Bros. shanties on the Temiscamingue, was killed by the falling of a limb on his head whilst engaged in chopping. His body was taken home for burial with great difficulty, first being drawn on a hand sleigh a distance of 25 miles to a lake, which delayed the party a day, during which time the lake froze over and the party proceeded.

Some important changes are announced in two of the leading houses in Quebec trade. Mr. H. T. Walcot has retired from the firm of Messrs. J. Burstall & Co., of Quebec, Montreal and London; the business will be continued under the same style by the remaining partners, who have appointed Mr. H. W. Lightbourn to take charge of their London office. In addition to their Canadian business, Messrs. Burstall & Co. have arranged to sell ditch pine timber, deals, &c., for shipment from southern ports. The retiring member of this firm, Mr. Walcot, has entered into partnership with Mr. Edward Harper Wade, and will carry on business at 17, Gracechurch Street, London, under the style of Walcot & Co., and at Quebec and Montreal, under the style of Smith, Wade, & Co. From the latter firm, which has hitherto been carried on at Quebec, Mr. R. H. Smith, who was associated in partnership with Mr. E. H. Wade, has retired.

Supt. Evans, of the Deseronto shipyard, will have an exceedingly busy winter. He is making extensive preparations for the erection of the new steel steamer to which we referred last month, and which will be of large proportions. He will also build a large steam barge for the Rathbun Company. The now vessel which is intended for the Rideau trade, will be 99 feet keel, 106 ft. over all, 21 ft. beam and 6 ft. 6 inches depth of hold. He is also rebuilding the yacht Norah and will make many changes and improvements on the fleet of the Deseronto Navigation Company. Brisk times may thus be expected in the shipyard for the winter.

In conversation with a prominent lumberman on the Gatineau river and district an Ottawa *Journal* reporter learned that the winter so far has not been favorable to the lumbermen on account of the scaccity of snow. A great many teams with provisions for the shanties were stuck at points along the road. The prospects of a good cut this year are quite as favorable as last, and if a good spell of cold weather comes after Christmas the want of snow until the present time will not greatly inconvenience the lumbermen. "What firms will do most extensive work this winter?" Well, James McLaren will work his old limits as well as the Hall limit which he purchased some time ago. His operations will be considerably larger than any former year. Then Hamilton Bros. and Gilmour & Co. will, I think, do about the same as in former years." "What is the quality of timber taken out of the Gatineau regions?" "On the whole it is first-class timber both clear and large, but there is a great deal of drawing to do, which of course detracts from the value and then the length of the drive is also another drawback." "Then this is considered as a good season by the lumberman on the Gatineau?" "Well I do not say that, but there are very good prospects for a fair cut this season."

AN ENGLISH OPINION OF CANADIAN SAW-MILLS.

R. CHARLES WOOD, who was for many years manager of Mr. Chappell's saw-mills at Pimlico, and who until lately carried on the business of saw-miller on his own account at Camden Town, has recently returned to England from Canada and the United States, where he has been travelling for the purpose of making himself acquainted with the Canadian and American methods of running saw-mills, and to see the sights of the countries. The *Timber Trades* reports the following interview with this gentleman, which, being of interest to our readers, we reproduce:—

"I left Liverpool for Quebec on the 27th of August. The passage was very pleasant until we neared the Straights of Belle Isle, which is the summer route to the Gulf, the winter route lying between Cape Ray and Cape North. Here owing to the unusual number of icebergs floating south, it was intensely cold. One of them had assumed the form of a cathedral, in outline not unlike Notre Dame, and, with its sparkling roofs and glittering walls, was really a splendid spectacle. An experience of iceberg regions such as I had would enable one very easily to comprehend the wretched plight in which the inhabitants along the neighbouring coast and at the summer cod fishing grounds of Labrador were recently placed by the presence of those mountains of ice.

Well, we reached Rimouski on the following Sunday week, and Quebec at eleven o'clock next day (Monday). From Quebec I went to Toronto, and there called on Mr. Hargreaves, the well-known shipper, by whom I was very kindly received, and taken across to the Waubaushene Lumber Mills, owned by the Georgian Bay Lumber Company. These rank among the best and largest mills in Canada. They are situated at the head of the bay, in the county of Simcoe. The distance from Toronto is 112 miles.

I saw much to surprise me, the methods and appliances they employ being of the latest and most approved description. In glancing round the place, the thing that most impressed me was the important part that machinery played in every operation. The lumber is not handled by the workmen as it is in this country, being in nearly every instance manipulated by ingenious mechanical appliances. The output of the mill 150 standards per day of ten hours. The working hours are from six to six an hour between twelve and one being allowed for dinner. On Saturdays the men leave off at a quarter to six. They are paid, the mill sawyers, 12 dols. a week; and the labourers, 6 dols. a week, besides which they are supplied with three meals a day, breakfast, dinner and supper. The men live in the village of Waubaushene, for whom it has been erected by the Georgian Bay Company. It can boast of two churches, a library, a doctor, and a school master. It does not possess, however, a public house or drink-shop of any kind, being under the Scott law, which prohibits the sale of intoxicants, and generally the Company seem to have given considerable attention to the spiritual, intellectual and physical needs of their *employes*.

The mills are at the water's edge, and the logs are drawn up out of the Bay on to the first floor of the mill by means of what the Americans call a log haul-up. This consists of a large launder, if it may be so styled, inclined from the mill to the water, and supported by A-shaped tressels, made of two logs with a cross-piece on top. Inside the launder runs an endless chain, on the links of which spikes are fastened at the top of the launder. At the other or water end a man stands on a log raft, and as the logs are floated to the haul-up he guides them with an ordinary hitcher to the spiked links of the endless chain, and they are conveyed lengthways to the first floor of the mill, where all the cutting is done.

The logs are broken down with a gang, or what we should call a frame saw. First, the logs are squared with a circular saw to about 11 in., and are then cut down to inch boards. In this latter process there is great waste, each cut taking out five-sixteenths of an inch of sawdust. This is doubtless owing to the peculiar formation of the saw-tooth used in American saw-mills, and which is rendered necessary by the amazing rate of speed at which the saws are run. It is really astounding to watch the rapidity with which the log car in front of the saw is worked backwards and forwards. I saw a log 15 ft. long, 22 in. diameter, cut into twelve 1in. boards in a second or two under a minute. As I have already said, very little handling of the stuff takes place, and the boards fall from the saw on to endless chains running along frames, and are automatically conveyed outside the mills to the trams. They are then taken all over the yard for stacking.

The slabs taken off the round logs with the circular saw, when squaring, also fall on endless chains, which convey them to the gang slab slasher, or a series of circular saws, placed at intervals of 4 ft. apart. The chains run in guides, and are provided with spurs, or spikes, which helps to hold the slabs firmly, while a lug carries them to the saws. They are then cut into 4 ft. lengths, which are sent down a shoot to another set of saws, arranged three-eighths of an inch apart, where they are sawn into laths. All laths in America are sawn; at least, I did not see a single builder using rended laths. The slabs are also sawn into boxwood for the New York market, and the output of this stuff alone amounts to two trucks per day.

"As you are aware, Mr. Wood," we observed, "the question is frequently asked in our 'Practical Notes' column, 'What is the best means of disposing of saw mill waste?' What is the plan adopted in the Waubaushene Mill, where, of cause, there must be an enormous waste?"

"Well, the larger items of waste, such as the ends of the 4 ft. slab lengths, are burnt in the boiler fire-boxes as fuel, but the very refuse, such as saw-dust, &c., was formerly thrown into the Bay. In consequence, however, of the passing of laws prohibiting the deposit of mill refuse in rivers, the company erected a bottle-shaped iron furnace, 40ft. in diameter. The refuse is introduced into the furnace through on opening at the shoulder, the means of conveying it there being an endless chain arrangement. Verily, endless chains are endless in America. The cost of erecting this furnace was $25,000.

The yellow pine converted by the Georgian Bay Company is drawn from the district lying to the south of Lake Superior. Six other mills besides the Waubaushene are owned by this company, and I was told that they have sufficient timber in their limits to keep their mills going twenty years. The pine of this district is of first-class quality. Mr. Dobell, who draws some of his supplies from the same source, told me that pine is being there cut into 42 in. planks without showing a knot.

"In travelling from Toronto to Waubaushene," said Mr. Wood, "I noticed many miles of cleared woodland. A peculiar feature of it is the number of stumps which it contains. These are from three to four feet from the ground. I thought this an evidence of considerable waste in felling, and I asked Mr. Hargreaves what was the reason of it. 'The snow,' he said, 'is here about three to four feet deep in the winter, when the felling takes place. Of course it would be too expensive to remove the snow, and the trees are cut down at the surface of it.' I also noticed at Toronto that the streets are paved with cedar wood. When they want to make a new street they plough up the ground. A large scoop or shovel, drawn by a horse, comes along and takes out of this displaced earth a depth of about 12 inches. A layer of sand 4 inches deep is then laid and levelled, and, upon this foundation of sand only, blocks, of round cedar, 8 inches long and cut out of the branches of the tree, are placed. Except in the better streets, the pavements are also composed of wood. Toronto seems to be a thriving city, and things are cheap, except clothing and house rent. Houses, say, which in Camden Town could be rented for £40 a year, would realise an annual rental of £100 in Toronto.

"From Toronto I proceeded to Chicago, and stopped to see the Niagara Falls *en route*. I have heard much talk about utilising the immense water-power of these falls for driving mills, &c., but, as far as I could learn or see, nothing of any great extent has yet been done."

"What do you think of the States after Canada, Mr. Wood?" we asked.

"Well, Chicago is a very different place to Toronto and other Canadian cities. I was informed before I left Toronto that I should find the devil at Chicago; and at times, and in some places, you almost do. There seems to be little, if any, regard for the Sunday, as labour of all kinds is carried on as on ordinary days; and at the Board of Trade building, in which are located the corn, cotton, and hog rings, it is a perfect pandemonium when business is being transacted. Chicago is a magnificent city, laid out in squares, each square containing four blocks of buildings, which are among the highest and largest to be seen in any city in the world. Certainly I have never seen in any city so large a number of big buildings. Here it is not 'Great is the Diana of the Ephesians,' but 'Great is the Mammon of Chicago.' 'The least erected spirit that fell is the great object of worship, and everything seems sub-ordinated to it. To give you an instance—the motto of the States is, 'In God we trust,' and an enterprising, but irreverent, Chicago tavern keeper has on his sign the following prostitution of it:—'In God we trust; all others must pay cash.' In Canada, and in the States particularly, I noticed that children were being worked at a very tender age, and on mentioning the fact to a Chicago citizen, I received the truly American answer: "I guess it's a free country, and people can do as they like." This again is an outcome of their insatiable thirst after 'the almighty dollar.' A Factory Act in my opinion would be a priceless boon to the children.

"From Chicago I proceeded to Quebec, and on arriving there accompanied one of Mr. Dobell's clerks to the Montmorency Falls, which lie about seven miles below the city. The mills situated here are owned by Messrs. Hall Bros & Co., and are worked by water-power derived from the falls. The distance between the mills and the falls is about 200 yards. The latter have a width of 50 ft., and a descent of about 250 ft. A dissectible pipe composed of conical shaped joints, each joint being 4 ft. in diameter at the base and 3 ft. 7 in. at the apex, is placed in the water at the right bank of the stream, near the edge of the falls. The water is let in and shut off by means of a valve. The water flows into the pipe at the base or big end of the first joint. The joints are placed in this inverted order, the small in the big end, so that the water may acquire additional impetuosity. The water rushes from this pipe into a shoot 200 ft. long and 5 ft. wide, passes into a trough or a reservoir 14ft. square, and its course is then directed at a right angle into a launder, underneath which are six vertical cylinders conveying it to a corresponding number of turbine wheels, which constitute the motive power of the mills. Six gang saws are employed for the purpose of squaring the logs on two sides. The partially squared logs are then cut into planks and deals of various thicknesses. A series of saws subsequently cross-cut the deals into the different lengths they make. They are then conveyed into the yard by means of a shoot, at the bottom of which stands the culler, who marks the various qualities before the deals are removed for piling. When possible, the slabs I have already mentione are cut into boards of various sizes, when, however, this cannot be accomplished, they are converted into shingles, squares for broom and mop handles, &c. Every week 12,000 logs, ranging from 12 to 16 ft. long, and 11 to 13 in. diameter, are passed through the mills, which run throughout the night as well as the day. The workmen are divided into two gangs. The first starts working on Monday at 1 a.m., and continues up to 8 o'clock, at which time the second appears on the scene. These men work up to 4 o'clock in the afternoon. The first gang then reappears and works until midnight. This process is repeated throughout the week, and it amounts to this—that the gangs work alternately one day sixteen and the next eight hours; the men are paid by the piece. Messrs. Hall Bros. & Co., in addition to utilising the water power for driving their mills, also keep going by it a quantity of dynamos which supply electric light to the mills, and also to the city of Quebec. I understand that Messrs. Dobell, Beckett, & Co. have purchased the past season's output of these mills. The logs cut up consist entirely of spruce. Here, as at Waubaushene, the waste is very great, each saw, without exception, taking out three-eighths of an inch of sawdust.

SUCCESSFUL MANAGEMENT

A superintendant who has charge of a factory employing a large number of hands, writes as follows to the *American Machinist*:—Frequently of late I have been requested by a number of managers, to tell the secret of my success in shop management. It is a hard question to answer, but I will in a simple way through your paper try and explain how I manage the factory of which I am superintendent. When I first took charge I found everything out of joint, and such a thing as system utterly unknown.

The first few days I let things go on in the old way until I became acquainted with the men and the men with me. I then set about to bring order out of chaos. My first step was to discharge every man who I found unwilling to submit to the new order of things. The first man discharged was the engineer. He had done as he pleased so long that he had an utter contempt for law and order. On finding himself locked out of the factory for disobedience he kicked the door down. A few more discharges followed, which proved sufficient to convince the men I meant business.

I then divided the factory into five departments, picking out in each the brightest fellow to act as foreman. In each department I put a responsibility upon each man, that he might feel himself of some importance. I interested myself fully in all things transpiring in each department. When I arrive in the morning I am very careful to visit each man at his post and say good morning. I ask after those absent and visit the sick. At night I place myself so all have to pass me and so good night to each.

I have at all times treated every one like a gentleman What is the result? Every man is doing his duty. The factory is turning out more goods with fewer hands. We have a place for everything and everything in its place. The factory is clean, and I feel that I have the respect of every man about the place. I think then the secret of my success in shop management is

"Do unto others as you would have others do unto you."

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U.S. Patent Office, up to Nov. 25th, is specially reported by Franklin H. Hough, Solicitor of American and Foreign Patents, 925 F. street N.W., Washington, D.C., who will furnish copies of patents for 25 cents each.

352,976—Planing machine.—J. P. Hoyt, Aurora, Ill.

353,109—Saw drag.—C. W. Wright, Democracy, Ohio.

352,242—Saw gage.—O. E. Williams and J. R. Brewster, Windsor, Vt.

352,937—Saw-handle.—G. E. Siebler, Dayton, Ohio.

353,260—Saws. Wheel for band,—G. M. Hinkley, Milwaukee, Wis.

352,988—Wood-polishing machine.—A. Bridgman and J. Challoner, Omro, Wis.

353 302—Lathe. Turning,—S. W. Goodwin, Toledo, Ohio.

353,530—Saws. Guide-roll for band,—G. S. Black, Indianapolis, Ind.

353,385—Wood-working machine.—J. Gassey, New York, N. Y.

353,539—Saw-tooth. Insertible,—E. S. Snyder, Snyder's Mills, W. Va.

HISTORY OF THE SAW-MILL.

HOW surprised I was on seeing in a museum, a long time ago, such things as scissors, seal rings, necklaces, and pairs compasses, that were taken from Egyptian tombs 3,000 years old!

But, after all, men were men 3,000 years ago, and women were women. They had the wants, the needs, the vanities of men and women, and they had brains not unlike our own to supply them.

The most boastful Yankee (not that Yankees are more boastful than other people) in some of the rooms of the British Museum is obliged to confess that the ancients originated a great many good notions which we moderns have only improved upon.

For instance, there are few tools more ancient than the saw. All the ancient nations appear to have had it; certainly the Hindoos, the Egyptians, the Greeks and the Romans. The saw may have existed even before there were any men on earth.

There is a creature called the saw fly, with the saws in its tail, which is actually used for sawing the stems, leaves and fruits, wherein its eggs are to be deposited. There is also a saw-fish, the long snout of which is a saw. It is said also that the original inhabitants of the Island of Medeira found a ready-made saw in the backbone of a fish.

The Greeks had a pretty story attributing the invention of the saw to the accidental finding of the jaw-bone of a snake by one Talus, who used it to cut through a small piece of wood. Being a slave, and finding that this jaw-bone eased his labor, he made a saw of iron, and thus gave mankind a new and most valuable tool.

The ancient saws differed from ours in two ways. The teeth were so arranged that the cut was made by pulling instead of pushing; and the teeth, instead of being set one to the right and one to the left alternately, were set so that ten or a dozen in succession were slanted one way, and the same number the other way.

The ancients have several varieties of the implement. The Greeks, for example, had cross-cut saws for two men, also saws for cutting marble into slabs. And they had a kind of tubular saw for hollowing out a marble bath-tub, similar in principle to the method now employed.

Among the pictures uncovered in the buried city of Herculaneum there is a representation of two genii sawing a piece of wood on a carpenter's bench very much like ours and using a saw with a wooden frame similar to those now employed. Still more strange, the frame saw tightened with a rope and stick, such as our street wood-sawyers use, was probably as familiar to the Romans as it is to us.

A saw-mill, however, by which wind, water or steam is made to do the hardest part of the work, was not known to any ancient nation.

Sawing by hand, next to digging a stiff clay soil, is about the hardest work that men ordinarily have to do. It is therefore not surprising that our ease-loving race began to experiment a good while ago with a view to applying the forces of nature to the performance of this toil.

A learned German investor who has investigated the subject very thoroughly states that the first trace of saw-mill yet discovered is in the records of the German city of Augsburg, for the year 1337.

The reference is slight, and does not fix the fact with certainty. But there are two saw-mills near that city, which are known to have existed as far back as 1417, and they are still used.

Before that valuable invention, all boards and planks were split with wedges, and then hewn to the requisite smoothness with the axe.

The splitting of boards is still practiced in remote settlements, as I myself have seen, and it is recorded of Peter the Great, of Russia, that he had much difficulty in inducing the timber cutters of his empire to discontinue the method. At length he issued an edict forbidding the exportation of split planks. Even in Norway, covered with forests as it was, there was not one saw-mill before 1530.

Nowhere in Europe, it appears, was the introduction of the saw-mill so long resisted as in England. In 1663 a Hollander erected one near London; but it brought upon the poor man such an outcry and opposition that he was obliged to abandon it.

The sawing of timber by hand furnished occupation, at that time, and long after, to large numbers of strong men.

In every town there was saw pits, as they were called, for the convenience of the sawyers, one of whom stood at the bottom of the pit and the other on the log.

We can easily imagine that when every beam, plank and board, thick or thin, had to be sawed by hand, the sawyers must have been a formidable body, both from their numbers and their strength.

After the failure of the Dutchman in 1663, there was no serious attempt to start another saw-mill in England for more than a hundred years.

In 1767 an English timber dealer of large capital built a saw-mill to be moved by the wind. It was thought to be a great and difficult enterprise, and it attracted much public attention. Some years before an author had explained the advantages and economy of saw-mills; then the society of arts gave the scheme of building one their approval, and, finally, the mill was actually built by an engineer who had studied the saw-mills of Holland and Norway.

No sooner was the mill complete than the sawyers assembled in great force and tore it to pieces. The Government compensated the owner for his loss, as was just. Some of the rioters also were convicted and imprisoned.

A new mill was then built, which was allowed to work without molestation, and proved so profitable that others were soon introduced.

In no part of the world, probably, has the saw been more minutely and curiously developed than in Great Britain, where they have saws so fine as to cut diamonds, and circular saws nine feet in diameter and a quarter of an inch thick.

They have also veneer saws so accurately adjusted as to cut 18 slices of veneer from a rosewood plank an inch thick.

In London they will put a log of mahogany upon the mill and cut it into slices so thin that the sawdust weighs more than the veneer.

Yankees have beaten this performance. They take a piece of mahogany or rosewood, soften it by steam, and cut it into veneers with a knife, without making a grain of sawdust.

Daniel Webster tells us that his father had a saw-mill after his removal to New Hampshire, at the source of the Merrimac river.

Daniel, who was by no means fond of labor at any part of his life, liked nothing better in his boyhood than to attend this saw-mill, because when he had put his log in position and started the saw, he had 16 good minutes for rest or reading before the business required further attention.—*Journal of Progress.*

CANADIAN PATENT LAWS.

Recently, at a meeting of the Inventors' Institute, held in London (Eng.), Mr. Henry F. Coombs, of St. John, New Brunswick, read a paper on "Canadian Inventions and Canadian Patent Laws." He stated that Canadian inventors were a numerous body, and their number was rapidly increasing. In the year 1885 the Canadian Patent Office issued 2,200 patents, the official fees received amounting to $69 000. From this had to be deducted $10,000, showing a net profit of $59,000—certainly a pretty penny to collect from people for using their brains. In Canada the cost of a patent was about $20 for five years, this being the Government fee. The patent could be continued for ten years longer by paying $40. The money was payable in instalments, upon the failure of any of which the patent would lapse. The total duration of a patent was fifteen years. The agents' fees were all they could get, but the ordinary charges were $40 to $50 inclusive of Government fees and drawings, models being required. The business had out-grown the facilities of the department, which required reorganization. Their patent office was organized when the Canadian patents aggregated a few hundreds annually. The department was at present an appendage of the Department of Agriculture. New accommoderation was required for models deposited, at present models costing scores of dollars each being stacked like lumber A room assigned for such a purpose would be of value as part of a museum where the progress of art could be practically illustrated. Previous to the federation, each of the older provinces had its own separate patent law, but in the year 1872 a general Act was passed, and this, with the amendments of 1873-4-5 and 1883-4, made up the existing patent laws of the Dominion. He considered that the later amendments were not in the interests of inventors. Patents were issued only to inventors or their assigns. Provisional protection was secured for incomplete inventions by the issue of *caveats*. This was a secret document and was good for twelve months, conditional on no application being made for a patent for a similar invention, in which case a notice was issued to the holder of the *caveat*, calling upon him to perfect his invention, in three months, in order to obtain the benefit of priority. Canadian inventors complained that some parts of their patent laws were unjuet to them, and they claimed the repeal of such parts on the ground that the State could not afford to deal unfairly with any of its citizens. He then quoted extracts from the Canadian Acts on the subject, in justification of this remark. He stated that, according to Canadian law, if a promissory note given for an invention did not contain on its face the intimation of that fact, the vendor of the invention was liable to a term of imprisonment not exceeding twelve months. In conclusion, he advocated the unification of the principles of the law of patents throughout the empire, so that English inventor should be able to say that his patent was his own wherever the flag flew.

NEW BRUNSWICK WOOD EXPORT.

A very considerable falling-off in exports of lumber and timber from New Brunswick appears by the comparison of shipments in this year and the like period of former years made by the St. John *Globe* of the 9th Oct. The total figures are this year 108,909,416 feet as compared with 126,497,856 feet last year. The falling off in shipping is represented by twenty-seven vessels and 21,000 tons. One of the features of the year's business is the decrease in the number of steamers coming here for deal cargoes. While twenty three steamers of 32,451 tons cleared in 1885, only seven of 6,864 tons have taken cargoes this year—a circumstance due, of course, to the exceedingly low rates that prevailed during the summer. By the tabular statements of the quantities sent to various ports it is seen that Liverpool, as usual, retains the first place as a market:

SEASON 1886.

Port.	No. of Vessels.	Tons.	Deals. Sup. feet.
Liverpool	44	51,098	43,541,657
London	4	4,163	1,739,566
Bristol Channel	22	19,173	17,807,121
Ballyshannon			
Belfast	5	4,810	4,338,776
Barrow	2	1,981	2,136,891
Cork	8	4,576	4,471,189
Coleraine	2	565	603,713
Dundalk	4	1,365	1,592,756
Dublin	7	4,876	4,540,702
Fleetwood	7	4,740	3,907,589
Galway	3	1,460	1,439,136
Glasgow	2	1,262	772,318
Llanelley	2	765	708,208
Limerick	3	1,819	1,687,000
Londonderry	5	3,222	3,032,378
Queenstown	3	2,093	2,111,421
Sligo	3	996	1,098,212
Tralee	2	863	886,654
Continent	9	5,201	4,795,521
Africa	3	2,288	2,169,036
Other ports,	14	6,253	5,511,572
Total	154	123,449	108,909,416

Fifteen other ports received one vessel each, whose aggregate tonnage was 6,253 tons and their cargoes reached 5,511,572 feet. The names of the shippers were, in order of amount, A. Gibson, R. A. & J. Stewart, W.M.Mackay, Guy, Bevan & Co., Geo. McKean, S. Schofield, Knight & Co., C. Hamilton & Co.

As to square timber, there has also been a falling off, the export of birch being less than half the quantity sent last year. The figures are as follows:

Shippers.	1886. Tons Birch.	Tons Pine.	1885. Tons Birch.	a
W. M. Mackay	2,156	1,614	8,822	ri-
S. Schofield	1,265	202	3,394	ous
A. Gibson	1,056	8	7	m-
R. A. & J. Stewart	11	76	....	ide
G. McKean	8	....	....	nd
	5,496	1,800	12,224	He
Ports.				d
Liverpool	3,939	1,109	10,487	2,
Avonmouth	....	76	....	...
Carnarvon	501	....	800	....
Crookhaven	....	....	363	....
Dublin	125	....	....	....
Fleetwood	400	706	....	658
Glasgow	512	9	....	....
Hare Island	....	....	7	....
Queenstown	....	....	563	....
Wexford	8	....	4	....
Continent	11	....	....	....
	5,496	1,900	12,224	2,973

The *Globe* ventures the opinion that the shipment for the remainder of the year will be comparatively light, and the above proportions between the two years will probably be maintained.

In 1885, the number of vessels was 181; tonnage 144,803 tons, carrying 126,497,000 feet.

Protection Against Mill Fires.

We find, upon examination of the "record of fires in the United States," that the largest ratios of losses to premiums received are upon saw and planing mills. This at once to thoughtful minds presents the question as to how to remedy and prevent this great destruction of property. The trouble has been in most cases the great outlay of money necessary upon the part of manufacturers of lumber for an extensive fire protection plant.

A new company—the Manufacturers's Fire Equipment Co., of 155 and 157 Broadway—has been organized to fill and cover this increasing want. They agree to equip extensive manufacturing properties with all the appliances and devices known to skilled mechanics and experienced underwriters as will control any fire in its incipient stages. They rent this equipment to mill owners. They contract for insurance, also, and in most cases the rent of the equipment and the insurance combined does not cost any greater sum than is now paid by the manufacturers for insurance only.

Another feature combined with this is the careful and complete inspection at stated periods by expert inspectors, so that cleanliness, order and care of management can be guaranteed. After ten years, this equipment becomes the property of the manufacturer absolutely, and he is released from all further obligations to the Equipment Company. This seems so fair and practicable that every leading manufacturer or worker in wood should avail himself of the advantages offered.—*New York Lumber Trade Journal.*

THE CANADA LUMBERMAN

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. MORTIMER, PETERBOROUGH, ONT.

Terms of Subscription:

One copy, one year, in advance $1 00
One copy, six months, in advance 0 5

Advertising rates furnished on application.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER, Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

Our Readers who write to Advertisers in this Journal, will oblige both the advertiser and Publisher by mentioning the "Canada Lumberman."

UMBERMAN congratulates Mr. Bronson, of Ottawa, on ion to the Local Legislature.

Canadian contemporary, the LUMBERMAN, has donned of green, and appears to be flourishing like the green ee under Editor Mortimer's management.—*Lumber rld*, Buffalo.

THE trade outlook in England shows no signs of improvement, the chief topics of interest being failures, both actual and prospective. This state of affairs unfortunately exists not only in London, but also in Liverpool, Glasgow and elsewhere.

WE direct attention to the new advertisement of H. W. Petrie, of Brantford, Ont., which will be found on back of cover. Mr. Petrie is well known as a dealer in new and second-hand machinery, and can supply the wants of everybody from a needle to an anchor, at extremely low prices.

THE motion of the publishers of the *Northwestern Lumberman*, of Chicago, for an injunction against *The Timberman*, of the same city, has been dismissed by Judge Tuley. The court wisely held that there was no ground for interference. We heartily congratulate *The Timberman*, and hope that it will enjoy a prosperous New Year.

THE outlook for business among the lumberman of the Ottawa district during the present season is of a most satisfactory character, and if the fact that more lumber was sold during the past year for the United States market, than has ever been sold during the same period in the past, can be accepted as a criterion, the business done will certainly be a source of envy to other lumbering centers, whether Canadian or American.

MESSRS. C. J. WOOD, of H. H. Gordon & Co., and Geo. W. Hotchkiss, Secretary of the Chicago Lumberman's Exchange, have recently returned home from a trip to British Columbia, It is reported in one of the coast papers that these gentlemen have arranged to purchase a large body of timber west of the Rocky Mountains, for an eastern syndicate. The statement is probably true, as the parties named do not deny it. They speak very highly of British Columbia.

IT is stated that the American Exhibition, London, 1887, will open on May 2nd. A large force of men are at work, and a quantity of material is on the ground at Earl's Court. The management are assured of a larger number of desirable exhibits than they can well handle. The original scheme of the exhibition, if well carried out, will, in fact, place before the British public quite as many subjects of interests as was the case in the Indian and Colonial Exhibition, and it is to be hoped that the great American show will prove popular.

MR. DANIEL C. MAGUIRE, of Montreal, one of the largest shippers in the Dominion, has assigned, and called a meeting of his creditors. The liabilities are half a million dollars. The principal creditors are, Bank of Montreal, Merchants Bank, Quebec Bank, Bank of Ontario, People's Bank, Senator Ross and Charles Sampson. The firm owns 22 vessels engaged in the lumber trade worth over a million dollars. The trouble is stated to be due to the over doing of the lumber and shipping business of the river Platte. The failure has caused great excitement in financial circles.

"A MAN out West bought a bedstead, the wood of which was so green that one warm spring day it broke out all over with little groves of waving branches. In autumn the children picked the chestnuts from the side pieces, and the next spring tapped the headboard for maple sugar." We have never had reason to doubt the veracity of editor Van Fredenburg of the *Lumber World* until now, but after reading the above item our good opinion of him has dropped below zero. How any man after writing the above can ever expect to play on the "harp of a thousand strings" is more than we can understand.

IT is particularly pleasing to us to note the satisfaction expressed by the friends and patrons of this paper throughout the Dominion and our valued contemporaries both in Canada and the United States, with regard to the improvements which we have already made in the LUMBERMAN. What we have done has simply been an initial step towards still more extensive improvements. The typographical appearance of the paper is by no means equal to what we intend making it, and we hope by the next issue to present the paper in an entirely new dress of type. We have undertaken to make the LUMBERMAN a worthy representive of the great lumber industry of Canada, and by the assistance of the trade we hope to have our ambitious fully realized.

NEW railway projects are of almost daily occurrence in Canada at the present time. Every new point that promises business for a road if being sought out, and at the rate at which rail-laying is going on at present, it will not be long before our railway system will be as complete as a spider's web. Nothing could be more desirable for lumbermen and other tradesmen than good railway facilities. It will not only open out new and desirable sections of country, but will tend to reduce the high rates charged for transportation now existing. No matter how strong financially any company may be, when keen competition exists the tendency of rates is downward. Not only are we in need of reduced freight rates but also in passenger traffic, and it is only a matter of time before this step in advance will be made.

DOMINION Surveyor-General Deville, speaking of the result of the surveye in British Columbia, says the resourses of the Province have been greatly underestimated; that the timber wealth is enormous and the extent of land adapted for agriculture greater than has been heretofore supposed. He has a high opinion of the provinces as a fruit growing centre. Of Banff, the site of the new national park, he says the scenery is unrivalled; and he thinks the Canadian Pacific railway the most stupendous monument of engineering skill which the world has yet seen. This is loud talk, but it cannot be much too loud to express the actual facts. The climate of British Columbia is greatly in its favor, and must aid in attracting capital and industry to assist in the development of its agricultural, mineral and forest resources.

A CORRESPONDENT asks the *Iron Trade Review*:—"What is the correct spelling of that indispensable little tool, called the monkey wrench? What had the monkey to do with it anyhow?" And in reply the editor of that journal says: "Capital M-o-n-c-k-e-y, so named from the inventor, Charles Monckey, and not from our Darwinian ancestor. We hope the statement in the papers is not true, by the way, that Charles Monckey is living in poverty, in Brooklyn, N. Y., while parties who bought his patent for $2,000; are making millions of dollars every year. At any rate, he ought not to have the additional indignity of a misspelling of his invention cast upon him, as was recently done by a well-known machinery paper that ought to know better. Even Webster's Unabridged does not appear to know the derivation of the word."

TO EVERY one sending us $1.25 we will mail to their address THE CANADA LUMBERMAN for one year, and a copy of "Scribner's Lumber and Log Book," which is a work every lumberman and wood-worker should have. It gives tables for finding the correct measurement of scantlings, boards, planks, cubical contents of square and round timber, saw-logs by Doyle's rule, stave and heading bolt tables, cord wood, prices of lumber per foot, speed of circular saws, weights of wood, strength of rope, felling of trees, growth of trees, tables of wages by the month, price of standard logs, interest tables, etc., etc., to which is added 60 pages of new tables, making 160 pages in all. It is the most complete book of the kind ever published. It is worth many times the price of the subscription, and no lumberman or wood-worker can afford to be without it. This offer is good for a limited time only, and should be taken at once.

THE American consul at Ottawa, Ont., furnishes the following summary of the values of the various products of the forest exported to the United States from the Ottawa consular district for the fiscal year ending June 30, 1886: Sawed pine lumber, $2,045,809; box shooks, $46,428; lath, $26,456; railroad ties, $11,604; pickets, etc., $25,751; match blocks, $8,450; telegraph poles, $2,033; hemlock bark, etc., $4,500. Total export, $2,225,000. In addition to this, 35 per cent was used for home consumption. The total amount of lumber manufactured by the Ottawa mills for the year is placed at 288,000,000 feet. The principal destinations of the consignments sent from Ottawa to the United States were Burlington, Albany, New York and Boston. A large proportion, however, of the lumber sent to the United States has been exported from thence to South America, the West Indies and Africa. The square timber trade, which at one time was so largely carried on along the tributaries of the Ottawa river, has been almost entirely abandoned, nothing having been done in that way during the past year.

THIS re-sawing business is getting to be a great thing. A New York correspondent of a prominent lumber journal writes: Machinery men who are constantly devising labor-saving and product-increasing machines will soon have to stand a heap of cussing from the lumber dealers who have heretofore sold box makers one and one-fourth inch stuff. The box manufacturers have all along bought one and one-fourth inch pine to re-saw into one-half inch, and as experiments with re-sawing machines using thin saws have proved entirely successful, it has been found that Canada pine boards sawed plumb inch, as is the custom, can be re-sawed and produce lumber fully as thick as formerly obtained from one and one-fourth inch stock re-sawed on an old style machine. It is also claimed that Michigan pine boards can be re sawed and produce stock 1-16 inches in thickness, which for many purposes is thick enough. An investment of say $1,000 in a thin re-sawing machine will more than save its cost in a year in any ordinary box factory.

WE have pleasure this month in drawing attention to the new advertisement of The Polson Iron Works Co., of Toronto, (Limited), which appears on third page of cover. This company is a consolidation of the well-known firms of Wm. Polson & Co., Toronto, and Thos. Worswick & Co., Guelph. They have recently opened up in their new and extensive premises on the Esplanade, foot of Sherbourne street, in which they have located some of the finest iron and wood-working machinery to be found in the Dominion. The main building, which is constructed of corrugated iron throughout, is 240x50 feet in size, and contains two stories. This building is divided into six departments: machine shop; blacksmith, boiler, boat-building, pattern and pipe shops. In addition to this there is a large wareroom, two stories, 70x25 feet. The manufacture consists of the "Brown" and "Allan" automatic engines, steam yachts and launches, vertical, hoisting and marine engines, a large variety of slide valve engines, particularly constructed for saw-mills; iron tools and boilers of all descriptions; etc. The company claim that their "Brown" automatic engine, for economy of fuel, durability, regularity of speed, and other features, surpasses that of any other. While visiting these works we were shown a number of elegant yachts which this firm have been building, which clearly indicate that the company are experts in this important branch of their business. In addition to the manufacture of the class of machinery above referred to the company buy and sell all classes of second-hand machinery. Saw and planing mill owners in particular, requiring anything in this line, will be amply repaid by visiting these works.

A FEW years ago trade publications in the Dominion were comparatively scarce, but with the wonderful strides made in all classes of manufacture, trade journalism has become almost and indispensible accessory to each and all of the leading branches of industry. One by one journals of this nature have been established, and although in the past it has been up-hill work for the publishers to impress upon the minds of manufacturers and others their duty towards publications devoted to their respective branches of trade, and the profits which would naturally accrue, by extending to such a liberal patronage, still this difficulty, to a certain extent at least, has been obviated, and the manufacturer and dealer in Canada, as in the United States, now realize its importance. In the matter of advertising, manufacturers in the past have depended almost entirely on the daily press as mediums through which to introduce their wares, but while this, to a limited extent, has proved beneficial, they have paid extravagant rates for a large circulation, of which seven-eighths, possibly, would pass into the hands of persons in no way interested in the class of goods they are offering for sale. But this is by no means the case when class journals are patronized. Each paper has a separate and exclusive field to cover; every man who receives such is directly or indirectly interested in *everything* its pages contain,

both reading matter and advertisements. Should they be in need of new machinery, or new appliances, they will naturally turn to the journal specially devoted to their interests, and the man or firm who manufacturers such—and have business enterprise enough to make the fact known—is the one who is benefitted thereby. As an instance of the success which has already been achieved by technical journals we have pleasure in mentioning that handsome monthly, the *Dominion Mechanical and Milling News*, of Toronto, the only objection to which is its unpardonable long name, our italic letter being the sufferer in this case. Mr. C. H. Mortimer, the publisher has, since assuming control of this paper, materially improved it in many respects. Millers and manufacturers have reason to be proud of their organ, and at the extremely low price of one dollar per year none should be without it. Other similar journals in Canada are also entitled to a large measure of credit, and we trust that as time rolls on, the trade press of Canada will be generally recognized in every calling, as it has been for years in our sister country across the border.

CONCURRENTLY with the advent of the New Year, the first issue of the seventh volume of the CANADA LUMBERMAN is placed in the hands of its constituency of readers. For the first time since assuming the editorial management of this journal it is our privilege and pleasure to extend a hearty, friendly New Year's greeting to each and all of our readers and friends, sending our best wishes for their continued happiness and prosperity. Since the commencement of 1886 our readers has more than doubled, and the many tokens of confidence and appreciation we are receiving from one end of the Dominion to the other, stimulate us in our work, the duties of which we hope to perform for many years to come. By degrees we are becoming familiar with the requirements of the trade, and any deficiency of the past, we hope to make up for in the future. To successfully conduct a paper as the LUMBERMAN should be conducted, every one who desires to see the great timber interests of Canada prosper, should do his share towards furnishing information to the editor for publication. We are pleased to note the remarks of a correspondent which appear in another column, anent this matter, and also to perceive that others have also supplied valuable matter for the current issue. No one need hold off for fear of encroaching on our space. We want *everybody's* opinion, and will see that due prominence is given to all matters which have a bearing on the trade. The CANADA LUMBERMAN is the organ of no individual man, clique of men, or company, and is therefore prepared to discuss all questions independently and fearlessly, with regard only to the well being of the great industry, the cause of which it aspires to espouse. The year just closed has, on a whole, been a fairly prosperous one for Canadian lumbermen. There certainly have been times during this period when our lumbermen have realized a stagnation of trade, but everything considered the season's operations has been pretty generally encouraging. The unsatisfactory condition of the lumber market in Europe for some time past has materially lessened the shipments which would have been made from Canadian ports had a more active demand existed. What the outcome of the depression in Europe will be is hard to determine, but from our English exchanges it would appear that with the opening of spring a new impetus will be given trade, and business generally will gradually pass from under the cloud which now hangs so threateningly over the whole country. Such a change would be hailed with delight by Canadian lumbermen, and it is to be hoped that conjecture may ere long change into reality, and that the year 1887 may be remembered in the future as one of the most prosperous in the history of the trade.

EXCHANGE ECHOES.

Contemporary Opinion on the Various Matters of Interest to the Trade.

The Wood Worker.

It is painful to the lover of nicely manufactured lumber, to visit some, a great many in fact, of the country hardwood saw mills, and witness the manner in which good logs are butchered. The holders evidently hold the mistaken opinion that no brains are needed in this business.

The Chicago Timberman.

There is considerable complaint in northern Maine of the operations of Canadian lumbermen in Aroostook county, that state. They cut lumber on the St. John waters, float it down to New Brunswick mills, where it is manufactured, and thence shipped back to this country free of duty. The forests of Aroostook are thinned out, while foreigners reap the profits.

Lumber World, Buffalo, N.Y.

Market reports and trade advices combine to show a general tendency to advance prices and the latter show that the tendency is based solidly on a large business. Supplies are not excessive and demand is large. Prices remain firm and inquiries are sufficiently numerous to give hope for a good business far into the winter. There is not what might be called a "boom," nor is a boom desirable. Steady growth is far preferable, and that is now the condition of the lumber trade.

The Wood-Worker.

A lumber journal calls attention to the danger which is supposed to lurk about the band saw mill in the shape of very fine dust which is produced by that machine. Attention is called to the fact that fine flour dust, and many other substances when reduced to this state, are highly inflammable and explosive in character, hence, why not wood dust? It is said that two or three late saw mill fires were caused by these very fine particles of wood, set on fire by a heated journal. Whether these claims have been proven or not it will be wise for owners of band mills to see that the mills are kept clean as possible, and the dust all brushed off before leaving them at night. Wetting them down before leaving might be a good idea.

Northwestern Lumberman.

Nearly all the news from the woods is to the effect that the logging season set in a month earlier than last year, and it is generally stated that so far the conditions for cutting and skidding have been excellent. It is hardly necessary to say that these conditions have been fully utilized. No matter how good the market may be next season, there will be plenty of lumber, and probably a surplus. Should the demand from any cause be light, there will be an overstock. So long as the manufacturers are asserting that at the present prices of lumber and stumpage there is little or no profit in manufacturing in many cases, and as the tendency of stumpage is upward, all this disposition to rush logs in is a hard conundrum to solve. If lower prices for lumber rule next year, the manufacturers should not complain. No man should grumble if obliged to lie in a bed that he makes with his eyes wide open.

Northwestern Lumberman

If the fine dust that collects in a band mill is occasionally the cause of a fire why may not some of the mysterious fires in other saw mills be attributed to the same cause? No matter what kind of a saw is used there is a collection of fine dust in out of the way places, and in a circular or gang mill there is no good reason why this dust, under certain conditions, should not be subject to spontaneous combustion the same as though it were in the band mill. Many a mill has gone up in smoke when it was absolutely known that the fire started in the main body of the mill, where no heat or lamp was used or required. One of the conditions which would render dry sawdust liable to ignite spontaneously would be the mixing of oil with it, and this might be readily brought about by the oil being scattered by the force of the machinery. There are men who know how to oil machinery and others who do not. With the former enough is plenty, while the latter are everlastingly droping the oil boxes. When oil is applied too plentifully it drips or is thrown off by the machinery, and why should it not come in contact with the fine dry sawdust when such sawdust is in the way? The theory that the destruction of mills, oftener than is supposed, is due to spontaneous combustion is certainly a tenable one.

COLONIAL WOODS.

(*From Messrs. Duncan, Ewing & Co's. Wood Circular, Liverpool, 4th December*, 1886.

YELLOW PINE TIMBER—The import from Quebec during November has been exceedingly small, comprising only 5,000 feet of Square and 54,000 feet of Waney Board Wood. This has enabled merchants to deal more with their yarded stocks, and the deliveries of both descriptions during the month amounted to 106,000 feet, as against 151,000 during the same period last year. Stocks are very moderate. Three vessels from Quebec have arrived here since the 30th ultimo, and practically the import season may now be considered over. The wholesale transactions during the month comprise a parcel of 1st quality Waney Pine, 17 inches average, at about 23½d per foot ex quay, and 2nd quality, 19 in. average, at 18d per foot ex quay. A parcel of G F A Square Pine, 60 feet average, has been sold at 20d, and a parcel of Miramichi Pine at 13d per foot ex quay. Red Pine Timber—No arrivals and no sales to report. Oak Logs—The export for the month has been only 4,000 feet and the consumption 25,000 feet, as against 45,000 and 73,000 feet respectively during the same period last year. The stock on hand is only about half of that of last year. There is a fair demand for prime wood and prices are well maintained. Ash—The import has been light (2,000 feet), whilst the consumption amounts to 5,000 feet. No wholesale transactions to report. Birch—The import has been moderate and the demand good. Sales comprise a parcel of Quebec, 18 inches average, at 19½d. Elm—A parcel of Quebec has been sold at 22¼d per foot, ex quay. Quebec Pine Deals—The import though light has been quite sufficient for the demand. No wholesale transactions to report. Quebec Staves—No arrivals. Cull Pine have been sold at £45 and Cull Puncheon at £12 10s per mille.

BARK Vancouver, loaded with spruce deals by Messrs. King Bros. for Londonderry and wrecked at Manicougan, is breaking up, her cargo floating about in all directions.

MR. GARRET, proprietor of a mill at Ilfracombe, ran against the lever in his mill and was thrown on the large circular which severed his left arm completely off near the shoulder. His body was also gashed in several places.

THE Charlemagne Lumber Company at its annual meeting in Montreal elected the following directors:—Messrs. Robert Reford, D. W. Ross, A. McLaren and J. Dillon. At a meeting of directors afterwards Mr. Reford was chosen president and Mr. Dillon secretary and treasurer.

PERSONAL.

[Contributions from or concerning our friends and patrons are freely welcome to this column. The name of the sender must always accompany such notices.]

A prosperous new year to one and and all of LUMBERMAN readers.

Mr. J. T. Lambert, lumberman, of Ottawa, is likely to be elected alderman for one of the wards of that city.

Mr. W. H. Rowley, local manager of the Merchants' Bank, has accepted the position of manager of the establishment of Mr. E. B. Eddy, at Hull.

Henry Fox, proprietor of the large planning mills on King street, west Toronto, was found dead in his arm chair on Christmas morning, where he had been left sitting when the family retired the previous night. His death is attributed to a stroke of paralysis. He had been in excellent health. He was 61 years of age.

MR. JOHN BOLTON, formerly of Ottawa, who has been contracting in the lumbering business and railroading at the Pacific Coast for years, returned to the Capital during the past month. Mr. Bolton was in the employ of Mr. J. R. Booth, some six years ago, after which he left for the Pacific Coast, and has been fortunate enough to build up a successful bussiness.

Hon. J. G. Thorpe, of Eau Claire, Wis., president of the Eau Claire Lumber Company, was at Winnipeg, Manitoba, last week, with some other Chippewa capitalists. Mr. Thorpe is interested in a large lumbering operation on Bow river, in the province of Alberta, where he has been looking over the improvements made, and figuring on the business to be done next year.

OBITUARY.

The many friends of Mr. David Moore, the well known lumberman, will grieve to learn of his death, which occurred at his residence, River View, on the Aylmer Road on Thursday Dec. 7th. On the Friday previous he was afflicted with a paralytic stroke, the fourth of the kind which he had experienced. For six days he lingered on in a semi-unconscious state, attended by Dr. Henderson and surrounded by the members of his family, who watched day and night at his bedside to the last. Mr. Moore was born in Hull 62 years ago, and his interests have ever since been centured in that locality. He leaves a large fortune, acquired by dint of perseverence and business ability. From his earliest years he had been indentified with the lumber business, and at the time of his death was one of the oldest, if not the oldest lumberman in the country. At an early age he succeeded his father, David Moore, sen., in the lumber business established by him, and developed its restricted operations to an enormous extent. One rule of his business career, and one to which he attached great importance, was to deal entirely on a cash basis, and he was wont to pride himself upon the fact and point to it as one of the secrets of his success. He owned and operated extensive limits upon the Ottawa, Petewawa, Desmoines, Mattawa and Deep Rivers, and delt exclusively in logs and square timber. In his transactions with his fellow merchants he gained their universal respect and admiration. Some twenty years ago he built River View, his handsome residence on the Aylmer Road, about three miles from the city, and there, surrounded by every means of comfort, he dispensed hospitality with a generous hand. In 1854 he married Miss Catherine Cutler, by whom he had six sons and one daughter, all of whom survive their parents, Mrs. Moore having died about four years ago.

Deceased's funeral obsequies took place on the Sunday following his death, and the remains consigned to their last resting place in the Hull Cemetery. From about two o'clock till the conclusion of the ceremonies, the Aylmer Road was crowded with people. At the deceased gentleman's residence at Riverside, all the space about the house was occupied by carriages. The house, which was thrown open, was filled with friends and acquaintances, anxious to get a last look at the face of their deceased friend. The room in which the casket lay was beautifully ornamented with flowers, and the handsome coffin was buried beneath wreaths of beautiful flowers presented as tributes to the memory of the deceased. Conspicuous among the floral offerings was a large and magnificent pillow of flowers from the sons of the deceased, upon which was worked in words "Our Father." Among those who attended the last rites were noticed nearly all the lumbermen in the Ottawa district, besides representative men from the cities of Hull and Ottawa, and from the County of Ottawa. About 2.30 o'clock the service at the house was conducted by the Rev. Frank Smith, pastor of St. James Church, Hull, at the conclusion of which the remains were borne to the hearse by the pall bearers, Messrs. Hiram Robinson, E. B. Eddy, G. B. Pattee, J. R. Booth, C. Smith, R. McConnell; W. R. Thistle and F. H. Kirby. The cortege then moved to Hull, the first four carriages were occupied by the pall bearers and immediately following the hearse came the carriages occupied by the sons and near relations of the deceased. The funeral procession was over a mile and a half in length.

General News Notes.

There are 1200 men engaged in the Gilmour shanties.

The product of the Minneapolis saw-mills for 1886 was 282,636,091 feet.

Messrs. Butchart, Bros. & Co., lumber dealers of Rimouski, have assigned.

About 300 miles of a Kippewa timber limit was sold recently at $1,000 a mile.

J. Millon Williams, a pioneer miller and lumberman, of Arden, Ont., is dead.

By an explosion of dust in a planing mill in Cambridgeport, Mass., six men were fatally burned.

A quantity of logs were caught by the cold weather, in the St. John river, N. B., and frozen in.

There are about 150 planing mills and other shops making wood finishing materials in Chicago.

A St. John, N. B., paper informs us that the big raft at Joggins is now conceded to be a failure.

The total cut of logs in the Duluth, Minn., district for the present winter is estimated at 140,000,000 feet.

L. P. Morin's sash and door factory at St. Hyacinthe, Que., was burned Dec. 2. Loss $18,000; insurance $3,500.

It is estimated that nearly 10,000,000 feet of lumber will be required at Duluth for elevator building before next fall.

F. Curran, Quebec, left a lumber camp in Auckland township, cut a hole in the ice with his axe, and deliberately plunged in.

Operations in Messrs. Bronson & Weston's shanties are now in full blast, and they report that this is a most favorable fall for log making.

A woman works in a Kalamazoo (Mich.) cooper shop who can make as many barrels in a day as any of the men who work with her.

The Wm. Cane & Sons Mfg. Co., of Newmarket, Ont., recently offered Mr. John A. Sharp, of King township, $1,000 for fifty-eight pine trees.

The first saw-mill built upon Puget Sound was erected in 1851. It was a small water power mill, with a daily capacity of from 8,000 to 10,000 feet.

A plank twenty feet long and nine feet wide, without knot or blemish of any kind, is one of the contributions of British Columbia to the Liverpool exhibition.

Messrs. Hurdman & Co., Ottawa, have made preparations or a much larger cut of logs this season than hitherto, and have already sent 700 men to the woods.

The Parry Sound Lumber Co's steam barge *Lothair* and barge *Corisande* have been frozen in at Port Colborne, where they were run for shelter during a gale.

It is said that Chinamen smuggle opium from British Columbia into Puget Sound towns by concealing it in sticks of timber, which they tow across the line.

The Thayer Lumber Company, of Muskegon, Mich., will put in 10,000,000 feet of hemlock in the vicinity of Herses, Mich., according to local newspaper reports.

W. H. Fraser, late of the firm of Gatliff & Fraser, lumber dealers, Emerson, Man., has gone to Edmonton, where he will go into business with his brother in the saw-mill.

The Conger Lumber Company, of Perry Sound, Ont., recently sent its foreman, Mr. William Beatty, to Alpena, Mich., to study American methods of lumber making.

It is reported that Messrs. Perley & Pattee, of Ottawa, have sold their cut of pine deals and siding for next year to Mr. Cox, of Liverpool. No terms or prices have transpired.

Broad & Sons axe factory, St. Stephen, N. B, has lately received a large amount of new and costly machinery, making their establishment second to none of its kind in the Dominion.

Sales of timber, says a Quebec exchange, are taking place every day, and manufacturers are getting rid of a good deal of stuff. Prices are stiffening, more especially in hardwood, elm, ash, etc.

The feeling has become almost general among the largest lumbermen that it is more profitable to cut logs then to purchase them on contract. This means that the contractor's occupation has almost gone.

It is is stated that the new watch factory at Canton, Ohio, will have one and three-quarters miles of shafting, about 8,000 pulleys, and at least fifteen miles of belting. There will be a handsome order for one or more houses.

The schooner Clara E. Simpson, from Windsor, N. S., for Baltimore, Put into Portsmouth, N. H., November 19, with loss of her foretopmast and jib boom. She sprung a leak in a gale and threw overboard her deck load of 250,000 lath.

John McRae, of Glencoe, Canada, has purchased a tract of pine in the vicinity of Keyes Lake, near Florence, Wis., of Brooks & Pumpelly. He will get out square timber for the foreign market. The timber will be hauled to Florence, shipped by rail to Escanaba, and thence by water to its destination.

A great revival is sweeping over northern New Brunswick. It is said to be unequalled in the history of the provinces.

Advices from New Zealand state that a company has been organized to construct a cable from New South Wales to British Columbia at a cost of $10,000,000. An annual subsidy of $500,000 is expected to be obtained from the colonial and imerial governments jointly.

The Canadian lumbermen cut the cream of their logs into deals for the English market. Deals are three inches thick, ten feet and upward long, and nine inches and upward wide. They are assorted into firsts, seconds, thirds and fourths, and these grades only are exported.

Owing to the fine weather, says an Ottawa despatch, the Montmorency and Chaudiere saw mills are enabled to go on sawing at the rate of about 4,000 logs during the twenty-four hours, the result of which will be that but comparatively few logs will remain over the winter unsawn.

The Parry Sound Lumber Company's schooner, "Jane C. Woodcruff, the wreck of which was mentioned in our last issue, has been abandoned, having been found to be so badly damaged as to be not worth the expense of taking her off the shoal and repairing her. The cargo may yet be saved.

During the past season Ottawa lumbermen have been experiencing great difficulty in obtaining lumber cars and barges for the shipment of their lumber. Large quantities of lumber still remain, and now that shipment by boat has ceased, large shipments are expected during the winter by rail.

Shipments of lumber from the port of Dalhousie, N. B. during the past season, were; 18,615,329 s. f. deals, scantling and boards, 551 tons birch timber, with ash, maple, staves and laths. These were shipped in forty-two vessels whose tonnage was 21,947 tons.

Says a Minneapolis, Minn., journal: Oshkosh sawed 50,000,000 feet of lumber this year against 80,000,000 last year. Where is the man that said the Green Bay district was denuded of its pine years ago? Oshkosh will continue to keep the sash and door trade of St. Paul and Minneapolis demorlized (by railroads,) for the next fifty years.

The lumber shipments from the port of Dalhousie, N. B., during the past season, comprised 18,615,329 superficial feet of deals, scantling and boards, 551 tons birch timber, 83 tons pine timber, 550 tons spruce timber, with ash, maple, staves and laths. The shipments show some increase over those of last year, and not very much difference from those of 1884.

Germany has 34 000,000 acres of forests whose estimated value is $2,500,000,000, and whose annual revenue is $50,000,000. Great care is taken of the state forests. In Russia replanting is systematically carried on at an expense of $500,000 a year. The imports exceed the exports by 2,000,000 tons. Every possible precaution it taken to prevent the wastage by forest fires, so common and so enormous in the United States.

Lumber for sounding boards of instruments is very carefully selected, and air-seasoned for about a year, with six weeks of subsequent kiln-drying in a dry-house at a temperature of not over 120 F. This slow process of drying is necessary for all sounding lumber. After the lumber is planed and edged it is carefully assorted, matched and glued into boards of an average size of four by five feet. The entire boards is generally planed three-eights thick.

On Thursday afternoon, November 25, the schooner "P. E. Young," of Toronto, arrived at Niagara loaded with lumber. Taking advantage of a fair wind she sailed for Queenstown on Friday without reporting to the Customs, and returning on Monday was seized by officers and held subject to the decision of the Customs Department at Ottawa. On Monday evening the captain was told by the collector that he could leave by depositing $100 subject to further decision.

The Canadian Pacific Railway always with the comforts of the travelling public at heart, offer the following very liberal arrangement for Christmas and New Year's holiday travel:—Return tickets at single fare between all stations on its line, Dec. 25th good to return till Dec. 27th, 1886; and on Jan. 1st, 1887, good to return till Jan. 3rd, 1887; and at fare and one third, Dec. 23rd, 24th and 25th and Dec. 30th and 31st and Jan. 1st, 1887, good to return till Jan. 4th, 1887.

During the month of November there were recorded seventeen fires in the United States, each with a loss of $10,000 or over lumber manufacturing mills or factories employed in using lumber largely. Forest fires aggregated a loss of $85,000; chair and furniture factories $105,000; lumber mills $140,000; carpenter shops, sash and door factories $20,000 wagon factories, $25,000; piano factories, $25,000 and planing mills $70,000. These items alone represent a loss of $560,000 for the month, a severe tax on these great industries.

A prominent Saginaw lumberman, a manufacturer for fifty years, than whom there are none more competitent to judge, pronounces the big mill at Duncan, Mich., the finest mill he ever saw, and he has seen nearly all he gilt edged mills in the country. The late Thompson Smith, besides being a master financier, was also a man of great mechanical genius, and in building the big mill much labor-saving machinery was used of of his own design, which is used only by this mill. The Duncan City plant is one of the most valuable in the state.

The Manitoba and Ontario Lumbering Company intend going into lumbering on a very large scale this winter, says a Winnepeg exchange. Their limits are all on the Minnesota side of the boundary, but their mills are situated at Keewatin, whither logs are brought by Rainy River and Lake of the Woods. They will this winter cut probably 15,000,000 feet. Last year it was only 6 000,000, and they have at their mills at Keewatin some 8,000,000 feet of logs.

The past season has been a red letter period for the lumber industry, and the outlook for the coming year is regarded as exceedingly bright. The following is a carefully prepared but unofficial estimate of the cut of the leading Chaudiere lumber men during the past summer: Mr. J. R. Booth, 60,000,000 feet; Messrs. Bronson & Weston, 60,000 000 feet; Messrs. Parley & Pattie, 50,000.000 feet; Messrs. Hurdman Bros., 25,000,000 feet; Messrs. Grier & Co,, 15,000,000 feet. It is reported in lumber circles that Mr. Stewart has purchased the controlling interest in the firm of Messrs. Grier & Co.

The C. P. R. mill, about two miles west of Sudbury, will be kept running all winter, The Company have several parties cutting logs on their limits in the township of McKim. There are two firms lumbering on the Wahnapital River 12 miles west of here. The Emery Lumber Co. have three camps in operation on this stream cutting logs. Their operations will be less than last winter. Timmins Gorman are also operating one camp on this river, cutting logs and timber. On the French River and tributaries there are several new firms, and the business done this season will be much larger than the last season.

No further attempt is to be made to entice the big Nova Scotia lumber raft further into the water. It is being rebuilt. A steam derrick has been erected, and the timber is to be drawn up the shore. The timbers for the ways are to be five feet longer than in the present raft, and the angle of slope for the ways will be increased. The new raft is to be 600 feet long, an increase of 200 feet on the present one, and will be completed in May next. The expense since breaking down has been $4,200 and rebuilding will involve a further outlay of $2,000. Still, it is said, the owners will be able to avoid loss if this new attempt succeeds.

The improved French method of preserving wood by the application of lime is found to work well. The plan is to pile the planks in a tank, and to put over all a layer of quicklime, which is gradually slaked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less time according to thickness. The material acquires remarkable consistence and hardness, it is stated, on being subjected to this simple process, and the assertion is made that it will never rot. Beechwood prepared in this way for hammers and other tools for iron work is found to acquire the hardness of oak, without parting with any of its well-known elasticity and toughness, and it also last longer.

A case which involves some very interesting points promises to come before the Ottawa courts shortly in connection with the sawdust nuisance in the Ottawa river. The complainant, Antoine Ratte, is a well-known boatman, who purchased property on the Ottawa 22 years ago with the view to make a profitable living out of the renting of boats, &c. Had the river remained in the same condition he claims that he could have more than doubled the value of his property and capital. The saw mill industry, however, has killed off boating, polluted the water and turned the beautiful stream into a stretch of sawdust, slabs, lathe, &c. Ratte says his business has been ruined thereby, and claims $74,300 as compensation. He threatens that unless this sum is paid he will enter a suit for damages against the mill owners.

The shipments of lumber which take place yearly from Ottawa value far up into the millions. The outlook for the coming season is most flattering. All the lumbermen are unanimous in stating that the cut this season will not be below the average, while two expect to double their cut. The amount of lumber manufactured during the past season was in advance of that manufactured during any previous year, and it is clear that the amount manufactured next year will show another large increase. The amount of lumber manufactured by the Ottawa mills during the past season is as nearly as possible 288,000,000 cubic feet. The greater quantity shipped has been sent to the United States, but almost all the coarsest grades were consigned to Montreal for home consumption. The principal destinations of the consignments to the United States were Burlington, Vt., Albany, New York and Boston. Excepting in a few cases where consignments were shipped via Montreal direct to England, but little export trade was done from Ottawa, save to the United States. A large proportion of the lumber sent to the United States has been exported thence to South America, the West Indies, Africa, and other foreign markets. The prices of lumber in the various markets fluctuate according to the freight charged from Ottawa, the lumber being sold there on a basis of about $16 per thousand cubic feet, to be delivered on the cars or barges all freight charges to be borne by the purchaser. During the past season nothing has been done in square timber. Hardwood is not touched by Ottawa lumbermen except occasionally for private use.

THE LOCATING OF MACHINERY.

BY JOHN KANE, "OBSERVER."

OF the many people who purchase machines, there seems to be but few who give much thought to the matter of locating them. They will perchance cast their eyes to the line shaft, and see where they can most easily take out a length, put on a pulley to drive the machine in question, re-couple the shaft, place the belts and start up the machine; or they may select some part of the floor that has the most open space, forgetting all other considerations, and place the machine there. Again, others want a machine to stand at right angles to the line shaft, but not knowing how to lead the belts to the machine, give it up and do what they consider to be the next best thing, which may be entirely unsuited for the purpose intended. In either of these cases, as well as many others, the machines are a continual source of delay and trouble, costing a great deal more time and money to operate them as well as to get work to and from them.

I have seen a buzz or hand planer placed in the darkest corner of a shop, requiring a gas light almost all the time; I have also seen upright shapers so close to a wall that one-half of their work had to be done on the next one, thereby causing delay and extra cost of production. Again, I have known of large planing and matching machines so placed that all the lumber that passed through them had to be handled at least twice as much as it would have been if a little consideration and study had been done on the start.

A great part of the success of some establishments is largely due to the advantageous location of the various machines used therein. Light being absolutely necessary to the production of good work, it should be one of the first considerations. An illustration of this fact is had by comparing the amount of work performed by a man on a machine in good, clear daylight, with that done by the same man, on the same machine, while using gas or other artificial light (electric light is not taken into consideration here). Convenience in getting stuff to and from a machine is another important item. No machine that is tucked away in a corner, or has its surroundings of such a nature that extra exertion and work have to be employed to supply it, can do justice to its maker, operator, or owner; the machine may possibly do as much work but it will be at an extra expense.

Another important feature to be considered in locating a machine is that it should have plenty of room. It is neither pleasant nor profitable to have a saw-table and buzz planer so close together that every time either operator steps back with his work he is compelled to climb upon the other's back, neither is it just the thing to have a board running through a rip-sawing machine strike the mortising operator in the back, until he wishes the saw was at least three or four feet away in his rear. You see there is a good deal of backing to my arguments in favor of ample room. Why, I would give them plenty of room if only for the same reason that Mark Twain invented his scrap-book, viz: to save barrels of profanity.

Finally, a lot of machines should be so placed in relation to one another, that no piece of work would have to pass a machine without being operated on, if necessary. It is poor policy to have a machine operator pass his work clear to the other end of the shop for the next process, and then back to the middle of the shop, and so on through all the processes. I have in my eye an establishment that took lumber in at one end and brought the finished work out at the same door, and I can truthfully say that each piece that was cut up as it entered was carried up and down the whole length of the shop at least three times, and that, too, when there was not the least reason for so doing, as there was plenty of room and light everywhere. I said there was no reason for it; there was: the owners lack of studying and reasoning faculties when he started, and they have developed nothing better yet. After the stuff was sawn into lengths and widths, it would run against a boring machine, around a sandpapering machine, and under an upright shaper to reach the planer, when planed it would go through a like devious path to reach the buzz planer, and so on until it was taken to the finishing room. How they managed there I don't know, as I was glad to get out of the machine room, and considered that I had accomplished quite a feat with my big feet. It is needless to say that other concerns in the same line of business do not fear the competition in trade of such a shop as the one just mentioned. They have no need to; such shops are generally as untidy and wasteful as they are inconvenient. System is one of the fundamental principles of success, and is nowhere more clearly shown than in the locating of machinery.

In contra-distinction to the above class of shops, I would say that it gave me great pleasure to go through a large furniture factory not long since, upon the invitation of the superintendent, with whom I am well acquainted, and know that his great hobby is system. The machinery was so arranged that the lumber went in at one end and door, and out the other, almost as quickly as the boy who went through college in the same manner, with this difference, the lumber showed the results of "going through" by being a finished piece of work. It first went to the cut-off saw, thence to the ripping saw, then through the planing machine, afterwards to the jointing machine, band saw, scroll saw, or sand papering machine, as occasion demanded, but no unnecessary stops were taken, and there was no going back. Once started it went like clockwork, smoothly and without friction. The same organized system extended, as a matter of course to all the different departments, and I can assure that any visitor to that factory will be favorably impressed with the *modus operandi*, no matter if he doesn't know a tenoning machine, from a corn sheller. He will leave the premises with the impression that the brain having in charge the mechanical part of the work, understands the value of a *system* of locating machinery.

Not long since the writer had a part in supplying a factory that had been run on the good old hap-hazard plan, with some new machinery as it was being enlarged. An efficient mechanic who makes such things his special business, was employed to arrange and set the new works.

Look the situation over carefully, he began to dispose of the different machines in such a manner that they would do the most good, but after about two-thirds had been so arranged the owner came into the building and the new order of things was so entirely at variance with the old, that he ordered them changed. Expostulations and explanations were in vain; he must have them something like what they had been for the past fifteen years. The expert would not submit and he left. Well the machines were all re-arranged and two of them were so close together that the men could not work, and Mr. Owner ordered two feet to be *sawn* off a rip saw table before he would acknowledge his error, it then had to be moved and patched up before it could be used at all. Not long since this same factory caught fire by reason of their not having the exhaust fan properly put up, entailing a loss of several thousand dollars. This severe loss was caused by ignorance and obstinacy; hard words but true.

Machines are often required to be placed at right angles, or even at any angle to the line shaft for a matter of convenience, etc. This can easily be performed with the aid of a "mule pulley stand," a mechanical device but *little* known. It is far better for all ordinary purposes than bevel gears, and can be used to transmit power to almost any angle within the same plane or nearly so. It consists of a standard or column suspended from the ceiling at any point suitable to turn the belt. It is provided with two idle pulleys revolving on stems which are adjustable in any direction; it receives the belt from the line shaft and turns it round the corner to the countershaft at any angle; it is simple, reliable and noiseless and promises to take the place of many beval gears. The first cost is much less than that of gears and it is easily put up by anyone.

Belt carriers are also a useful appliance for the transmission of power from one side of the shop to the other. They can be placed midway between the delivering and receiving point, and hold the belt up out of the way—in other words, take up all unnecessary "sag." They are made with a column hanging down from the ceiling and have two pulleys for upper and lower side of the belt revolving on spindles at right angles to the column or stand; they are also adjustable in any direction, thereby allowing the leading or direction of a belt, and they also save a long belt from excessive strain.

Indeed mechanical appliances for transmitting power in any direction are so numerous and varied, that with a little good judgment there is no valid reason why the art of setting up and locating machinery should not be thoroughly executed and machines conveniently arranged.

THE TIMBER TRADE IN QUEBEC.

THE annual timber circular of Messrs. J. B. Forsyth & Co., Quebec, has been published, and is as usual replete with information and statistics of very great value to the trade. In speaking of the present condition of the lumber trade Forsyth & Co. regret not being able to record much improvement either in an increased demand or an advance in prices. Regarding the markets in Great Britian, it is pointed out that although more hopeful accounts are occasionally heard, the figures of recent sales quoted show plainly these expectations have not as yet been realized. In tonnage an increase is noted in ocean steamships of 83,428 tons over last season. This increase will effect trade more in Montreal than Quebec, the former being the port of destination. There has been a considerable decline in the number of sailing vessels, especially in those lumber laden and cleared for sea. The arrivals from the lower provinces are as usual on the increase.

The total supply of timber and deals has been very moderate, much below the average of the past five years, the shipments very light and the stock wintering fully up to the present average, if pine deals are excepted.

The supply of white pine, waney board, has been slightly in excess of last year, and the quantity now on hand nearly 700,000 feet more. The returns rendered to the Custom House do not discriminate as they should between square and waney, hence our export returns are wanting in this particular; the total shipment however of white pine shows a falling off this year of 2,223,480 feet. Choice waney has been in fair request all season; during the autumn prices stiffened and nearly every good lot now in stock, or to arrive early next spring, is controlled by the shippers. The slightly improved tone in the accounts from Great Britain, as well as the knowledge that this winter's production must be far short of previous years, are no doubt the chief reasons which have prompted buyers. It is a well-established fact that several of the heaviest operators are not manufacturing this season. It is also stated that old waney has been entirely neglected, the heavy losses entailed in dressing, causing it to be most difficult to dispose of. Consequently the present stock contains a large quantity of this wood unsold, which has been lying over in the coves for two years or more.

The supply of square has been light, and the quantity now in the booms very slightly reduced from what it was last year. The manufacture is likely to be exceedingly small, and it is most desirable that it should be, for with the exception of a limited demand for square board-wood and deck-plank, other foreign woods are now extensively used, where at one time, white pine only was consumed. Nor can this be surprising to any person in the trade when we read in Messrs. Edmiston and Mitchell's circular of the 30th November last, that pitch pine of good quality 100 feet average, has been sold at 1s. to 1s 1d. per foot according to quality. The new and increasing development of sawn pine for longitudinals has also materially curtailed the demand for common grades.

Few transactions occurred until about mid-summer when sales were effected, but towards the close of the season fresh wood, especially choice lots, were moved off without much difficulty at fair rates, and our market closed firm with a shade of an advance. Our stock contains many old rafts still on manufacturer's account as well as some small common wood for which there is but scant enquiry.

The quantity of Red Pine now wintering here is unprecedently light, owing to the diminished stock from 1885 and the small production last winter. The uncertainty of the demand is largely due the great depression in the Irish markets, which at one time absorbed this wood extensively.

Oak was rather difficult to place this year until the autumn, when a considerable number of sales were effected. The figures of supply and export are almost identical, about half a million feet under that of last season and the stock on hand slightly less.

The supply of elm has been light, the export about one half of what it was last season, and the stock heavier than it was supposed it would be. This wood has been dull of sale all season.

The supply and export of ash and birch have been limited. While the stock of the former is very light, and that of birch is heavier than usual.

Staves are depressed and there is little demand.

Under the head of pine deals, Messrs. Forsyth & Co., say:

"There is a slight diminution in supply, export and stock wintering from last year's figures. This class of goods has been in fair request and held its own in prices during the season and we see no reason to fear that a reduction will take place; on the contrary, with an improvement in high class timber and a better feeling in the United States for lumber of choice quality, we may hope for better prices. It is, we think, evident that the import to this market of Michigan deals will next season be trifling if any. The shipments from Montrea continue to be heavy."

Under spruce:—"There has been during the last season a diminished shipping demand, resulting in the wintering stock exceeding that of last year by fifty per cent. In view of the heavy stock we would strongly caution our mill men against an over supply; this we are satisfied is the only line of action, and should a better feeling be developed in the trade of Great Britain, the value of this article next season may be enhanced."

Sawn lumber has been in fair demand, prices have ruled at $7 to $15 per 1000 feet b. m. for pine according to quality, and $5.50 to $10.50 for spruce. The shipments to South America have been heavy, to the Argentine Republic along it is estimated that nearly forty million feet b. m. of pine and spruce have been delivered from all Canadian Atlantic ports.—*Quebec Chronicle.*

Steamship Lines to Be Swallowed by the Great Railway Companies.

This seems to be the way things are going now. The great Inman line of steamers went into liquidation recently, and the International Navigation Company has made an offer to purchase the vessels and good will of the company. The first move in this scheme was made by Clement A. Griscom two years ago, when he advanced to the Inman Line money on about $1,500,000 of debenture bonds then out. Soon afterward the agency of the Inman Line was transferred to Peter Wright's Sons, principal owners of the International Navigation Company. Later the Pennsylvania Railroad purchased the controlling interest in the International Company. There seems to be no doubt that the Pennsylvania Railroad and the Standard Oil Company will secure the ownership of the Inman Line. It is reported also that they wish to purchase the *Arizona* and the *Alaska*, now running on the Guion Line. The Inman Line has been in an embarrassed condition for some time. John Birely, the millionaire Manchester cotton spinner, owns the majority of the stock. The above reports, says the Boston *Manufacturer's Gazette*, appear in our New York exchanges, and, though not yet fully confirmed, are believed to be reliable.

Common lumber is worth $14 to $15 a thousand f. o. b. at Kewatin, and $17.50 to $18.50 at Winnipeg. Logging operations in both the Lake of the Woods and Lake Winnipeg district will be active this winter.

WANTED.

The publisher of the CANADA LUMBERMAN desires thoroughly reliable and competent correspondents at the following named places:—

Kingston, Ontario.
Quebec City, Quebec.
St. John, New Brunswick.
Halifax, Nova Scotia.
Winnipeg, Manitoba.
Victoria, British Columbia.

The duty of each correspondent will be to give a review of his local market for the month preceding the date of issue, and the ruling quotations for different kinds of lumber, &c. For terms and any other information, address

A. G. MORTIMER,
Peterborough, Ont.

Market Reports.

MONTREAL LUMBER MARKET.

From Our Own Correspondent.

MONTREAL, Dec. 27.—As usual at this season of the year, the lumber market presents a quiet aspect, the demand having fallen off considerably. Business, however, under the circumstances has been good, and shows an increase of about 25 per cent. over December of last year, but a slight decrease as compared with November of this year. There are no changes to report in quotations, nor anything special to note in the market. The storage ground alongside the docks of the Lachine Canal just now is pretty well stocked with lumber belonging to various dealers for city consumption, and for early export in the spring.

The Liverpool timber circular of Messrs. Alfred Dobell & Co., dated December 1st says: "We have had another month of moderate imports, which has enabled merchants to deal with their yarded stocks. With the exception of three, perhaps four vessels, the import from Quebec is over, and we do not on the whole consider that it has been a satisfactory season. Shippers as a rule have wisely refrained from burdening our market with consignments of timber, and it is to be regretted that the same restraint was not exercised in the case of manufactured lumber."

The following are the quotations at the yards here:—

Forsyth & Co's annual timber circular just issued by the Quebec *Chronicle* reports a falling off of 2,223,480 feet in the export of white pine from Quebec last season, of half a million feet in the export of oak, a limited export of ash, birch and red pine, and about half the usual export of elm. Of the stocks wintering there, it says there are about 700,000 feet more of waney white pine than last year, while the supply of square white pine shows a slight reduction, but this fact coupled with the prospect of a very small manufacture this winter is most desirable, as there is but a limited demand now for this wood, owing to the more general use of cheaper foreign wood, especially pitch pine for the same purposes. The stocks on hand, both of waney and square, contain many old rafts, which have been waiting sale for some years, as well as some small common wood, for which there is but scant enquiry. Under the head of pine deals, the circular says there is a slight diminution in supply, owing to the diminished shipping demand last season. The wintering stock of spruce deals exceeds that of last year by 50 per cent, and in view of this heavy stock, mill men are strongly cautioned against manufacturing an over supply, as this is the only safe policy, and the value of these goods next season may be enhanced should a better feeling be developed in the British trade.

QUEBEC STOCKS.

The following is a tabular statement of Quebec stocks on December 1st, 1884-5-6, and also the average on the same date from 1881 to 1885 inclusive.

DESCRIPTION.		STOCK.			
		1884.	1885.	1886.	Avge. of 5 yrs. 1881 to 1885.

QUEBEC.

The shipping season here is now closed, the ss. Grassbrook being the last vessel outward, 26th inst.

During the season the total arrivals from sea numbered 432, or a shortage of 70 vessels and 55,191 tons as compared with last year. The steamships, however, show an increase over last year, being 43, or 83,428 tons, over and above the number of steamship arrivals last season.

It is announced that the Inter-colonial Railway have chartered the steamer Relief to run a a winter ferry between their station at Levis and the Canadian Pacific Railway at Quebec. If this is so, it will be a great help to the city of Quebec, and be the first step towards connecting the interests of the Inter-colonial and Canadian Pacific Railways, which it is hoped will soon be seen in conjunction by the building of a bridge over the St. Lawrence at Cape Rouge.

Lumbering operations are going on quite satisfactorily. The weather has been just the kind required, cold, with but little snow. If this weather continues logging operations will soon be over, as large gangs were sent into the woods early in order to take advantage of the long days.

With reference to spruce operations, about the usual quantity of logs will be manufactured. Spruce operations generally commence later than pine, consequently very little work has been done in the spruce camps as yet.

Market.—Timber and deals.—No sales of timber have been reported this week, but it is rumored that Wm. Little, of Three Rivers, has sold his '86 cut of pine deals. Terms and prices not transpired.

From all we can learn the lumber business at this port has again been unprofitable to all concerned. From year to year those engaged in this trade have been depending upon some improvement, but so far it has been attended only by disappointment. Last Fall our square timber manufacturers were inclined to hold their wood at very firm prices, but the business on the other side during the winter showed that there was no justification for this action on their part, as our shipping merchants had to face very dull times in making their contracts, and neither in volume nor in the prices realized was the business satisfactory. Oak was very dull of sale, and the same may be said of White Pine, with which Pitch Pine from the Southern Ports is now said to interfere very much. Elm, Birch and all Hardwoods were dull. This state of things was reflected on this side during the summer, and there were few transactions in the sale of timber except for small shipping parcels between merchants. In July we noted the sale of an old raft of 1882 timber containing small Waney and square Pine of about 44 feet at 16 cts., and a choice Kippewa raft of 53 feet with a small portion of Waney Board 21 inch at 25 cents. During mid-summer a more than usual dulness prevailed, and it was not till the latter part of October that any little animation was shown, several rafts having changed hands at that time, some choice lots of 55 to 60 feet selling at 25 cts. to 27 cts., according to quantity and size of Waney contained in each raft, as well as to quality of timber. Since that time lumbermen have been pressing sales a little, and a few choice rafts of White Pine changed hands at an advance in price. From all we can learn there is nothing in the Home markets to cause any great advance in price on this side, and the purchases that have been made here are doubtless with the object only of providing against possible winter sales. Oak also was more largely dealt in late in the fall, probably for the reason that the supply is going to be so curtailed, and also that there is now a difficulty in obtaining the large fine wood that we used to get in such quantities some years ago. The probable production this winter will not be a million feet; the stock both here and in England is much lighter than usual, so that for this wood there is probably a better outlook than for any other kind. Pine deals have been in fair demand during the season at about last year's prices, but Spruce deals have been exceedingly dull of sale. The season closed in Great Britain in the gloomiest possible manner, and with several failures occurring to add to the general uneasiness.

The quantity of both Waney and square White Pine to be manufactured this winter will be much less than last year, and the same may be said of Elm and all other Hardwoods, including Birch of which hardly any will be made this winter as the manufacturers last year all lost money. Of Red Pine there is scarcely any in stock and the manufacturers only intend filling orders that have been contracted for for next season's delivery. Most of the manufacturers in the Ottawa district are turning their attention to Saw-Logs in preference to square timber. Very few staves came down this season, and our stave trade seems to be going to Southern Ports, as we hear of none being manufactured for the coming season.

Much inconvenience was caused to local mill men during the summer by the want of rain to float down their logs, and the manufacture of Spruce deals was in consequence very much curtailed. The season closes, we are sorry to say, with no very bright outlook for the future, and a recent suspension here, as well as similar events in Great Britain serve to add anxiety and disquietude to the general depression.—*Chronicle.*

TORONTO.

From Our Own Correspondent.

In regard to the markets here at present not much can be said. We are now into the holidays and trade is consequently quiet. Building operations have been carried on up to the present time, and the prospects are that as soon as the holidays are over building will begin again, and there is every indication that quite as much building will be done during the year coming as in the year past. Prices will continue to rule about the same as at present. Bill stuff will certainly be in demand, and there must soon be a rise in prices of long bill stuff. It looks as if dry lumber would be scarce in the spring, especially in the better grades. Altogether the prospects are good for next year's business, unless the manufacturers should overdo it by excessive stocking.

BAY CITY AND EAST SAGINAW.

The Sage mill at West Bay City manufactured 30,000 000 feet of lumber this year.

A. & E Wilson, of East Saginaw, will carry over 2,500,000 of lumber at St Ignace.

C. L. Grant & Co., East Saginaw, manufactured 5,000 000 feet of lumber the past season.

The mill of C. & E. Ten Eyck, East Saginaw, manufactured 19,547,750 shingles the past season.

The amount of sold lumber on the Saginaw river is larger than manufacturers have supposed.

Reported that Mosher & Fisher paid $107,000 for 20,000 000 feet of timber they purchased in Clare County.

E. R. Poinney, of East Saginaw, manufactured 6 000,000 shingles the past season and carries none over.

Green & Stevens, Bay City, cut about 15,000,000 feet of lumber this last season at their mill on Stone Island.

The N. & A. Bernard Lumber company, Saginaw manufactured 3,500,000 of hemlock lumber the past season.

The annual exhibit of the amount of the lumber and other forest products shipped by water from the ports of Bay City and East Saginaw during 1886, show that the total amount of lumber shipped during the year is less by 71,810 000 feet than the output in 1885, and is the smallest since 1878. The cause of the falling off, says the *Lumberman's Gazette*, is in part the lesser production of the river, but perhaps more is due to the increase of shipments by rail, which now amount to about 15 per cent. of the cut. The advance in freights in the latter months of the season no doubt had some effect in retarding shipments. Then there was a scarcity of tonnage after the rise took place, and as the shipping did not begin until May 1, the season was shorter than usual. The output of shingles was also smaller than in any year since 1876. Freight rates were much higher during 1886 than in 1885; indeed equal rates have not been reached for several years. Rates opened at $1.50 from Bay City and $1.62½ from Saginaw to Buffalo and Tonawanda and $1.25@1.37½ to Cleveland and other ports. About the 1st of September an advance of 25 cents was made and later more was added and closing rates were $2.75@2 87½ to Buffalo and Tonawanda and $2@2.25 to Ohio ports.

The *Lumberman's Gazette* of the 22nd Dec. says:—Actual transactions in lumber during the past week have been very few in number, although there has been considerable inquiry about stock and prices by letter. Manufacturers here have settled down to the fact that there will be very few sales until after the holiday season shall have passed. There is no indication of any prospective change in prices, and the probability is that present quotations will rule for the opening of operations for the season of 1887, and that the season will be fairly brisk and satisfactory. The opinion exists that the stock on the river will be very materially reduced before the opening of navigation by rail shipments, which are visibly on the increase and which it is thought will be larger next season than they have ever been heretofore for several reasons which might be named, but the principal one of which is said to be the action of the Buffalo and Tonawanda lumber men, who resolved at their last meeting to purchase no more lumber on the Saginaw river by straight measure. It is claimed by some of the heaviest operators here that this action will induce more shipments by rail to its final destination, and that this business will be more sought after in the future, unless the action of the lumbermen alluded to is reconsidered and rescinded. Whether such a result will be accomplished or not is a question which time alone can settle.

Mill owners here who have the timber are hustling in their stock for next season with all possible despatch and indications point strongly to the fact that the cut of 1887 will fully equal that of 1886.

The quotations published below give the outside figures on inspected lots and there is considerable lumber on the docks and in sight, which is held at from $21 to $25 straight, although there is abundance at lower figures:—

CHICAGO.

Predictions which have been made along back, to the effect that the new year would open with fully 75,000,000 feet less lumber on hand in Chicago then was held at the beginning of 1886, seem likely to be more than realized. The report of the secretary of the Lumberman's Exchange for December, which has just been issued, makes the decrease from last year of the amount in pile, 72 972,763 feet, the totals being 608,416,940 feet for 1886, and 681,389 703 feet for 1885. There is also on hand 34,807,477 feet in the yards at South Chicago, against 53,911,525 feet that was held last year, which, as that district is really a part of the Chicago market, ought to be included in the stock at this point. Adding these figures, the totals become 643 224,417 for 1886, and 735,301 228 feet for 1885. This raises the shortage as compared with last year to 92,076,811 feet, which it must be admitted, even by those who can see no pronounced scarcity of lumber anywhere, to be a very respectable quantity. There is every reason to suppose that the difference is increasing, as the receipts have fallen off this month, while the probability is that shipments and the local consumption have been on a rather larger scale. It is likely now that the supply in pile at this will, by the close of the month, show more than the 75,000,000 deficit predicted, and, including the South Chicago, the shortage will probably overrun 100,000,000 feet. The shingle stock has increased during the month, which fact is more likely due to diminished sales than increased receipts. The lath supply shows a diminution that is remarkable, the shortage having more than doubled during November. At this rate of decrease it would not take long to run many yards out of this stock altogether. Between Dec. 1, 1885, and April 1, 1886, the quantity of lath on hand declined about 57,000 000 pieces. A similar decrease the present winter would not leave lath enough in market to give half a dozen yards a decent stock. Take it altogether, the December statement shows that the local trade is full warranted in maintaining a firm front in respect to prices, and will be justified later in making a liberal advance.—*Timberman*

LONDON, ENG.

We take the following extract from a London contemporary: The state of trade, though on the whole progresing favorably, still vacillates a good deal, and while one manufacturer acknowledges improving business, another will tell you he never knew it so bad. In the timber trade the waiting game seems still in favour, both abroad and at home. Neither side likes to be very demonstrate, but both are ready to negotiate if, literally, the ice were broken between them.

During the last few days some activity in buying from the docks appear to have been displayed by London merchants, as we learn that several parcels have changed hands by private contract, thus indicating that buyers do not entirely trust to the public sales. In these cases we believe sellers have obtained the prices at which they intended to hold the goods for some time.

We are glad to note that the advices received from the north-eastern shipbuilding centres continue to read encouragingly. From Sunderland, for instance, a port where the depression of trade has, perhaps, been more severely felt than in most other places, further improvement is discernable both in the shipbuilding yards and engineering works. Additional repairing contracts have been concluded and new steamships are being laid down, while the ironworks and forges are reported to be better supplied with orders than has been the case for many months.

MIRAMICHI AND DALHOUSIE SHIPMENTS.

The shipments of deals, timber, &c., from Miramichi and Dalhousie for the season just closed were as follows:—

Messrs. R. A. & J. Stewart shipped also 203,000 staves.

Mr. Hy. O'Leary shipped also 230,000 laths.

BLACK BIRCH.

The price of black birch of best quality has recently gone up from $7 to $95 per 1,000. The extraordinary advance is due to the discovery that boards cut out of the first logs are susceptible of a very high polish, and can be used for almost any purpose hitherto exclusively reserved for mahogany, which is worth about $250 a thousand. The advance has been expedited by the discovery that the best black walnut is giving out. Black walnut from Arkansas and the south is so porus that it is of very little use in furniture making. The best is black birch found almost exclusively on the barren copper ore regions between Milwaukee and Ashland, where all other timber is stunted in growth and very poor. Here boards out of the butt cut quickly assume a beautiful red tint on being exposed to the atmosphere, and can be polished up to a great degree of fineness. The price will soon fall to $50 or $60 a thousand, as a railroad is being laid right through the very inaccessible region where it grows, and the high prices have tempted several men to open out saw-mills. Red beach has also advanced in price very rapidly. It could be bought up recently in Indiana and Ohio for the bare cost of sawing, but now it is worth $30 a thousand.—*Lumberman's Gazette.*

The wood-working establishment of Messrs. Wm. Cane & Sons, Newmarket, had a narrow escape from complete destruction by fire on Dec. 14th. It will be remembered that this firm sustained a very heavy loss by fire a couple of years ago.

Correspondence.

To the Editor of the Canada Lumberman.

Would you or some of your readers enlighten me regarding a question which is of considerable interest to owners of water-power saws mills and others? I have often heard my father say that he had often noticed the fact that a water mill would run much stronger at night with the same head of water than in the day. For many years he was an engineer in a paper mill when the same machinery was used continnously day and night to grind paper pulp. This would seem to me a fair and conclusive condition as not subject to the fluctuations and interruptions as in a saw mill. He said the mill ran more evenly, or steadily, stronger, and with more revolutions than in the day. He did not know the cause but attributed it to the atmosphere.

W. B. A.

[We shall be pleased to receive a solution of this problem from any of our readers, which will be given in the next issue of the LUMBERMAN.—ED.]

WHITEMOUTH, Man., Dec. 22nd, 1886.

To the Editor of the Canada Lumberman.

Below you will find a list of the quantities of the various kinds of timber to be cut in the woods about Whitemouth, this winter, on the C. P. R. east of Winnipeg:

G. W. Streovel, 300,000 ties; J. G. Dennison & Co., for C.P. R., 100,000 ties; William Skead & Co., for C.P.R., 100,000 ties; Mr. Ferguson, for C.P.R., 60,000 ties; McRissly & Co., for C.P.R., 20,000 ties; Gibbons & Livingstone, 20,000 ties; David Ross. 3,000,000 feet of logs; P. Enwright, wood king of Winnipeg, 4,000 to 8,000 cords; A. C. Smith, 3,000 cords wood; McRissly & Co., 3,000 cords wood; Mr. Hargrieve, 2,000 cords wood; Mr. Goodenhue, 2,000 cords wood; besides many other small operations.

The above will show your readers that Manitoba is not yet *dead*. The wages in the ties camps is from $20 to $45; in log camps, $20 to $26 and board. In wood camps workmen make from 80 cents to $1 per cord for cutting, and pay $4 per week for board.

Working men are in good spirits, as their pay is good, and the weather excellent for working.

LUMBERMAN.

MADAWASKA, N. B., Dec. 22nd, 1886.

To the Editor of the Canada Lumberman.

Lumbermen so far have had a beautiful season and the output will exceed that of last year, unless deep snow sets in, which seems to threaten now, as we already have two feet in the woods. The estimated cut is 7,000,000 feet from the mouth of Tobique to Victoria, up to Grand River, Madawaska, and from that point to St. Francis about 2,000,000 more.

On the American side, Messrs. Couliff, Conners, Stephens, Eatons, Dickley and others, are doing a heavy business, and owing to our export duty not being enforced here in Madawaska, Americans are yearly manufacturing forty million shingles, besides other lumber taken out of our forests. In this case our National Policy is giving Americans a premium of the import duty, to slaughter our forests and allow our local mills to lie idle. Holmes & Hammond are now building shingle mills to increase the slaughter, so that in a few years our stocks will be *nil*.

Our enterprising townsman, Mr. G. V. Hammond, is doing a heavy business in spruce logs, sleepers and shingles, but our staple article is lumber, and so long as the Dominion Government pursues a policy to encourage American citizens to slaughter it, it is poor encouragement for a New Brunswicker to invest his money, and try to build up his country out of it.

P. O. BYBAM.

OTTAWA, Dec. 26th, 1886.

To the Editor of the Canada Lumberman.

While wishing you the compliments of the season, I must also congratulate you on the marked improvement you have already made in your paper—THE CANADA LUMBERMAN. So far as my knowledge goes, lumbermen in the past have been of the opinion that the paper was not up to the mark, and if you will pardon a plain expression, not worthy of the extensive industry it claimed to represent. Of late, however, I have heard many of our leading lumbermen speak very highly of the efforts you are making towards supplying the trade with a first-class journal, and I am safe in saying that one and all will give it a hearty support.

There is one important matter to which I desire to call attention, and that is the little interest manifested by the general reader in regard to correspondence. We, as lumbermen, like all other representative business men, have our grievances. Sometimes they are against the Government, sometimes against the railways, and sometimes against the general public, and unless these grievances are brought to light and discussed through the medium of the press, how can we ever expect to have our wrongs redressed? Now, Mr. Editor, I know that at the present time lumbermen have grievances of paramount importance, and through the existence of such, a very large amount of money is being annually lost to the trade. It is of personal interest to every man to adopt some means to protect his business from loss, and my suggestion is that all matters of this nature should be discussed, *pro* and *con* through the columns of the LUMBERMAN.

In addition to this there are many other matters pertinent to the manufacture and sale of lumber, which might well be taken up in this way, and I hope that the many intelligent and thinking men who are engaged in this business, will devote an hour now and again to the work of putting their ideas on paper, and by so doing not only benefit themselves individually, but the trade in general.

I have written this, Mr. Editor, simply as an introduction, and will in a future issue endeavour to give you something calculated to stir up the dry bones, as it were, and bring forth discussion.

Hoping that the next issue of the LUMBERMAN may contain many letters of interest.

Yours truly,

CHIP.

GRAVENHURST, Dec. 10th, 1886.

To the Editor of the Canada Lumberman.

The mills here and in the vicinity have all shut down, mainly owing to the frost, but a considerable number of logs are held for spring operations. It may not be uninteresting to give you a short statement of the mills here.

G. W. Taylor & Co's. gang mill, cut about seven million feet of lumber for the Ontario Lumber Co. Joseph Tuers single circular mill, cut one and one-half million lumber and one million of shingles for Mr. J. Collins, of Bracebridge, and three million of shingles for Thomson & Baker of this place.

McBurney & Co. (one circular mill) cut about five million feet of lumber and two million of lath. Chas. Mickles three mills (each one circular) cut ten millions ft. lumber, five millions shingles, and about three millions laths. Isaac Cockburn's (two circular mill) cut about five millions feet lumber, five millions shingles, and two million of lath. J. H. Hull's shingle mill cut nine millions of shingles with 3 machines. Thomson & Baker (one circular mill) cut 4½ million lumber, 3½ million shingles and two million of lath. L. B. Hill's shingle mill cut about two millions of shingles. Thomas B. Tait's shingle mill (2 machines) cut nearly eight millions of shingles; and James King's (one circular mill) cut about one million ft. lumber and two millions of shingles. This I believe covers the mills in the town.

In the vicinity James Harvey's mill in Draper, cut about three millions lumber and three millions shingles. Tasker's mill at Reay, also in Draper, cut one and a-half millions lumbum and one and a half millions shingles. H. De Blaquen's mill, just nicely started, has cut about a million of shingles, and will run on bill stuff and shingles all winter. J. H. Hull's mill, (one circular) at Lethbridge, cut about two millions of lumber and one million shingles and lath. J. I. Clark's mill, also at Lethbridge, has cut three and a quarter millions shingles. At Bracebridge, Brown & Sheers mill cut about five millions shingles and half million lumber; and Leishman & Perry's mill about one million lumber and a lot of shingles. Besides the above there is shipped from here several millions of lumber and shingles, cut in mills round Lakes Muskoka, Joseph and Rosseau. The year has been a successful one. The stocks cut by the different mills are all sold, and about half shipped. No dry lumber can be got here next year if the shipping goes on all winter as briskly as now. No large stock of shingles except Mr. Thomas B. Tait's is held here.

All in the trade are hopeful for good demand and a small advance next year.

Large stocks are being got out in the woods and are all well on with the work.

Wages in the woods are ten per cent. higher than last year. The prices of logs on the river is twenty per cent. higher than last year, six dollars being freely paid now for extra logs.

The old De Blaqueur mill will be run by Thos. Tait this year he having purchased same.

Thomson & Baker intend putting in a band saw in there mill here.

Sheers has purchased the interest of Mr. Brown, his partner in the Bracebridge South River mill, and Mr. Leishman has purchased the interest of his partner, Mr. Perry, in the north river mill.

I. J. McNeil has purchased a berth in Bethune from Mr. T. Maxwell, paying, we understand, $16,000 for same.

Mr. Hugh Brown, of Utterson, has purchased the limits in the Township of Stephenson, from the Bank of Toronto, for $2,000.

Several small transactions in timber lots at large prices are reported.

Mr. Waldie, the purchaser of the Victoria harbor limit from Mr. Power of Barrie, was up getting himself initiated into the mysteries of log cutting and shanty life. A little bush life won't do him any harm. He is putting in a band saw in the mill at Victoria Harbor. We wish him success.

A correspondent wishes to know if any one can give him a statement of the case of Dyment vs. Thomson and the principle involved of interest to the trade.

Yours truly,

FRANCIS BAKER.

FROM THE LUMBER REGIONS.

MINNEAPOLIS, Minn., Dec. 1.—The saw-mills have closed down after having the shortest season on record, being one month to six weeks less than last year. As a result, 50,000,000 feet more lumber was sawed in 1885 than during the past season. This season the total cut of lumber was 262,636,019 feet; of shingles, 80,925,000 feet; of lath, 55,264,800 feet. In 1885 the cut of lumber was 313,998,166 feet; shingles, 101,857,750 feet; lath, 82,175,817 feet; the decrease is 51,362,147 feet of lumber. 20,932,750 feet of shingle, and 26,911,017 feet of lath. The Surveyor-General's scale shows that 237,891,540 feet of logs were turned through the boom during the year. This is 51,000,000 less than last year; and it is due to the delay in the beginning of the season. In 1885 79,503,520 feet had been turned through the boom up to July. In 1886 but 30,968,730 feet had been run through up to that time. There are now 12,000,000 feet of logs in the mill ponds and 10,000,000 feet in the booms. Above Sauk Rapids there are about 11,000,000 feet. It is not probable that the mills will be enabled to commence operations any earlier next season, but they will have plenty of logs when they start up, and the cut will be largely increased. It is estimated that the stocks in the lumber yards amount to 175,000,000 feet, against 264,500,000 in 1885.

EAST SAGINAW, Mich.. Dec. 1.—For several months past lumber dealers and mill men of the Saginaw Valley have been busy arranging a scheme which promises to work a revolution in the lumber business of the West. The scheme is to make the Saginaw Valley the great central distributing point of assorted lumber. Since the infancy of the industry here the practice has been to pile on the docks the cut of the mills without sorting, thus giving a great profit to the middlemen. Sold in the rough it was finished in the planing-mills of the purchasers, who thus reaped a large profit that was lost to the capital and labor of the valley. This profit amounted to hundreds of thousands of dollars, and to keep this money in the valley has been an object long aimed at, and led to the establishment in the last five years of sorting yards and planing mills. The project has for its object the purchase of the entire cut of the valley; to be stored in and sold from the sorting yards here.

THE MANUFACTURE OF CANOES.

In Eastern Canada row boats are not in popular favor, the majority of people who paddle our rivers and small lakes either for pleasure or business, preferring the light canoe rather than the more burdensome article just mentioned. We had the pleasure a few days ago of visiting the works of the Ontario Canoe Co., situated in the village of Ashburnham, directly across the river from the town of Peterborough. We were kindly received by the managing director, Mr. J. Z. Rogers, and conducted through the different buildings belonging to this company. On enquiry we found that the main factory was 30x65 feet in size, four stories high, adjoining which is another building, two stories high, in which is contained the offices of the company and storage rooms for the product of the factory. Another building, larger than any of the others, is also utilized for a show room. Here we find almost every variety of canoe, with and without rigging, arranged conspicuously so as to represent them as they appear in the water.

The models used by this firm are noted for their beauty and speed. They carry good wide bearings, and carry them well forward, but not so as to interfere with their speed. All canoes undergo a practical test before leaving the works, and nothing but the best material which can be procured, is used in their construction. During our visit to the works we were shown an open cedar rib canoe, built last year, which weighs 12½ pounds, complete with decks and thwarts, capable of carrying 450 pounds. It is a beauty, and is an indication of what can be accomplished by Canadian boat builders. Nearly two hundred different kinds and sizes of canoes are built, enough surely to satisfy the tastes of the most scrupulous. This company were awarded a silver medal at the Antwerp exhibition, and at every other point where they were shown a prize was given. At the present time the works are running to their fullest capacity, filling orders, principally for the English market.

MEN OF 24,000 YEARS AGO.

If the claims of old descent were a justifiable source of pride, the human race would feel elated this morning on being assured by the wise men of the British Association that authentic proof had been discovered in some Welsh caves, that men, sufficiently developed from the ape to manufacture flint implements, existed on this planet 240,000 years ago. To us it is a melancholy reflection that we should have taken so prodigious a time to attain so small a result. Even when the duration of the race is limited to the six thousand years of history, the outcome can hardly be considered as satisfactory, and there is something profoundly depressing in the sudden addition of a series of ancestors who spent 234,000 years in marking time, indeed, but in making no other mark in the world.—*Pall Mall Gazette.*

The Customs authorities have refused to grant the application made by Detroit residents to be allowed to tow pine logs in rafts to the Canadian side of the Detroit river, and remove them in such quantities as may from time to time be required.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh. Out of 2,000 patients treated during the past six months, fully ninety per cent, have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is pratically cured, and the permanency is unquestioned, as cures effected by him four years ago cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west. Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.*

Another result of the construction of the C. P. R. railway is the commencement of a lumber trade from British Columbia. The first car-load left New Westminster the 22nd November arriving in Montreal on the 9th of December and was delivered to its destination on Saturday. It contained 15.000 ft. of Douglas fir and cedar cut into 30 ft. lengths, and from enquiries made the company anticipated doing an extensive trade in lumber from British Columbia, especially where the long sill timber is required. The mills in the province are being enlarged and fitted out with the necessary machinery with the evident intention of supplying a great demand.

Notice to Contractors

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Midland Harbor Works," will be received until Tuesday, the 25th day of January, 1887, inclusively, for the construction of Works at Midland, Simcoe County, Ontario, according to a plan and specification to be seen on application to the Reeve, Midland, at the office of the Resident Engineer, Midland Division of the Grand Trunk Railway, Peterborough, and at the Department of Public Works, Ottawa, where printed forms of tender can be obtained.

Persons desirous of tendering are requested to make personal enquiry relative to the work to be done, and to examine the locality themselves, and are notified that tenders will not be considered unless made on the printed forms supplied, the blanks properly filled in, and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque made payable to the order of the Honorable the Minister of Public Works, *for the sum of one thousand dollors* ($1,000), which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works, Ottawa, 24th December, 1886. 3d153

CAPE BRETON RAILWAY.

SECTION—GRAND NARROWS TO SYDNEY.

TENDERS FOR THE WORKS of CONSTRUCTION.

SEALED TENDERS, addressed to the undersigned and endorsed "Tenders for Cape Breton Railway," will be received at this office up to noon on Wednesday the 12th day of January, 1887, for certain works of construction.

Plans and profiles will be open for inspection at the office of the Chief Engineer and General Manager of Government Railways at Ottawa, and also at the Office of the Cape Breton Railway at Port Hawkesbury, C.B., on and after the 27th day of December, 1886, when the general specifications and form of tender may be obtained upon application.

No tender will be entertained unless on one of the printed forms and all the conditions are complied with.

By order,
A. P. BRADLEY,
Secretary.

Department of Railways and Canals, Ottawa, 15th December, 1886

NOTICE.

TENDERS will be received at the Department of Inland Revenue until Noon on Monday, 3rd January, 1887, from parties desirous of leasing the privilege of ferrying across the River Ottawa, between Fitzroy, in the County of Carleton, in the Province of Ontario, and Onslow in the County of Pontiac, in the Province of Quebec, in accordance with the terms and under the conditions set forth in the Regulations copies of which can be procured from the Inland Revenue Department at Ottawa.

Each Tender must state the amount which the parties tendering is willing to pay per annum for the privilege referred to, which amount will be payable in advance, the terms of the lease being for five years from the first of May, 1887.

Each Tender must be accompanied by a cheque marked "Good" on one of the chartered Banks doing business at Ottawa, for one-half the amount of the per annum tender. This amount will be credited on account of the first year's rent in the case of the accepted tender, and all other cheques will be returned, except in the event of withdrawals, in which case no refunds will be made.

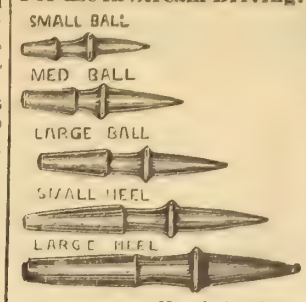
All communications must be addressed to the undersigned and endorsed on the envelope, "Tender for the Quyon Ferry."

WM. HIMSWORTH,
Secretary.

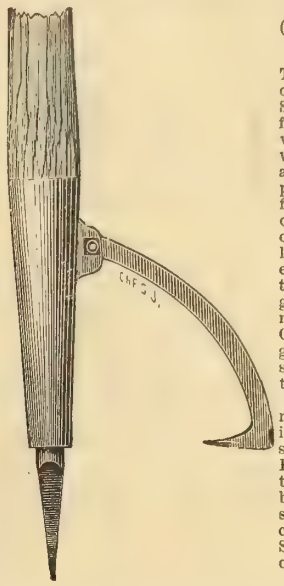
Department of Inland Revenue, Ottawa, 14th, Decebmer 1886.

LUMBER DRIVER'S CALKS,

For use in Stream Driving. Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper rendering them stronger and more durable than any other Calks. 25 in Ball and 5 in Heel are the numbers usually required. Ask for our make and take no other. See advertisement of Cant Dog.



Manufactured by
T. McAVITY & SONS, ST. JOHN, N. B.



ORONO CANT DOGS
(All Steel.)

The Dogs are made of the Best Cast Steel, by the drop forging process, which makes them very smooth, true and even. The point or hook is fashioned to a nice oval shape so as to catch all sizes of logs instantly, and enabling the operator easily to disengage. The picks are made also of Best Cast Steel and are of good length both inside and outside of the wood.

Our handles are made of best quality straight grained split and turned ROCK MAPLE, 5 to 6 feet in length, bored specially to suit the pick. Prices on application. See advertisement of Drivers Calks.

manufactured by
J. McAVITY & SONS, ST. JOHN, N. B.

NOTICE

TENDERS will be received at the Department of Inland Revenue until noon of Monday, the 3rd January 1887, from parties desirous of leasing the privilege of ferrying across the River Ottawa, between La Passe, in the Province of Quebec, and Gower Point, in the Province of Ontario, in accordance with the terms and under the conditions set forth in the Regulations, copies of which can be procured from the Inland Revenue Department at Ottawa.

Each tender must state the amount which the party tendering is willing to pay per annum for the privilege referred to, which amount will be payable in advance, the terms of the lease being for five years from the 1st May, 1887.

Each tender must be accompanied by a cheque marked "good," on one of the chartered banks doing business at Ottawa, for one-half the amount of the per annum tender. This amount will be credited on an account of the first year's rent in the case of the accepted tender, and all other cheques will be returned, except in the event of withdrawals, in which ease no refunds will be made.

All communications must be addressed to the undersigned, and endorsed on the envelope "Tender for the La Passe Ferry."

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.

General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.

MANAGER—WILLIAM SMITH.

General Offices—Court St., Toronto, Ont.

Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts, and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from misrepresentations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when n Toronto.

GRATEFUL—COMFORTING.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast table with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*"Civil Service Gazette."*

Made simply with boiling water or milk. Sold only in packets by Grocers, labelled thus:

VOL. 7. PETERBOROUGH, ONT., FEBRUARY, 1887. NO. 2.

CANADA'S LUMBER SHIPMENTS TO ENGLAND.

CHURCHILL & SIM report the following consigments of lumber, etc. from Canada during the year 1886:—

SAWN WOOD.—Pine, deals. &c., from the St. Lawrence, for 1884,1,714 000 pieces; 1885, 1 665 000 pieces; 1886, 2,072,000 pieces. Spruce Deals, &c., from the St Lawrence, for 1884, 1,971.000 pieces; 1885. 1 968,000 pieces; 1886, 1,858,000 pieces. Spruce Deals, &c, from New Brunswick, for 1884, 355,000 pieces; 1885, 510,000 pieces; 1886. 503,000 pieces.

TIMBER.—Yellow Pine from Quebec, for 1884, 3,841 loads; 1885, 6,247 loads; 1886, 2 681 loads. Red Pine from Quebec, for 1884, 1,135 loads; 1885. 797 loads; 1886. 289 loads. Elm from Quebec, for 1884, 1.999 loads; 1885 2,713 loads, 1886, 622 loads. Ash from Quebec, for 1884 4,495 loads. 1885 2,123 loads; 1886, 1,632 loads Hickory from Quebec, for 1884, 144 loads; 1885, 223 loads; 1886, 41 loads Oak frem Quebec, for 1884 2 936 loads, 1885. 3 557 loads; 1886, 3;076 loads Birch from Quebec, for 1884, 2 066 loads, 1885, 5,475 loads; 1886, 966 loads. Birch, Nova Scotian, &c., for 1884, 3,982 loads; 1885, 3,327 loads; 1886, 1,654 loads.

PINE DEALS, the most important supply from the Canadian ports, have varied little during the year. They have arrived in larger quantities than required; but, owing to firm holding, there has been no appreciable fall in value except for first quality. A favourable turn in the demand is wanted to save the market from the dangers of too large an accumulation of stock. Spruce have fallen so low that it is difficult to believe that they will be much cheaper, or that any reduction could increase the consumption.

In Timber, shipbuilding woods have been very difficult to sell, and exceedingly unprofitable; furniture woods, with the one exception of Birch, are better, the cabinet makers' trade having been far more prosperous than the builders'. A large falling off in the supply is noticeable.

FARNWORTH & JARDINE report:

YELLOW PINE TIMBER:—The import has consisted of 4 cargoes, chiefly waney pine on contract, as compared with no arrivals in the corresponding month during the past two years; the deliveries have been fair, and stocks are now lower than ever previously recorded, nevertheless quite ample for the demand, and there is improvement in values. St. John pine: Several parcels of prime quality and large average have arrived, but the demand is limited, and the bulk has gone into stock Red pine has come forward more freely; the demand is moder ate, and prices rule very low. Oak logs: The import has consisted of 16,000 feet, against *nil* during the same month last year; the stock is light, viz, 151,000 feet, against 288,000 same month last year, and 239 000 for the year before; and although there is rather more inquiry, prices have not improved. Oak planks have been imported more freely, viz., 61,000 feet, against 31,000 feet last year; the demand continues fair, and the stock, though ample (128,000 feet), is not excessive. This article is quite taking the place of oak in the log, and as shipments are now both more carefully culled and manufactured, and the cost comparatively low, it will probably still further grow in favour with our wagon builders. Elm has been more inquired for, and as the stock is light, the prices are firmer. Ash: The import has consisted of two parcels of medium quality, which have been sold at fair rates from the quay; the stock is very moderate. Pine deals: The import has consisted of 746 standards, against 456 standards same month last year; the deliveries have been unsatisfactory, viz., 1,166 standards, against 1,579 standards last year, and the stocks remaining over are excessive, viz., 9,180 standards, against 6,638 standards; sales are most difficult to effect, and prices for all qualities are lower. Quebec staves are seldom inquired for, and prices rule low.

NEW BRUNSWICK, &c., SPRUCE AND PINE DEALS.—Spruce deals have come forward much too freely, viz., 7,105 st ndards, against 5,630 standards same month last year; the demand, though fair, has not kept pace with the import, and the stock has accumulated and is now almost equal to same time last year, viz., 19,344 standards, against 21,331 in 1885; this has checked any improvement that might have been expected at this season of the year, and the prospects during the winter months is not encouraging. Pine deals are dull of sale, and prices are unchanged. Birch has been imported freely, viz., 122 000 feet, against 2,000 feet same month last year; the demand has fallen off, and late sales show a sharp decline in value; the stock remaining over is excessive, viz.. 165,000 feet, against 144,000 same month last year, and 70,000 feet in 1885. Birch planks have been imported moderately and are in fair request, but more care must be taken in the manufacture to bring this article into favour with our buyers.

PITCH PINE.—The arrivals during the month have been 1 vessel 627 tons, against 3 vessels 2 295 tons during the like time last year. The consumption, as usual at this time of the year, has been small, but it is very satisfactory to see the stock reduced to such a small compass—smaller, indeed than for several years past; this has naturally had a beneficial effect on the market, and improved prices have been paid for the season's wood. Freights are stiffening, and with a scarcity of tonnage shippers look for still further improvements in prices, though at present this is not very freely responded to on the part of importers.

A. F. & D. MACKEY, report:

PINE TIMBER.—Import from Quebec during the month, waney 79 000 cubic feet, and square 28,000 cubic feet, consumption 116,000 cubic feet, total, against 76,000 during December last year, stock remaining 110,000 cubic feet square, 194,000 feet waney, against 226,000 and 389 000 cubic feet respectively at this time last year. St. John and other ports pine, import 32,000 cubic feet, consumption 4.000 feet, against 30,000 feet, stock 73,000 cubic feet, against 82,000 feet last year. No sales to report, arrivals having been wholly on local merchants' account.

RED PINE.—Stock reduced by 1,000 cubic feet.

OAK.—We have to report a still more reduced stock, namely, 151,000 cubic feet, against 288 000 cubic feet at end of December, 1885, consumption although scarcely an average one is double the import, being 32,000 cubic feet, against 45,000 feet last year, and only 16,000 cubic feet arrived. No doubt prices slightly advanced, but very little inquiry.

OAK PLANKS.—The stock of these is still somewhat reduced, being 128,000 cubic feet, against 160,000 twelve months ago. The import which was a large one for the time of the year, was 61.000 cubic feet, against 31 000 cubic feet, and consumption 57,000 cubic feet, against 75 000 cubic feet in December, 1885, and 35,000 cubic feet for same period in 1884.

ELM.—There has been 10,000 cubic feet imported during the month, and 5,000 cubic feet gone into consumption, leaving the stock 12,000 cubic feet, against 35,000 cubic feet twelve months ago.

ASH.—A parcel of 10,000 cubic feet arrived during the month, and has gone in consumption direct. Stock 7,000 cubic feet.

BIRCH.—This wood has arrived largely, totalling 122 000 cubic feet, and this fact coupled with a consumption of 37 000 cubic feet has increased the stock to 165 000 cubic feet, which has had a bad effect on prices which had been advancing during October and November. Sales have been as follows:—1 180 logs, ex Tobique from St. John, N.B., 14½ inches average at 15½ pence per cubic foot, and 118 logs 13½ inches average, at 15 pence, 1 004 logs ex Dora from St John N.B., nearly 14 inches average at 15½ pence. 751 logs ex Kildonan from Pictou, 16 inches average at 14½ pence per cubic foot. The latter parcel being offered at auction on account of buyer, was nearly wholly withdrawn, very few bids being produced.

N. B. & N. S. SPRUCE & PINE DEALS.—The import has been large for the time of the year, namely, 7,105 standards against 2,630 standards during December, 1885. Consumption 5,500 standards against 3,150 standards, and stock 19 344 standards against 21.331 standards twelve months ago, and 26 310 standards on 31st December, 1884. No alteration in values, the demand being slow. Several cargoes offered at auction, but only a few lots sold. balance being disposed of privately.

QUEBEC DEALS.—The stock still stands at high figures, viz: 9,116 standards against 9,638 last year at this time. The arrivals during the past month although greatly reduced as compared with November are larger than an average, being 746 standards against 456 in December 1885. Consumption 1,166 standards against 1,579 standards.

PITCH PINE.—The stock has now been reduced to a very healthy limit. consisting of 95,000 cubic feet hewn timber, 161,000 cubic feet sawn and 55 000 cubic feet planks, totalling 311,000 cubic feet against a like total of 1.048 000 cubic feet at this time last year. The import has been 34 000 cubic feet of all kinds, and the consumption 140,000 cubic feet.

SKETCHES OF THE TRADE.

THE Toronto *Globe* of a recent date published a write-up of some of the leading industries located along the line of the Northern railway, in which we find the following references concerning the lumber trade:

WM. CANE & SONS' MFG., CO. (LIMITED).

The town of Newmarket owes much to her manufacturers, of whom Mr. Cane was one of the first. Mr. Cane had been the owner of a sawmill in the township of East Gwillimbury, but in 1875 he moved into Newmarket, and commenced the manufacture of lumber, lath, shingles, sash, blinds, mouldings, door, and in fact all kinds and descriptions of housebuilding materials, in addition to ordinary lumber. This business grew to large proportions, and with it grew Mr. Cane's capital, and he commenced the manufacture of all kinds of wooden ware, such as pails, tubs, washboards, and clothes pins. This business has grown also, and there are now made at the works no less than forty-two different kinds of ordinary pails. At the late Industrial Exhibition many of these were shown and a silver medal was granted for the general excellence of the exhibit. But the articles in that exhibit which attracted the most attention were the impervious wooden packages made by the firm, such as oil cans pickle packages, etc. To such perfection has the manufacture of these goods been brought by this firm, that they can make wooden packages convenient to handle which will hold any substance, no matter how volatile

or penetrating, and their oil can will hold gasoline as safely as any tank. The extent of the business may be gathered from the fact that the company employs 120 men the year round, besides woodsmen, and use over two million feet of lumber, and two thousand cords of stavebolts in the factory in the manufacture of their various products. In 1885, after ten years' successful operation, the firm was changed into an incorporated company, under the style of Wm. Cane & Sons' Mfg., Co. (Limited). The citizens of Newmarket have since they have been incorporated as a town, had but one Mayor, Mr. Wm. Cane, the head of the firm, and are not likely soon to change. This one fact is sufficieut to show that Mr Cane is not only a large employer of labor, but also an extremely popular and public-spirited man.

PHELPSTON'S INDUSTRY.

Where the thriving village of Phelpston now stands, seventeen years ago was nothing but an unbroken wilderness. About that time the firm of N. & O. J. Phelps, of St. Catharines, who had purchased a timber limit at this point, erected what is now the best and most complete circular sawmill in Northern Ontario. The building of the mill brought, of course, a large number of men who were employed by the firm, and a little village sprang up around the property. This village has become each year more and more thriving, and at the present time there are located there a number of handsome stores and spacious grain warehouses, from the latter of which an immense quantity of grain; purchased from the farmers in the neighborhood, is annually shipped to Toronto Phelpston is not on the direct line of railway to the North-west, but all its shipments have to be sent through Allandale, where the great junction of the Northern & North-western system is situated. Although the mill will have to be removed in about two years, owing to the supply of lumber being nearly exhausted, the prosperity of the village will still go on. The business enterprise of N. & O. J. Phelps has made the place, and the firm has always been deservedly popular. The sawmill has a capacity of from forty to fifty thousand feet of lumber per day, and is one of the features of the northern district of Ontario. Mr. O. J. Phelps has served one term in the Local Legislature, with credit to himself and satisfaction to his constituents, by whom he is universally esteemed. Among the benefits which have been derived from Mr. O. J. Phelps, connection with municipal matters the township of Flos, of which he was Reeve for fourteen years, has to thank him for the railway which now passes through her borders.

THE LONGFORD LUMBER COMPANY AND RAMA TIMBER TRANSPORT COMPANY.

The most important industry at Longford Mills, Township of Rama, is carried on by The Longford Lumber Company, who have two fine large steam sawmills, with a capacity of eighteen to nineteen million feet in six months. This company have very extensive limits in the townships of Rama, Digby, Dalton, Carden, and Anson, and they are also sole owners of the township of Longford, which has an extensive and abundant supply of pine, hemlock, and other valuable woods sufficient for their mills for many years to come. The output of their mills this season was eighteen and a half million feet and two million lath and about ten million of shingles. Their manufactured goods are shipped over the N. & N. W. Railway, principally to Toronto and thence by vessel to Ogdensburg, Oswego, and other lake ports. In addition to their large saw mill interest they have a fine herd of Shorthorn cattle, Southdown sheep, and Berkshire pigs This company employ in the cutting season at the mills about 150 men and in the winter season from 300 to 400 men. The next business of importance is conducted by the Rama Timber Transport Company, under the same management It was formed for the purpose of taking logs through the canal from Black River into Lake St. John, and from Lake St John to Lake Couchiching by machinery composed of a tramway about 90 rod long, operated by a large engine and boiler driving a multitude of short shafts and cog wheels with rollers attached, where logs are put on and propelled across at the rate of about 1,500 to 2,000 pieces per day. About forty men have been employed at the work for about four months in the year. There is also on their premises a large shingle mill, with a capacity of eight million in the six months, and the company also operate a magnificent farm in connection. This company has done a large business for the past few years.

North of this are the small post villages of Washago and Severn River, and then the village of Gravenhurst is reached. The description of that place and of those to the north, will, however, appear at a future date.

E. U. WHIFFEN'S MILLS

Among the best known, and most enterprising of the residents of Orillia, Mr. E. U. Whiffen deserves a prominent place. Mr. Whiffen was superintendent of Beecher & Sullivan's mills, at Bell Ewart, for many years, until in 1880, the mill was burnt down, when he moved north, and the British Canadian Lumber Co's mill, at Midland, under contract for one year, and in the year following he purchased a mill at Fesserton, the point where the Midland Railway first strikes the Georgian Bay. The mill has a capacity of from three to four million feet of lumber per annum, and is a complete circular mill with ample power. Around the mill are some of the best piling grounds in the country, well laid out, and with plenty of railway switches running through. Parry Island in the Georgian Bay, is this year furnishing the mill with its stock of lumber. A general assortment of lumber is sawn, including pine, oak, ash, spruce, tamarac, and birch. This is sold chiefly in the Canadian market, and handled chiefly by Toronto firms but some of the choisest finds a market in Oswego. The mill is about sixteen miles from Orillia, on the Midland Railway, and as it has good dockage on the Georgian Bay, there are ample facilities for shipping the products of the mill at reasonable rates. Mr. Whiffen is a native of Utica, N. Y., but has for several years past lived on Peter street in the town of Orillia.

NEW ADVERTISERS.

THE current issue of THE LUMBERMAN contains several new advertisements, to which attention is directed. The prime, first, last, and all the-time object of the advertiser is to draw custom, and patrons of this journal are no exception. The firms below referred to take a place among the most reliable business men of the Dominion, and are well and favorably known by a large majority of LUMBERMAN readers:—

JOHN C. MCLAREN.—BELTING,

292 and 294 St. James Street, Montreal, manufacturer of Oak Leather Belting and Textile Supplies, occupies a space on page 15 of this issue. A special engraving is now being made by our engravers and will be ready by the next issue. Mr. McLaren is so well known by the manufacturers of Canada that a further introduction is unnecessary. This business has been in successful operation since 1856, and is increasing in importance every year. The oak leather belting, as manufactured by this house, stands second to none in the market, and has an extensive sale in every Province of the Dominion. Every variety of textile supplies, such as card clothing, loom reeds, etc., are also manufactured in large quantities.

MONTREAL SAW WORKS

After an absence of over a year, Mr. Chas. M. Whitlaw, manager of the above works, has returned to his old love, and contracted for a space on back of cover. When THE LUMBERMAN called on this gentleman, a fortnight since, the thermometer ranging 20° below zero, we found him in close proximity to a red-hot stove and apparently enjoying all the comforts that man could desire. Business, he informed us, was fairly good, notwithstanding the fact that during the present season trade is generally very quiet among saw men. This firm manufacture all kinds and sizes of circular and cross-cut saws, and have done a large share of the trade of the country for many years past. Saw mill men and wood-workers in general who contemplate adding to their present supply of saws will find it to their advantage to correspond with this firm.

ROBIN & SADLER.—BELTING

But few firms in Montreal are better known among manufacturers than Robin & Sadler, manufacturers of Leather Belting. Having been established for many years, they have won for themselves a reputation of which they have every reason to feel proud. The belting of this firm's manufacture may be found in almost every city and town in Canada, and has given universal satisfaction. A contract was made during the past month for all the belting required in Ogilvie's new flour mill in Montreal, the cost of which will be in the neighborhood of $10,000. This, we understand, is the fifth contract made with the same firm. During a visit to these works we were shown through the large premises from cellar to attic, and found each department of the business under control of a competent head foreman, while the machinery employed is of the latest improved design. Mr. Sadler informs us that not a single article of American machinery is used in these works that can be purchased in Canada. He is a strong protectionist, and believes that the only way to encourage Canadian manufacture is to stick to home production. A good example indeed, and one which should be imitated by every Canadian who desires to see his country prosper. We have pleasure in directing attention to this firm's advertisement on another page.

TEES & CO.—DESKS

An office desk is a commodity which but few men, either in business or private life, care to do without. As in all other branches of trade, desk makers have sought to bring their manufacture as near perfection as possible, and in this they have succeeded. Through the courtesy of Mr. Tees we were permitted to visit the show room of the above firm in Montreal, where is presented for view every variety of office, school, lodge and other kinds of desk, from the cheapest to the most elaborately finished. Messrs. Tees & Co. have been established in this business for so many years that they now control the bulk of the trade of eastern Canada, and a fair share of the western trade also. Almost every reader of THE LUMBERMAN requires, at one time or another, one of these essential articles, and they will be consulting their own interests by writing for one of the firm's new illustrated catalogues now in press, and at the same time keep their eye on the advertisement now appearing in this journal.

GEORGE BRUSH—MACHINERY.

The name of the "Eagle Foundry," of which Mr. George Brush is the proprietor, is so well known that an extended notice is quite unnecessary. This business is among the oldest in the city of Montreal, having been established so far back as the year 1820. The manufacture consists of steam engines, steam boilers, hoisting engines, steam pumps, bark mills, circular saw mills, shingle mills, ore crushers, mill gearing, hand and power hoists for warehouses, etc. Mr. Brush has gained a reputation from one end of the Dominion to the other for the excellence of the machinery manufactured. The extensive works are located at 14 to 34 King and Queen streets. Read advertisement on page 15 of this issue, and watch this space for the handsome illustrated announcement which will appear in our next issue.

THE RATHBUN CO.—BUILDERS' SUPPLIES

This extensive firm have two announcements in this issue of the THE LUMBERMAN. One will be found on page 16, and another on the third page of cover. The Rathbun Co., of Deseronto, Ont., is now classed as among the most extensive corporations doing business in Canada. The diversity of manufacture is such that it is a difficult matter to arrange a concise list. The principal production, however, is lumber, railway ties, telegraph poles; sash, doors, blinds, mouldings and, in fact, everything in the way of building material. The company, in addition to their mammoth works at Deseronto, have branches in Kingston, Napanee, Ottawa, Peterborough, Toronto and many other places.

NAPANEE CEMENT CO.

The advertisement of this company appears for the first time in this issue. The hydraulic cement manufactured by them is used for a variety of purposes, and is particularly adapted for dams erection of chimneys, foundations, culverts, cisterns, cellars, etc. Full information will be furnished by the manufacturers, the Napanee Cement Co., Napanee, Ont.

BUTTERWORTH & LOWE—SAW MILL MACHINERY.

We would direct attention of saw mill owners and others to the announcement of the above firm on third page of cover. This is an American firm of long standing, with extensive works at Grand Rapids, Mich. They manufacture almost everything used in Canadian saw mills, and desire to do a share of the trade of this country. Our readers will find something fresh from month to month in the space allotted them, and we hope that THE LUMBERMAN may be the means of introducing the manufacture of this firm to the favorable consideration of Canadian buyers of saw mill machinery.

ROBT. MITCHELL & CO.—FIRE EXTINGUISHERS.

Fire protection by automatic fire extinguishers is a simple method of getting out of trouble, and a good preventative against loss by the devouring element. Messrs R. Mitchell & Co., have a handy and inexpensive devise for this purpose, and illustrate the same on page 14 of this issue. To lessen one's insurance by utilizing a device of this kind, saves money, and as this is something which everyone desires to do, we would advise readers of THE LUMBERMAN to equip their mills and factories with the latest improvements in automatic sprinklers.

S. S. KIMBALL—SAFES, ETC

The class of manufacture carried on by Mr. Kimball, 577 Craig Street, Montreal, consists of Champion Stump and Stone Extractors, Safes, Cultivators, Hay Presses, etc. The safes manufactured here are among the best turned out in Canada, the leading features of some of the best American safes being brought into use. Mr. Kimball is a thoroughly practical machinist, and the best indication of his success is the rapid increase in his business. Lumbermen and others requiring safes will find this establishment equal to any in Canada, while the prices are at least 25 per cent. lower.

Prizes for Mechanics.

With the view of diffusing mechanical knowledge in Canada, the *Dominion Mechanical and Milling News* is giving a cash prize of $10 every month for the best essay on a mechanical subject selected by the editor. The subjects, which relate to all branches of mechanical knowledge, are announced in the *D. M. & M. News* a month ahead Some of our clever, thinking mechanics in this locality should compete for these prizes. Full particulars may be obtained by addressing Publisher *Dominion Mechanical and Milling News*, 31 King Street West, Toronto.

When opening correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

McLaughlin Brothers, lumbermen of Ottawa, have sold their entire season's cut to the New York Exportation Company for a price close on to $500,000.

James Chase's saw mill at Clachan was found to be on fire at 5.30 on Friday morning by some of the neighbors, who succeeded in quelling the flames, after property to the value of about $500 was damaged. There had been no fire in the mill for over a week, as it was undergoing repairs. Traces of coal oil were found.

The Ottawa forwarding firms are busily engaged in making contracts with the lumber dealers for the freighting of lumber from the Chaudiere to Montreal and Quebec. Several large contracts have been made and there is every prospect of a good trade this summer. The prices for good lumber promise to be slightly higher than last season and culls somewhat lower.

OUR LETTER BOX.

SOMETHING ABOUT SHINGLES.

KINGSTON, Jan. 14, 1887.

To the Editor of the Canada Lumberman.

DEAR SIR —Among the many kinds of material now used by architects there is none subjected to so many different opinions as shingles One man says: 'give me shaved shingles for durability," and as proof of his opinion he will say, "there is that old barn yonder, I and my father cut the bolts out of trees which grew on such a hill, drew them to the shanty on an Ox sled, and shaved them evenings by the light of a fat pine knot when Jim was the baby, (that is over 30 years ago) and this roof is not altogether worthless yet and we left the sap on too. If I could get them I would have shaved pine shingles sure !"

Next observer says, "I don't like sap. I shingled my house, or barns, and the sap is all defective while the heart-wood is good. I believe like my friend No 1 that shaved pine shingles are best but take the sap off for me "

No. 3 says, "I like cedar shingles, (shaved of course). There is such and such a roof made out of shaved cedar, which my father made long ago. They were 2 feet long and ⅜ in. thick. They are worn very thin where the lap comes but will last a while yet. I prefer cedar."

No. 4 says, "I have not much experience in shaved shingles but in 1862 I shingled my house with X X X pine sawed shingles and it is a good roof yet. The sap was all taken off. I believe it will last 8 or 10 years yet."

No. 5 says, "I shingled my house with sawed pine shingles, sap all off, and I got my shingles from the same mill and the same man made mine that made No 4's. He said mine were as good as he could make, and my roof lasted about 12 years, and I had to put on another roof. I took cedar the last time I don't like sawed pine shingles. There is a fuzz on them that holds dampness and soon rots."

No. 6 says, "I like sawed cedar; they lay more flat and don't split and curl up so much as pine does."

And more of these kind of theories could be brought forward if space would permit.

Now the question is, which is the best and how can we harmonize the different views expressed ? for they are all true and are repeating themselves every day.

In the first place, let me say, it is not the sawing or shaving of a shingle that makes them stand the weather best or last longest. I know the roof well that No 1 mentions, it has lasted over 30 years and No. 4's roof will also last 30 years.

The former was cut green, bark taken off, split and shaved; the turpentine dried in the timber and made the sap hard. It lasted almost as well as the heart wood.

No. 4's roof was cut and split green, drew to the shingle factory 4½ lengths, sawed early in the spring before the gum or turpentine had been run out. It was not put in the water. When it was sawed the gum and pitch collected at the bottom of the saw teeth. When the sawyer filed his saw he took his jack knife and cleaned the gum off his saw teeth so as not to stick up the teeth of his file. Then they were packed up in bunches and kept under cover dry until laid on the roof. They were cut across the grain, not slab fashion. They won't curl nor split any more than No. 6 s cedar did.

No. 2's shingles had black sap on them when they were nailed on the roof. The sap might have been green and bright when bunched up but they were not kept covered and lay exposed to wet before used. Sap is not very good under any circumstances, but unless the gum dries in the wood it is almost worthless.

No. 5's shingles were sawed by the same man that cut No. 4's. These shingles were made of nice pine saw-logs 12 to 15 inches in diameter, had laid in the water three years when the sawyer sawed them All the gum spots on the side of the saw and the saw teeth became clean and bright. There was nothing in the wood to preserve the shingles; the sap was taken off but still they rotted in 12 years. Had they been cut before the gum had left the wood they would also have lasted 30 years.

No 3's roof lasted well because they were ¾ in. thick. Cedar makes good shingles but they require to be thicker than pine. They don't rot but wear out. The nails rust and become loose in the wood more than in pine.

Hemlock makes a good shingle if not too wide and laid 4½ inches to the weather. I don't know the durability of hemlock shingles, I have made and sold hemlock, ash and tamarac shingles and they have given good satisfaction.

I had one man say to me once, "Hoppins, your theory about the durability of shingles, depending on the way that the timber is handled before manufactured, is all wrong. My father and I made the shingles on our buildings and we made some of them out of pine that lay on the ground until the moss and vines had grown over top of the logs and it made good shingles and they have lasted as long as those that you say were cut green."

"Yes sir," said I, "there were no worm holes in that moss covered tree neither were there?" "No," said he. Now this proves my theory true more than not true. There is a kind of pine, which in this part of Ontario we call yellow pine or cork pine. It is not the common pine generally growing in our pineries, the sap is not over ½ inch thick. This kind of pine does not rot easily and it is very scarce. Not much of this kind of pine gets manufactured into shingles. As proof of that it is different from our common pine. The worms do not work in it My long and watchful experience in shingles convinces me that shingles cut out of good large pine and kept out of water are best, the durability 30 years ; cedar not much difference, whether kept out of water or not durability 20 years. Pine left in water for a couple of years 12 to 18 years; hemlock, tamarac and ash I have not tested but I believe they will last 20 years. I erected two dwelling houses last year and put hemlock shingles on them, I intend to erect two more this year and will put hemlock shingles on them also.

A. HOPPINS.

A FEW POINTS WORTH CONSIDERING.

TORONTO, Jan. 27th, 1887.

To the Editor of the Canada Lumberman.

SIR.—As your journal is the only one devoted to the interests of the Lumber business of Ontario, I desire a short space in your columns in order to ventilate a few of the many grievances that for years past the lumbermen of Ontario have been enduring

First of all I take up the Insurance Question. As a rule a saw mill is shut down for five months every year. The danger from fire, not only to the mill but also to the lumber piled in the yard, is very small, but notwithstanding this the Insurance Companies charge the same exorbitant rates as when the mill is running, and the risk from fire correspondingly large, declining in all cases to make any rebate.

Secondly, why should lumberman have to furnish car stakes ? Should not the Railway Companies be compelled to stake every car before it is loaded ? If not, why do they invariably provide lumber for railing up the doors of grain cars ? To ship one million feet of lumber requires an expenditure of at least seventy-five dollars for car stakes Should the shipper or the Railway Company bear this expense ?

These two questions and the vexed one of weighing lumber have long been of interest to the trade in general. There is in my opinion, only one way by which justice and fair play can be obtained. It is by the lumbermen of Ontario forming a union and taking united action to avoid the heavy losses they have sustained in the past. The lumber section of the Toronto Board of Trade has proved itself to be a distinct failure. Now is the time for action. Will not those who have millions invested in lumber limits, saw mills and lumber, take the initiative.

Yours truly,

A LUMBER MANUFACTURER.

THE MAGUIRE FAILURE.

FURTHER particulars, which have come to hand since our last issue, go to show that there has been something crooked in the matter of the Maguire failure, which took place in Montreal in December. At a meeting of the creditors of this firm recently held, the Messrs. Maguire presented a statement which lumps the liabilities at about $327 000, and the assets at $300.000. and undertakes to account for their suspension by the fact that eight of their vessels are locked up at Buenos Ayres in consequence of the cholera outbreak there. The statement and figures submitted were regarded as unsatisfactory by the chairman, Mr. R. R. Dobell, and others, in consequence of the absence of a proper set of books and of ordinary business entries with details of some of the firm's transactions. After an adjournment of some hours the insolvents produced the books which had been kept by them from which it appeared that the last entry in the day book was made in the early part of October. The creditors who had objected to the firm's system of book-keeping pointed to the fact in justification of their complaints. The insolvents thereupon surrendered their estate to the creditors, and the meeting proceeded to appoint three trustees to take charge of it. The first two named were the Hon. James G. Ross and Mr. Kennedy, from the office of Messrs. R. R. Dobell & Co., and the third was appointed by the Bank of Montreal, in the person of Mr. Meredith, of Montreal. The trustees will make a full investigation into the affairs of the firm, and will report as to the best means of realizing upon the estate. Meanwhile Mr. James Maguire continues to manage the estate under instructions from the trustees. Since the date of the meeting above referred to, however, a new phase has occurred in this matter, caused by the entry of an action in the Superior Court at Quebec. The action, we understand, is for $100,000, and is taken by Messrs. Kidder, Peabody & Co., of Boston, against Messrs. D. & J. Maguire, the Hon. James G. Ross, and the three trustees of the insolvent estate. Hon. James G. Ross. has mortgages amounting to $64,000 on nine of the Maguire ships. The action seeks to set aside these mortgages on the ground that they give Mr. Ross an undue preference as a creditor. It also applies for a writ of injunction to restrain Mr. Ross and the trustees of the estate from controlling the ships belonging to the firm, on the ground that the plaintiffs had no part in the appointment of the said trustees. Messrs. Kidder, Peabody & Co., who are the American agents of the Barings, have a claim against the estate of about $90,000.

PERSONAL MENTION.

[Contributions from or concerning our friends and patrons are freely welcome to this column. The name of the sender must always accompany such notices.]

Mr. E. B. Eddy, lumberman, has been elected Mayor of Hull, Que.

The Ottawa Board of Trade have elected Mr G. B Pattee, lumberman president for 1887.

Mr. G. C. Pattee, of Perley & Pattee, lumber merchants of Ottawa, will make a trip to California, where he has an orange plantation.

THE LUMBERMAN was favored by a call a few days ago from Mr. Geo. Cormack lumber merchant, of Whitby. He report a prosperous business.

News has been received of the death of the well known lumberman of the Mattawa, Mr. Noah Timmins, which sad event took place January 12th. Mr. Timmins was obliged to go down to Montreal some time ago to have an operation performed. His system was considerably run down by the trying affliction and he succumbed. Mr. Timmins has been identified with the Upper Ottawa country for the last thirty years, residing at Mattawa where he carried on a large lumbering and mercantile business. His many friends in the business will miss him as he was one of the landmarks of the Upper Ottawa. The deceased gentleman was about 65 years of age and leaves a numerous family.

It is probable that Mr. George Humphrey, lumber merchant, who ran Mr. McGreevy so closely in Quebec West at the last general election, will again be his opponent in the Liberal interest.

Hon. H. W. Pratt, a Parry Sound, Ont., lumberman, recently received the nomination for a seat in the Ontario parliament, but it was found that through some informality in his naturalization papers, he is still a citizen of the United States, and therefore incapable of holding office in the Dominion. He is a partner of A. N. Sprat, of Alpena, Mich.

Mr. F. E. Bushwell, of Grand Haven, Mich., has returned home from a several weeks' trip to the Spanish river, Georgian Bay, Ont., where his firm is putting in a large sawmill plant.

The Ottawa *Evening Journal* thus compliments a well-known lumberman : It is a pity that Mr. J. R. Booth will not stand for South Renfrew. Such men as Mr. Booth are needed in Parliament by the country.

The serious loss by fire which fell to the lot of Mr. J. M. Irwin, of Peterborough, on the 27th ult., is to be regretted. His fine residence was completely destroyed, as well as a considerable amount of valuable household effects.

Mr. J. T. Lambert, lumber broker of Ottawa, has recently returned from a trip up the Colonge River. He reports the lumber trade in that district to be brisk, and states that the great quantity of snow up there has not effected operations in the least. The lakes are beginning to flood, however, owing to the large body of snow on them, and as a result traffic is difficult.

Mr. Alex Calley, at one time engaged in the lumber business in Western Ontario, has opened out business as general merchant and commission agent under the style of Calley & Co., at 15 Merton Chambers, Stanley street, Liverpool Eng.

THE TIMBER LICENSES IN THE DISPUTED TERRITORY.

The Minister of the Interior has issued a fly sheet, containing a statement regarding the timber limits in the disputed territory. Licenses to cut this timber were first granted by Mr. Mackenzie's government. The form of lease was sanctioned by Mr. David Laird, then Minister of the Interior, Mr. R. W. Scott, Secretary of State, and Mr. Edward Blake, Minister of Justice. In the case of the first lease a bonus of $20 a square mile was given, and in the case of others issued under that government, $15. But the leases were for twenty-one years ; and the bonus, spread over the term of the lease, would be about $3 a mile per annum. Under the present government the system was continued, but it was modified by substituting an annual for a twenty-one year's lease, and making the rental $5 instead of $2 with $15 spread over twenty-one years. Under the modified policy 121 orders in-council were passed, but only twenty-two licenses were issued. Of twenty-one licenses issued timber was cut only under one. The last of the licenses expired on the 31st December, 1885, and the government has persistently refused to renew them. Of the twenty-one years' licenses four are still in existence, three o which were issued by the late government ; and the holders of these licenses are the only persons now cutting timber in the disputed territory. Six persons in whose favor orders-in-council were issued never received licenses Permits for cutting cordwood, telegraph poles and railway stuff were issued, but they have all lapsed, and none of them has been renewed. It is very desirable that some arrangement should be made by which timber could be cut in the disputed territory.

Send in your subscription for 1887.

POWER AND ITS TRANSMISSION.

IN order to save considerable time and trouble in searching for information with regard to the transmission of power, says the *Millers' Journal*, the following data have been collected from a mass of irrevalent matter. The reader will be able to find at a glance what he wants to know in order to be able to makec acurate calculations.

BELTING.

Belting is daily coming more and more into use, and it is safe to say that at least 95 per cent. of the power is transmitted by it, while in Europe the greater part of the power is transmitted by cog-wheels.

THE POWER OF BELTS

is derived from the friction between the surface of the belt and the pulley, and is governed by the same laws as in friction between flat surfaces. The friction increases regularly with the pressure, and the more elastic the surface the greater the friction. The only fault to be found with the system of belting is that a portion of the revolutions of the motor are lost. The number of revolutions lost vary with the load as it changes. Ordinary belts will safely sustain a working tension of 45 pounds per inch in width.

WIDTH OF BELT, ETC.

The rule to determine the width of belt and size of pulley required to transmit a given horse-power is easily found. Since a horse-power is 33,000 pounds raised one foot high per minute, we must adjust the width and velocity of belts so as to effect the required result. Thus, if a belt moves with a velocity of 733 feet per minute, a belt five inches in width will transmit five horse power, provided the effective tension is 45 pounds per inch. If the velocity be increased up to 1 466 feet per minute the same belt with the same tension will transmit ten horse-power, so that a five inch belt applied to a five foot pulley making 120 revolutions per minute would transmit ten horse-power when the effective tension is 225 pounds.

By taking the actual tension of the belt and multiplying it by the actual velocity, we get what may be called the indicated horse power of the belt, which corresponds to the indicated horse-power of the engine. By measuring the actual power transmitted, by a dynamometer, rules may be based upon the amount of belt surface in contact with the pulley.

For practical purposes, velocity and power to resist tension are the only available elements of calculation.

Actual tension, adhersion, friction, &c., can all be varied at will and form no certain dependence for calculation. It may, however, be adopted as a rule that the adhersion and capability of belts to transmit power is in the ratio of their relative lengths and breadths. A belt double the length or breadth of another under the same circumstances will transmit more than double the power, and for this reason it is desirable to use long belts. By doubling the velocity of the same belt its effective capability for transmitting power is also doubled.

Belts which run vertically should always be drawn tight, or the weight may prevent its adhering closely to the lower pulley, but in all other cases they should be moderately slack.

In order to obtain the greatest amount of power from belts the pulleys should be covered with leather, and more power can be obtained from the grain or hair side to the pulley than the flesh side, as the belt adheres more closely.

The most effectual remedy for preventing belts from running to one side of the pulley, would be to find out first if the face of the pulley is straight, if not to straighten it. In some cases the shafts may not be in line. The remedy in this case would be to slacken up the hanger bolts and drive the hangers out or in, as the case may be, until both ends of the shaft become parallel. This can be determined by getting the centres of the shafts at both ends by means of a long strip of board.

TIGHTENERS

should be placed as close to the large or driving pulley as circumstances will permit, as the loss of power in the use of a tightener is equal to that required to bend the belt and carry the tightening pulley; therefore, there is a greater loss of power by placing it near the small pulley, as the belt will be bent more than near the large one.

Belts always run to the highest side of the pulley, because of centrifugal force, aad that part of the belt nearest to the highest part of the rounded pulley is more rapidly drawn, because the circumference of the pulley is greater at that point.

LENGTH OF BELTS.

The rule for finding the length of a belt desired is to add the diameter of the pulleys together, devide the sums by 2, and multiply the quotient by 3¼; add the product to twice the distance between the centres of the shafts, and the sum will be the length required.

WIDTH OF BELT.

The rule for finding the width of belt to transmit a given horse-power is to multiply 36,000 by the number of horse power; multiply the speed of the belt in feet per minute by one-half the length in inches of belt in contact with smaller pulley; divide the first product by the second, the quotient will be the required width in inches.

HORSE-POWER OF A BELT.

Following is the rule for calculating the number of horse-power a belt will transmit, its velocity and number of inches in contact with the small pulley being given: Divide the number of square inches in contact with the pulley by 2, multiply this quotient by the velocity of the belt in feet per minute, divide this amount by 32 000 and the quotient will be the number of horse-power the belt will transmit.

To ascertain the horse-power which belts will transmit, multiply the width of the belt by the diameter of the pulley (in inches), by revolutions of the pulley (per minute), by the number in the following table corresponding to the pull the belt can exert per inch of width. Example: 10 inch single horizontal belt, 36-inch pulley, 200 revolutions, pull taken at 50 lbs.

10″x36″x200x0 0001—28.8 horse-power.

The pulls which belts 1 inch will transmit are as follows:

Single horizontal belts	50 lbs.
Double	100 "
Single vertical	40 "
Double	60 "
Quarter-twist single belts	25 "
" double	40 "

Pull exerted by belt 1 inch wide, in pounds.	Horse-power—Pulley 1 inch diameter, one revolution per minute, belt 1 inch wide.

HOW TO PUT ON A BELT.

Never try to put on a belt on the pulley in motion. Always place it first on the loose pulley, or the pulley at rest, and then run it on the pulley in motion.

ADHESION.

Adhesion of the belt with the pulley is found to exist most perfectly between surfaces that are coated with some semi-liquid. Castor oil has been found to have an excellent effect, and it is claimed that a belt three inches wide impregnated with it will transmit as much power as a 4 inch belt without it, and, besides this, rats will avoid castor oil, hence they will not touch a belt with it on.

Printer's ink has been recommended as a means of preventing belts from slipping. Neatsfoot oil, with a little resm, has been found very useful when a belt becomes hard and dry, but castor oil and glycerine are the best for this purpose.

The power required to bend the belt from a straight line and cause it to lap tightly around the pulley would not at first sight appear to be worth considering, but it will be found that where the belts are thick and rigid this item becomes an important one, and it becomes advisable to lessen it. The thicker the belt the more difficult it is to bend it It is therefore more economical to use broad, thin belts than narrow, thick ones, as it has been found that the resistance of the belt to bending is inversely as the diameter of the pulley, large pulleys being more economical in this respect

LACING A BELT.

There are many ways of making a lace joint or sewing a belt The following has been recommended: Suppose the belt to be 8 inches wide, punch holes not larger than 3 16th, beginning at ⅜ inch from the edge and one half inch from the end, making the holes ¾ of an inch apart from centre to centre. This will give eleven holes. Let the holes in either end of the belt be exactly opposite to each other. Now place the belt in position with a lace thong, not to exceed in width the diameter of the holes cut from a thin side of lace leather. Begin at one edge to sew your belt exactly in the same manner as you would lace your shoe, drawing the ends well together at each stitch. Having worked across the belt, secure the last edge with one end of the thong by sewing over and over, and repeat the operation to the place of beginning, securing the ends of your thong by inserting them in leading holes made by an awl.

POWER OF BELTS.

The smoother the surface of the belt and the pulley, the more friction is obtained. The following ingredients when mixed can be put on the inside of a belt, when the inside is put next to the pulley. They will be found to have a very good effect, as they will keep the surfaces cool, smooth and moist: 5 lbs of common tallow, 1 lb of yellow wax, 2 lbs of common chalk, 1 lb of blacklead and 1 lb of resin. Dissolve together by gentle heat; put upon the belt when slightly warm. Keep well stirred while applying it; use a little at a time and frequently. It is better, however, to put the hair side next the pulley for power and grip, but the belt will not last so long.

THE COST OF SUPPLYING ELECTRIC POWER.

THERE is nothing in the electrical business that is exciting more interest at the present time than the transmission of power over electrical wires. In the city of Boston there are over a dozen elevators now using this system, to say nothing of the different places where power is used to run printing presses, and for all kinds of manufacturing purposes. Thi power is now in practical use, not only in this city, but in Providence, Woonsocket, Pawtucket, Worcester, Portland and other places. Who can see the end of the advantages to be derived from this great improvement in transmitting power? Every floor of high buildings in cities can have power of the most economical kind. We publish below an estimate by the Sprague Railway and Electric Motor Company, of the cost of supplying this system using the Sprague motors run from electric light or power stations. The figures are of interest to any one interested in the cost of power.

Estimate of the Cost of supplying Electric power from a Station already Established, and the profits Therefrom.

We will assume the station to be already in running order, and furnishing lights for both day and night service, and to be of the capacity of one hundred and fifty-horse power.

Owing to the intermittent use of power by consumers, so well known to steam power producers, if the power delivered to any one consumer be limited to say, ten-horse power, at least double the output of the engine, or three hundred-horse power, could be sold from this plant were it transmitted by the ordinary methods, and, as the loss in transmission by wire is not nearly as great as by belting and shafting, especially where the distance exceeds one hundred feet, the same law of general average is truer in the case of electric power than in that of steam,—we therefore could base our calculations upon the well known practice of all power producers,—but to avoid any possibility of dispute, we will assume that only fifty per cent. above the actual output of the engine can be sold.

INVESTMENT.

Additional wires, structures and switches	$2,500 00

RUNNING EXPENSES.

Coal, (cheap fuel, three tons screenings to one ton Cumberland) four pounds per horse power per hour, ten hours per day	$2,200 00
Oil, additional	100 00
Moter inspector (can also attend to lamp inspection).	500 00
Water, incidentals, etc.	200 00
Other expenses which cannot be specified	500 00
Total	$3,500 00

PROFITS.

Income from 225-horse power at $125.00 per horse power per annum	$28 125 00
Less expenses per annum	3,500 00
Profits	$24,625 00
Income from 225-horse power at $100.00 per annum	$22,500 00
Less expenses per annum	3,500 00
Profits	$19,000 00

Where the station is only running during the night, the profits are the same as above, after first deducting the additional expense for engineer and fireman for day service, but as all incandescent plants to be a complete success must be run during the day, and as such has been the experience of so many plants, it hardly needs mention, and the additional profit from the day lighting will, in almost every instance, more than cover the extra expense.

SMALLER PLANTS.

In small cities and towns, where not more than 100-horse power can be sold within a reasonable time, it is often considered advisable for the company to own the motors, and as the intermittent use in such small plants will not be so great, we will assume that only the output of the engine can be sold: the investments and profits therefrom, would be as follows:—

INVESTMENT.

Motors, various sizes, up to 10-horse power and aggregating 100 horse power	$10,000 00
Wires, structures and switches	1,000 00
Total investment	$11,000 00

RUNNING EXPENSES.

Coal (as above)	$1,550 00
Oil (additional)	50 00
Inspector (lamp inspector for small plant can attend to motor inspection)	500 00
Water, incidentals, etc	150 00
Other expenses which cannot be specified	500 00
Total expences	$2,750 00

PROFITS.

Income from 100-horse power at $125.00 per horse power per annum	$12,500 00
Less expenses	2,750 00
Net profit	$9,750 00
Income from 100 horse power at $100.00 per horse power per annum	$10,000 00
Less expenses	2 750 00
Net profit	$7,250 00

The figures as given above for expenses are not theoretical but are founded upon the actual expenses of running electric light and motor stations, using Armington and Sims engines and the Jarvis setting for boilers.—*Boston Journal of Commerce.*

CHICAGO AND THE WEST.

A REVIEW of the lumber traffic of the West for 1886 presents some new featurers of interest, and shows an average business compared with the preceding years. During the winter months a good demand for lumber gave promise of increased business, and a full stock of logs was provided, and mills in all sections, with the exception of the Saginaw Valley, were fully stocked. When the sawing season opened in April the hours of labour were generally reduced from eleven to ten per day. During 1886 fully 75 per cent of the saw mills of the West were operated eleven hours per day, and hereafter the hours will be uniform in the States of Michigan, Wisconsin and Minnesota. Few new mills were built during 1886, but those in commission have manufactured an average quantity of lumber, estimated at over 7,000,000,000 of feet. Two notable features relating to the manufacturing interest are worthy of mention. First, the large demand for standing pine timber and an advance in value of 20 per cent. in the lumber States on the lakes. The other feature was the steady and rapid growth in the amount of lumber distributed by railways from the mills direct, whereby the large expense of handling so bulky an article in the costly markets of cities is avoided. All important lumber manufacturing towns are now connected by railroads with the markets of the entire country, and Saginaw, Muskegon, Manistee, Grand Haven, Oconto, Menominee, Eau Claire, Wausaw, and Minneapolis are each to-day a better distribution point than any city to which lumber must be first shipped by lake and then pass through the expensive system of distribution which rents, towage, city taxes, insurance, and more enpensive labor always involves.

During 1886 greater progress has been made in the direction of direct shipment from saw mills by rail than in any former year. This increase is largely due to the fact that trunk lines of railway have pushed their branches into the lumber-producing sections to obtain business. The St. Paul system by its connections extends throughout Wisconsin and the Chicago and Northwestern Company, together with its Omaha division, reaches every important lumber town in Wisconsin and Minnesota Following their example, the Chicago, Burlington and Quincy, by constructing its Chicago, Burlington and Northern division and its connections, is enabled to reach all the best lumber-producing points. By these three lines of railway alone more than 15,000 miles of the best lumber-consuming territory is made directly tributary to the points of manufacture.

With all its advantages of a large local business and the immense capital employed and its unequaled facilities for a general distribution of lumber, Chicago can not long retain its present position as the best lumber market in the West in all respects. While no other city can hope to become a larger market, the combined shipments by railway from mills will materially reduce the lumber business of Chicago. Receipts of lumber in Chicago have declined 20 per cent. since 1881, and the decline in 1886 compared to 1885 is 5 per cent. and if any change occurs hereafter, it is likely to be a gradual reduction annually.

The prospect of a larger yard business for 1886 was dispelled by the general labor troubles in Chicago, which not only closed the lumber yards for eighteen days in May, but checked building operations generally. The sale and shipment of lumber has gradually increased, but the average sales of lumber for the year will show no important gain over 1885. The value of lumber has increased full 10 per cent. during twelve months past. This increase was divided between the manufactures and yard dealers. Stocks at the mills for spring shipments are less than at the opening of navigation, and at Chicago, Memphis, and Saginaw the principal distributing points the stocks for sale are 10 per cent. less than one year ago. Eastern buyers have taken more than 6 per cent. of the lumber manufactured at the mills of Lake Superior and Lake Michigan during 1886, and will exceed that quantity in 1887. Five years ago such sales were not expected and seldom made beyond a few 3 inch deals for export.

Saginaw shows a reduced manufacture of nearly 20 per cent. compared to 1885, which accounts for the large purchases West for Buffalo and the East. Capital is ample to absorb all the desirable pine timber that is offered for sale in Michigan, Wisconsin, and Minnesota, and an increasing demand is likely to advance the price of lumber during 1887, and from present indications all engaged in conducting the lumber trade of the West may safely look forward to a satisfactory business during the coming year.

The cargo business at the exchange docks, taken as a whole, was slightly better than in 1885, in spite of the fact that the month of May was practically lost, as the labor troubles prevented manufacturers from shipping to this market. The cargo sales for the season of 1886 were 260,731,592 feet of lumber, 444,474 250 shingles, 395 527 450 lath, and 31,502 cedar posts. Compared with 1885, there was a decrease of 8,445,-091 feet of lumber, 9,992,975 lath, and 20,454 cedar posts, but an increase of 117,465,750 shingles; reducing this excess of shingles to feet and the aggregate sales were 325,247,553 feet, an increase of 3,732 040 feet over 1885.

The hardwood dealers have had a good average year, and compared with the two preceding ones sales show a slight gain. The over-production the past three years has been disposed of, and supplies throughout the country are considerably lighter. There is, however, no scarcity of any grade of stock. The furniture manufacturers have chiefly run on a cheaper grade of wood that will stain red and pass for cherry. In the last half of the year the makers of fine furniture turned their attention to oak, which was also used extensively for the interior of fine residences and office buildings. The coming year promises a big "boom" in this wood, but as it is not expensive, it is not expected to have the run that cherry and walnut did. Gums met a large sale, and were freely offered from the South at moderate prices The labor troubles in the spring greatly interrupted trade during May, but well informed dealers say the time lost was a benefit to them, for they were forced to hold cherry, walnut, oak and poplar, and that has advanced 5 per cent. the past six months, from which they have reaped a practical benefit.

CANADIAN SOCIETY OF CIVIL ENGINEERS.

THE committee authorized by the Civil Engineers who met in Montreal last Autumn to prepare a constitution and rules for a Canadian Association of Civil Engineers, have completed their work and a meeting of the members was held on January 11th to adopt them. The constitution as drafted, provides that the society shall be called "The Canadian Society of Civil Engineers" and be designated by the letters "C. Soc. C. E." The objects are set forth as being to facilitate the acquirement and interchange of professional knowledge among its members, and to encourage original investigation. The term "Civil Engineer," as used in this Society shall mean all who are engaged in the designing or construction of railways, canals, harbors, light houses, bridges, roads, river improvements and other hydraulic work; sanitary, electrical, mining, mechanical or military works; navigation by water or air, or in directing the great sources of power in nature for the use and convenience of man.

The society shall consist of honorary members, members, associate members, associates, and students. Honorary members shall not be subject to fees or dues, nor be entitled to vote. Associates and students shall possess all the rights and privileges of members or associate members, except the right to vote or hold office. Honorary members must be men who, from their position are enabled to further the objects of the society or who are eminent in the sciences connected with the profession of civil engineer, but who are not engaged in the practice of the profession in Canada. Every check is provided to prevent undesirable members being admitted. It is provided that every candidate eligible for election as member, must have been engaged in some branch of engineering for at least 10 years, which period may include apprenticeship, or pupilage in a qualified engineer's office, or term of instruction in some school of engineering recognized by the Council. Two years will be allowed for any graduate who has passed with honors in his engineering course. The candidate must have had responsible charge of work as a Resident or Superintending Engineer, or a position of equivalent professional responsibility, for at least five years.

Every candidate eligible as Associate Member must have been engaged in some branch of engineering for at least five years, which period shall include apprenticeship or pupilage in a qualified engineer's office or school of engineering.

Associates must be persons not Civil Engineers by profession, but whose pursuits, scientific acquirements or practical experience qualify them to co-operate with engineers in the advancement of professional knowledge.

It is proposed to make of the society a widely ramified institution, and a clause is inserted in the constitution providing for the establishment of local branches of not less than ten members and not less than 100 away from the headquarters of the society or any existing branch.

NEW BRUNSWICK STUMPAGE.

New York Correspondent St. Johns Globe.

The people of New Brunswick are only just now (when it has been so largely cut) beginning to discover that land covered by a growth of timber is of real value—the imposition of a decent stumpage has led them to see this matter in its true light. When $4 per mile was the upset price charged for the cutting of timber on crown land for the period of one year, and when lumbermen are allowed to make such combinations that competition was virtually forbidden among them, and when the man that dared to bid against his neighbor was boycotted, it would be against reason that one should think that that which brought us so low a sum could possibly be worth anything. Now when he is told that he must pay $1.25 for the right to cut from six to eight trees he looks at the matter in a different light. It has been claimed by some that this rate is too high when in reality it is lower that the stumpage on private lands. The crown land stumpage on cedar is certainly too low, only 80 cents per M feet board measure. Now a thousand feet b. m., of cedar will make eight thousand of shingles; the stumpage therefore on a thousand of shingles made out of the log will be but 10 per thousand. This rate of 80 cents per M feet b. m. on cedar cannot under the conditions of the crown land leases be raised until ten years from the date of their issuing be expired. So far from leaseholders on the Miramichi having anything to complain of, they have on the contrary, very valuable properties since, to say nothing of spruce and pine. I know from personal experience that they have vast quantities of cedar on very many of their leases, and as there will soon be a railway bridge over the St. John, they can then run the products of their forest direct to Bangor or other shipping ports. I may mention in conclusion that Messrs. Jas. Murchie & Sons are cutting spruce boards and deals in their mill at Edmundston from logs got on the Madawaska, and shipping the same by rail to St Stephen I presume that so able and intelligent a firm would not do this if they were losing money by the transaction. From this one can learn what may be done by those who thoroughly understand the lumber business

HOW TO SELECT GOOD TIMBER.

PROFESSOR RANKINE says: There are certain appearances which are charateristic of strong and durable timber, to whatsoever class it belongs. 1. In the same species of timber that specimen will in general be the strongest and the most durable which has grown the slowest, as shown by the narrowness of the annual rings. 2. The cellular tissue, as seen in the medullary rays (when visible), should be hard and compact. 3. The vascular or fibrous tissue should adhere firmly together and should show no wooliness at a freshly cut surface, nor should it clog the teeth of the saw with loose fibers. 4. If the wood is colored, darkness of color is in general a sign of strength and durability. 5. The freshly-cut surface of the wood should be firm and shining and should have somewhat of a translucent appearance. A dull chalky appearance is a sign of bad timber. 6. In wood of a given species the heaviest specimens are in general the stronger and the more lasting. 7. Among resinous woods, those which have least rosin in their pores, and among non-resinous woods these which have least sap or gum in them, are in general the strongest and most lasting 8 It is stated by some authors that in fir wood that which has most sap wood, and in hard wood that which has the least, is the most durable; but the universality of this law is doubtful. Timber should be free from such blemishes as clefts or cracks radiating from the center; "cup-shakes" or cracks which partially separate one annual layer from another; "upsets," where the fibers have been crippled by compression; "rindgalls," or wounds in a layer of the wood which have been covered and concealed by the growth of subsequent layers over them and hollows or spongy places, in the center or elsewhere, indicating the commencement of decay.

RAT PORTAGE AND KEEWATIN CUT.

The stock of logs and lumber on hand at Rat Portage and Keewatin, Ont., on the 1st of January will amount approximately to the following:

ONTARIO LUMBER CO. (McCauley & Ryan.)	
Logs	12,000 000
Lumber	9,000,000
RAINEY LAKE LUMBER CO.	
Logs	1,600,000
Lumber	7,000,000
KEEWATIN LUMBER CO.	
Logs	5,000 000
Lumber	11,000 000
MCKINNEY & CO.	
Logs	5 000,000
Lumber	8,000,000
Total	62,600,000

The sawing capacity of the mills aggregate 180,000,000 feet per season. This year one mill, belonging to the Toronto Lumber Co. (John Ross, Homer, Ont.), was not operated.

All the stock sawed last year and what is being cut this winter is cut in Minnesota. There will probably be about 150,000,000 feet cut and run into Canada.

THEY DON'T LIKE IT.

The Grand Falls correspondent of the *Canadian Journal of Commerce*, writes as follows concerning the lumber business in Madawaska:—"The cut of lumber will be about nine or ten million in Madawaska and Victoria counties. Holmes & Hammond will have a new shingle mill started in the spring, on the American side, to help the Vanluren mills in slaughtering our forests. No export duty is looked after in this section and it is not expected there will be before the Americans strip our lumber all off. Our mills are at a stand still. Men of capital, so far, prefer to build on the American side and slaughter the forests on the New Brunswick side to stock them; and it is hard to say how long the government are going to allow it We cannot expect reciprocity in lumber so long as we are holding out a premium to manufacture our lumber out of the country, and allow our mills to remain idle. Mr. G. N. Hammond is driving trade. He has lately branched out in the lumbering of spruce logs which gives a market for hay, oats, beef and employment. If the law was enforced and our lumber stopped from being taken to the American side to be manufactured, he and others would soon start mills on this side of the line."

THE CANADA LUMBERMAN

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. MORTIMER, PETERBOROUGH, ONT.

Terms of Subscription :

One copy, one year, in advance $1 00
One copy, six months, in advance 0 50

Advertising rates furnished on application.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER, Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

Our Readers who write to Advertisers in this Journal, will oblige both the advertiser and Publisher by mentioning the "Canada Lumberman."

PETERBOROUGH, ONT, FEBRUARY, 1887.

THE experiment has been tried with success in England of painting the ends of logs and timber with glue to prevent them from checking while they are drying.

THE *Southern Lumberman* remarks that there is just a little too much of the 'boom' business in the central Southern States at present for healthy business trade.

THE business transacted in the patent branch (Department of Agriculture), Ottawa, during the past twelve months, shows an enormous increase over preceding years. The revenue derived from patents was somewhat over $74,000.

IT has been decided by the authorities at Ottawa, that material and apparatus required in the construction of the St. Clair tunnel will be entitled to come in duty free. These will include hoisting, elevating and pumping machinery. The work is international, and will be of equal advantage to the two countries which it will unite by means of a railway under the waters of Saint Clair River.

A GENTLEMAN whose time is devoted to the handling of Michigan pine, is reported to have said : "The Canada pine does not possess those fine qualities that are found in the Michigan product. A black knot and a fine shake—a hair shake I call it—are characteristics of the Canada stock from the northern shore or Georgian Bay country. However, what comes to this market is mostly select stock, and finds ready sale."

MR. W. W. Johnson, local managerfor Messrs. Dunn, Wyman & Co , has forwarded the annual circular from which the following figures are gleaned : The total failures in the United States for 1886 were 9,834; for Canada in 1886 there were 1,252. In 1885 the failures in the United States were 10,637; in Canada 1,256. The liabilities of the Canadian failures for 1885 were $8,861,609 ; for 1886, $10,386,884. The failures in the United States were, in 1881, 5,582; in 1882, 6,738 ; in 1883, 9,184; in 1884, 10,968. In Canada in 1881 the failures numbered 635; in 1882, 787 ; in 1883, 1,384; in 1884, 1,327.

WE know of no publication that is worth of greater praise by lovers of the beautiful in art and floriculture than *Vick's Floral Guide*, the 1887 edition of which is just to hand. We have been favored with the *Guide* for some years, but the last production seems to excel all others in general beauty, number and elegance of floral and vegetable illustrations, and the large variety of subjects treated. The work is invaluable not only for its handsome chromo sketches, but also for the valuable practical articles intended both for amateur and practical gardeners. Mr. Vick has won for himself a world-wide reputation as a florist, and his immense business at Rochester, N.Y. is an indication of his success.

ABOUT the most elaborate thing in the way of trade publications that we have yet seen came to hand a few days ago, in the shape of an extra holiday edition of the *North-Western Lumberman*. In looking over its contents we find 79 pages (9x13 inches) of advertisements, 39 pages of lumber and logging railroad statistics, and 2 pages of general matter, making 120 pages in all. Its typographical appearance and general make up is in every way creditable, and its list of contents will doubtless prove of considerable value to the trade.

CANADIANS have heard considerable of late concerning the crop-destroying rabbit of Australia, but this does not appear to be the only animal plague of that country. The decay of the forests is traced by Rev. P. Macpherson, of the Royal Society of New South Wales, to the opossums. After much investigation it was ascertained that a single animal would devour about 200 leaves of the eucalyptus, or blue gum tree, in a night; proving that the 18,000 opossums killed annually in one county of Victoria were sufficient to destroy upward of 13,000 trees and lay bare a space of 700 acres, or more than a square mile.

ONE great mistake, says an exchange, which inexperienced advertisers almost invariably make, is to expect too much from an advertisement immediately after its insertion. A new advertiser almost always thinks that large numbers of orders ought to follow the insertion of his advertisement for, say, three or four months. He overlooks the fact that many readers do not at first feel acquainted with him and his wares. They want to see his name in print for a good while before they are willing to forward an order. This is not the case with every one, but it is with a great many. The shrewdest advertisers keep their name and goods prominently before the trade all the time, so that when a man for instance, wants to order any particular article, he will immediately think of them, and referring to the paper for their address, will write for catalogue and prices.

WE have been favored by the publishers of *The Office*, New York City, with a copy of "Dutton's Analytical Book-Keeping Chart." This work is unique, and because of its pointed brevity and simple analysis, will be specially valuable to a numerous class, who may be designated as self-made book-keepers, and who have neither the time nor patience to unravel the long and intricate course of instruction given in most of the text books. The work shows the reasons for the laws of book-keeping by discovering the wants and requirements of business. It also shows the relation of every transaction to the required record and the relations of accounts to each other. The chart, which is inserted in the form of a folding plate, is complete in itself without the accompanying text, but the latter serves to increase its usefulness and to explain many points which might possibly be overlooked without such assistance. This little book is neatly bound in cloth with gilt side title, and is of convenient size and shape for the pocket. Price $1.00, post paid.

WEATHER prognostications are not so common now as they used to be, owing to a scarcity of "prophets." Mr. Vennor, who caused quite a stir in this line for some years, has passed to the silent majority, leaving Professor Wiggins almost alone in the field. To make matters still worse (?) the Dominion Government is reported to have informed the last named "weather indicator" that he must either give up weather prophesying or lose his position as a government employee, and as he has not been heard from of late it is to be presumed that he chose the wiser course. Evidently the government in taking such a step wished to relieve itself of any responsibility which might arise should any difficulty be experienced through the non-fulfillment of the Professor's prophesies. In addition to this the government is wise in selecting for civil servants men only possessing fair common sense. But if Professor Wiggins has been silent others have aspired to the position, and freely stated that the present winter would be a mild one. If the weather since Christmas has not been sufficient to disprove what they imagined to be their weather foresight, then we dont know what a severe winter is, They might, however, verify their assertions by visiting the lumber camps just now, where they would very likely get a "warm" reception.

THE LUMBERMAN made a call a few days ago on the William Hamilton Manufacturing Company, Peterborough, and found the works running to their fullest capacity. Extensive additions were made to these works during the past summer, and the facilities so far increased that to-day this company can boast of being as large, if not the largest, manufacturers of saw mill machinery in Canada. From the high enconimus passed upon the machinery turned out of these works by some of the leading saw mill men of the country, we are safe in saying that no firm has a better reputation among the trade than the one here referred to. In addition to saw mill machinery, this company also manufacture engines and boilers of different kinds, etc. We understand that orders have recently come in from British Columbia, for two boilers, 5 feet in diameter, 14 feet long, and with 58 four inch tubes ; for a tubular heater; a smokestack 75 feet in height ; and for an engine. This machinery is for the Royal City Planing Mills, New Westminister. From Fairhead, Toronto an order for an upright boiler and two hoisting engines has been received. A large marine boiler, containing 138 three-inch tubes, is to be put under construction soon for one of the lake vessels. Added to this is a large amount of miscellaneous work, in which is a large contract for the supply of the iron work to be used at the Trent Valley Canal Works at Burleigh and Lovesick.

IN the course of an editorial article on the inertia of British manufacturers, the *Engineer* says—"We have on previous occasions spoken of the loss to Britain which results from inertia amongst our bridge builders. Some of this is due to the out-of-date regulations of our Board of Trade ; but so far has the British bridge-building trade become wedded to old methods of manufacture and terms of business, that American and Canadian Bridges are now being bought by English civil engineers for railways in course of construction, though not in either of those countries ; but we need not say in which. The orders going to those countries because really satisfactory bridges can be obtained to carry a given load, and with a guarantee for ten years, for a sum which is not more than 60 per cent. of the price demanded by English builders. The American and Canadian bridges are well designed, pin structures, in every way satisfying the engineers of the railway ; and the builder's price is for the bridges placed upon the piers and finished, the engineers having very little more trouble in the matter than to order them and test them ; while for the bridges for the same places, if ordered in England, the engineers would have to provide designs and specifications, follow the structures throughout their whole history to completion, and then pay about 40 per cent. more for them. In railway matters, again, the trans-atlantic constructors will provide rolling stock for prices and terms which afford facilities that probably not more than one English firm gives."

THE Harbor and Ferry Committee of the Belleville City Council, held a meeting on January 20th, for the purpose of discussing the term of a new agreement with the lumbermen with reference to tolls collected on logs passing through the harbor. Mr. David Gilmour, Trenton, Mr. W. R. Aylsworth, representing the Rathbun Company, and Mr. John Bell, Q.C., were present on behalf of the lumbermen. The old contract which was made in 1879 expired last September. Under that agreement the lumbermen furnished all the booms and piers necessary, and assumed all responsibility for the same. The city had to bear the expense of building any new booms required at a cost not to exceed $1,000, but the corporation having already spent $668 in that direction the city only had to pay a balance of $332. There was also a clause which provided that the city should pay ten per cent. of the amount of tolls collected for necessary repairs to the booms, and in the seven years that amounted to $214. But the city was relieved of all responsibility against breakage of the booms. The present tariff, the lumbermen complain, is excessive, but they propose that if the city will assume all responsibility, they will pay the tolls in the old schedule. If the corporation will not do this the lumbermen will ask a reduction in the tariff. After discussing the question for some time the committee asked Mr. Bell to put the proposition of the lumbermen in writing and submit it to the committee. The committee, however, is opposed to the city assuming any responsibility in the new contract.

THE recent change in the attitude of the Toronto *Mail* has caused such a stir in Conservative ranks that the question of starting a new daily paper in Toronto, as the chief organ of the Macdonald Government, has been mooted for some weeks, and at last the project has assumed tangible shape by the appearance, on Monday, January 24th, of the daily *Standard*, with Mr. Louis P. Kribbs, better known as "Pica," at the helm. The new paper aspires to step into the *Mail's* shoes, and promises to give the Conservative party an undivided support. The proprietors of several other journals, notably the Hamilton *Spectator* and the Toronto *World*, have sought to win the confidence of the party, but to all appearance Mr Kribbs has got the inside track. THE LUMBERMAN heartily congratulates "Henery Pica, Esq." on his step in advance, not because he is a Conservative, for we have nothing to do with politics, but because he is an old lumberman. Mr. Kribs spent most of his younger days in and around a saw mill, and it was only through his becoming connected with a country debating club that his natural literary ability showed itself. Finding that practice enabled him to write a tolerably good "essay," he gradually got tired of handling logs, and aspired to literary pursuits. THE LUMBERMAN first met him as the "white-haired" young man of the Toronto *News*, and with many others soon became favorably impressed. After two or three years connection with this journal as city editor, he was offered the position of Ottawa correspondent of the *Mail*, which position he has filled with credit for some months, but during the present crisis he has taken a step higher, and it is to be hoped that his ambition may be handsomely rewarded.

When opening correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

EXCHANGE ECHOES.

Timber Trades Journal, London, Eng.

Several sellers express the opinion that whitewood battens are likely in some cases to be dearer than redwood, but we scarcely understand the grounds on which this opinion is based. It is doubtless the fact that many buyers in Scotland have a much larger trade in whitewood than in redwood, but in the southern districts we have little doubt that, prices being equal, redwood will always command a readier sale than whitewood.

Timber, London, Eng.

It was generally thought that the consumption, which had been failing for the past several years, had reached its lowest in 1885, but the year which has just closed has again experienced a serious decrease. An idea of this shortage may be clearly obtained from the fact that the consumption of deals, battens, and boards in 1885 was 166,453 standards; from this total it has declined to 146,801 standards in 1886. The statistics published by the Surrey Commercial Dock Company of their deliveries show 200,258 standards drawn from their yards n 1885, as against 177,433 in 1886—each succeeding year the quantities growing smaller. These figures tell their own expressive tale without comment.

Du'uth Herald,

Although Duluth has suffered such severe losses of saw mill property by fire during the past few years, it is gratifying to be able to note a decided increase in the amount of lumber cut during the past year, when compared with the cut of 1885. In 1885 the total amount of lumber sawed in the Duluth district was 81,000,000 feet; last year the total sawed was over 171,000,000 feet. Of this amount more than 94,000,000 was sawed in the Duluth mills, 63,000,000 in the mills at Cloquet, about 4,000,000 at Tower and Two Harbors and about 9 000,000 at the Junction and Thompson. The stock carried over to this season does not exceed 18,000,000 feet. The cut for the season of '86-7 is estimated at 134,000,000, of which 70,000,000 is credited to Cloquet, 45,000,000 to Duluth, 13,000 000 to the Junction 4,000,000 to Tower and 2,000,000 to Two Harbors.

Northwestern Lumberman.

The view is frequently expressed that price lists, sanctioned by lumber associations, are made by the wrong men. The proprietors of wholesale yards get together in wise conclave and formulats lists. Generally these proprietors are the money bags of the concerns they represent, but know very little about the details of yard business. They do not sell the lumber, or meet competition in city or country. The men who handle the business are generally junior partners or salaried men. These know something about prices and the state of trade. As a general thing the salaried men in the yards know more about stocks, the actual supply and demand, and real selling values, than the proprietors themselves. There are a few exceptions to this rule, but it will commonly apply. The men who do the talking by telephone from yard to yard are the individuals best informed about prices. So it will be seen that these men should formulate price lists. In order to make list prices approximate selling values, a committee for the purpose should be compo ed of salesmen, shipping clerks and superintendents, with a few proprietors sprinkled in to advise and keep the boys steady. In that way a fairly intelligent conclusion could be reached.

Ottawa Evening Journal.

The results of the elections for the Local Legislature indicate plainly how the contest for the Dominion is likely to end. Mr. Bronson scored a victory, not because he was a Government candidate, but by reason of his personal qualifications for public life. As a prominent, enterprising citizen, who had proved himself a faithful steward in every position which the public had called him to fill, he won the support and sympathy of all classes of the community. The city, though a recognized Conservative stronghold, demanded an intelligent, public spirited representative at Toronto, and made its selection accordingly, irrespective of party considerations. * * * In the Dominion contest on which we are now entering, party lines will, no doubt, be more clearly drawn. * * * Apart altogether from the grave issues presented to the people in this contest, there can be little doubt that their votes will be cast for the Conservative candidates. It is no reflection upon Mr, McIntyre's character to say that Mr. Perley is his superior in every way as a representative citizen. Every claim which was put forward by the Liberal party on behalf of Mr. Bronson for the Local Legislature applies with equal force to Mr. Perley for the Dominion House, with this additional one, which should not be overlooked for a moment, that the Conservative candidate is, besides, largely connected with the railway interest, which, next to the lumber trade, has done most to place the prosperity of Ottawa upon a safe and permanent basis. To Mr. Perley and the enterprising men associated with him in the Canada Atlantic Railway project we are indebted for the splendid facilities for travel and traffic which we possess. One by one the other roads have dropped into the hands of the Pacific Railway Co., leaving the Canada Atlantic Railway as the only competing route to and from the Capital. His enterprise and public spirit in connection with this one project alone entitle him to the gratitude of the public.

Northwestern Lumberman.

At the beginning of the year, having ascertained from his books how he stands, it is proper for every business man to spend a little time in carefully considering what improvements in his ways of doing business he can make in 1887. It is probable that the majority of retail dealers will discover that they have too many accounts on their books. Some of these accounts are perfectly good and will be paid promptly, others will be paid to suit the own sweet will of the men against whom they are charged, still others, in all probability, will never be paid. The average retail dealer will feel after looking over these accounts that he has given two much credit; that he has been too good to his customers; that in his efforts to roll up sales he has been unfaithful to his own interests. Every large business house has its credit man whose duty it is to investigate the financial standing of all who apply for goods on time. Honor is a jewel, and there are poor men whose word can be depended on every time so far as it is in their power to make it good, but no large concern gives but little credit where it does not think that collections can be forced if necessary. Thousands of retailers go on another principle entirely. The impression seems to prevail with too many that the great point is to sell goods regardless of whether they will ever be paid for. Right at this point is where the retail dealer of moderate means can begin to reform his methods. He ought to learn that it is better to have lumber in pile than to sell it where there is a doubt regarding the liability of the buyer, and even if the buyer is reliable, to sell for cash every time he possibly can.

The Bay City Lumberman Gazette.

Notwithstanding the $2 duty on lumber imported into the United States from the Dominion of Canada, the amount is not insignificant by any means, and this leads to the query, what would be the effect if this duty were removed? It would obviously result in flooding the American market with Canadian lumber, and to that extent result disadvantageously not only to our own manufacturers, but to the labor element engaged in that industry on this side of the line. There is nothing in the list which demonstrates more clearly the disastrous results which would accrue to labor, as well as to industrial pursuits in the United States as the lumber business as at present conducted, under a free trade policy; and it requires very little foresight to understand that if the duty on lumber were removed, our lumbering establishments which have been built up under a governmental policy of protection, would soon begin to languish and exhibit signs of decay; in fact it must inevitable prove a blight on the business, and necessitate at once the reduction of the wages of the operatives in order to meet the competition of Canadian cheap labor. It seems incomprehensible that there should be any considerable element among the people who would desire such a result. Ottawa is the center of the Canadian industry. More lumber was sold and exported from Ottawa to the United States during the first quarter of the past year than ever during the same period in history. The cut this season will be fully up to, if not in excess of the average. The total amount of lumber manufactured by the Ottawa mills during the past season is placed at 288,000,000 feet. The principal destinations of the consignments sent from Ottawa to the United States were Burlington, Albany, New York and Boston.

The Timberman, Chicago.

Some genius about a planing mill, has invented a device for unloading the wagons on which the lumber is hauled for dressing, which is so simple and practical that it is a wonder, as it usually is in such cases, that it was not thought of before. The platform on which the lumber is ordinarily piled as it comes into the mill, is raised to just about the height of a wagon, so that, as the load is backed up, the rear end projects over it, A slight depression in the roadway, just in front of the platform, permits the wagon to drop a few inches, and allows the weight of the load to rest upon the edge of the platform. Close to this edge, a live roll is placed, which is given a positive motion by a link belt connection, and behind it are put ordinary dead rolls at suitable distances. The operation of the device will be apparent without further explanation. As soon as the load of lumber rests upon the live roll, it begins moving into the mill, seemingly of its own accord, and sooner than a half dozen boards could be removed from the load by hand, the entire jag is quietly rolled into the mill without handling. It is best to place rollers on the wagon also, in order to make the load move easily and promptly as soon as it rests upon the live roll. To a planing mill operator doing a large busines and who is compelled to employ a number of men and teams to handle the lumber that comes to be dressed, the value of this little device will be perceived at a glance. The saving in time makes it possible to do the same amount of work with a less number of teams, and with a notable economy of labor for the teamster. It has been applied to the new mill of the Ludington, Wells & Van Schaick Company, at Menominee, Mich., where an ordinary six-inch wrought iron pipe, polished, is used for the live roll, being connected with the line shaft with suitable belts and pulleys to secure the proper speed. The beauty of the arrangement is that it is not patented, and may be used by any one. It is said to have been invented by a man at Eau Claire, who certainly deserves the thanks of the planing-mill fraternity for his ingenuity.

THE MIRAMICHI WOOD TRADE.

WE are in receipt of Mr. J. B. Snowball's Miramichi Wood Trade Circular for the year 1886, dated Chatham, Miramichi, January 3rd, 1887. It reads as follows:

The business of the past year has been on as restricted a scale as predicted, but although the export from the principal Spruce Ports has been curtailed, still it is worthy of note that from Nova Scotia, as well as from the smaller ports in New Brunswick (places not having our heavy stumpage tax to contend with) the export has been increased. This has brought the total export nearly up to that of last year. The business however, has not been profitable, and although freights ruled lower than in any previous season, the consumer and not the producer, received the benefit; and it may be said that a feeling of depression still hangs over the trade here.

The freight market opened at from 40/ to 45/ Miramichi to United Kingdom ports—according to port—and closed at about 42/ to U. K., being a strong contrast to the rates paid in 1873, which ranged from 90/ to 120/. The shipments from this port were, this year, less than half what they were in 1877, 1880 or 1883, and the smallest since 1870. We do not, however, expect a further decrease, in view of the fact that the sawing power has been doubled since the latter date and half that power has been idle during the past season.

Last year I referred to the heavy tax imposed by the Province of New Brunswick on all wood cut from Provincial or Crown lands. No reduction has so far been made, although individually, members of the Local Government promised a rebate previous to the last general election. To show the inequality of this tax I may state that in Nova Scotia there is no direct stumpage charge levied by the government. The timber lands there are largely owned by the operators; any lands owned by the Government are sold to the first applicant for forty cents, or one and eight pence (1/8) stg., per acre, giving an absolute title. The Province sold in 1882—35,000 acres, 1884—37,000 acres, 1885—13,700 acres.

In the Province of Quebec there is a lease charge of two dollars per square mile for each mile of timber limits held by the operator, and a stumpage tax, in addition, of six cents on each spruce log cut down. A log is computed to be 13½ feet long; this brings the tax to about 70 cents per thousand super. feet, or 4/ stg. per standard.

In the Province of Ontario, timber lands are leased the same as in Quebec, at two dollars, or 8/ stg. per mile, the holder having a continuous lease—as in Quebec—without fear of molestation as long as the annual fees are paid. The stumpage in Ontario is ten cents per 200 feet board measure, or 50 cents per thousand super. feet, the same as in the Province of Quebec.

In New Brunswick, timber lands are leased at eight dollars per square mile and four dollars per square mile for subsequent annual renewals, and these renewals are limited to ten years from date of lease. The first cost is thus four times, and renewals double the rates of the highest of the other provinces, and a stumpage tax of $1 25 per thousand super. feet is collected, against 50 cents, the highest for the other provinces.

In Quebec and Ontario the quantities on which dues are payable are ascertained at the place of sale, while in this Province, the scaling is done in the woods, thus subjecting the operator to all losses contingent upon transit. The operator in New Brunswick has, also, to lodge and board the Government scalers and their assistants free of charge—an imposition unknown elsewhere in Canada; and while payment of timber dues is required in New Brunswick on 1st August each year, the time of such payment in the other provinces is 30th Nov., a difference of four months.

The Trade justly complains of the inequality of the government charges on this staple industry of the province, and the severity of the timber regulations in other respects—the main features above stated indicating the disadvantages resulting therefrom to New Brunswick operators—conditions which there is reason to believe will be somewhat modified in the near future.

The stocks of both manufactured and unmanufactured woods on hand are estimated at 25 million superficial feet, against 17 millions last year, 26 millions in 1884 and 40 millions in 1883. This winter's operations in the forest are on quite as restricted a scale as those of last year. Last winter and spring were very favorable, both for logging and brook-driving, and all the stock got out came to market. Unless this season it equally favorable we will have a smaller output.

The Montreal Star.

THE MONTREAL STAR is making a name as one of the newspaper successes of the day, both in its daily and weekly issues. The circulation of the Daily last year averaged over 25,000 copies and during the North-West rebellion reached close on 35,000, while the circulation of the weekly has reached the enormous figure of 120,000. THE STAR claims to have attained this success through its merits as a first class family newspaper, as distinguished from a mere political or local organ, but although not pretending to be a political paper in any extreme sense of the term, its political news is second to none, and its circulation has given it a marked influence in national as well as local affairs. Its progress has been extraordinary, as ten or 12 years ago it had only a very limited circulation.

CHIPS AND SAWDUST.

The saw mill at Ompah, Ont., has lately changed hands.

Tett Bros. are rebuilding Salmon Lake dam which broke away last spring.

British Columbia cedar shingles are being shipped eastward to Puget Sound.

Mr. Simmons has his new planing mill at Newcastle almost ready to be put in operation.

A cooper shop and heading factory is to be established by Mr. John Matthews at Kendall, Ont.

There was more lumber turned out this year by the Ottawa mills than any previous year.

The township of Ryde, Muskoka district, boasts of six saw-mills. Five of them are steam mills.

The mill-owners of Turtle Creek, N. B., commenced stream-driving and sawing since the recent rains.

The Windsor cotton factory, Windsor, N. S., is working overtime until 9 oclock at night filling orders.

Mr. Kyle of Brockville, and J. E. Brown, of Delta, Ont., have started an iron pump factory at the latter place.

The Enterprise, Ont., milling company is putting in a new water wheel. It intends to saw shingles and lumber.

Messrs. A. W. Parkin & Son, of Lindsay, are at work getting timbers ready to rebuild their saw and shingle mill.

John Heard & Co., Amherstburg, want $6,000 as a condition of removing their spoke and wheel works to St. Thomas.

W. B. Phelps & Son, of Philipsville, Ont, are putting up a shanty and getting ready to take out ties and shingle wood.

The engine and boiler house of Woodward & Isbister, Petrolia, Ont., was totally destroyed by fire recently. Loss $1,000; partially insured.

A Kippewa correspondent says: "Owing to the lack of encouragement for square timber, none is being taken out this winter in this vicinity.

A load of lumber sleighs was shipped a few days ago from Gravenhurst to Lakefield, the first manufactured goods except lumber ever shipped from that point.

The Battleford *Herald* says the Prince Brothers have removed their saw mill machinery to the banks of the Saskatchewan, to save the haulage of logs from their rafts.

Mr. H. R. Archer, of Newbury, Ont., is reported to have sold two hundred acres of timber lands, concession one, Mosa, to saw mill men of Chatham, for eight thousand dollars.

Mr. Menno Bechtel's saw mill, planing mill, bolt heading and cheese factory at Wellesley, Ont., was recently moved from its original site to a new one near the edge of the mill dam.

B. Caldwell & Sons saw mill at Wilbur Station, Ont., has been shut down for a few weeks for the purpose of having some repairs made before starting the shingle mill for the winter.

H. McCrae & Son, foundrymen and machinists, Tilsonburg, Ont., have received a large order from the London Pottery Co. for machinery for the pottery the Company is erecting in London

One hundred and seventy vessels loaded with deals in Miramichi this season, of which sixty were British, fifty-seven were Norwegian, and the balance were distributed among various nationalities.

Messrs Lord & Hurdman, lumber merchants, of Ottawa, shipped to their shanties on the Kippawa a few days ago two car loads of shanty teams, which will be used in finishing up the season's work.

The Rathbun company having completed the work of surveying the Napanee and Tamworth Railway, Mr. Butler, the engineer, will at once commence the survey of the Gananoque and Perth railway.

Messrs, John Bertram & Sons, Dundas, lately cast a bed-plate thirty-six feet long for a planing machine which is designed to take in work six feet square. Between eight and nine tons of iron were required for the casting.

Alex Fair's saw and shingle mill, at Omemee, with a lot of shingles and lumber, was destroyed by fire recently. It was by sharp fighting that the flour mill near by was saved, The cause of the fire is unknown. Loss about $5 000; no insurance.

The greatest portion of last season's cut, at Ottawa, has been disposed of. Stocks are about the same as during the same period last year. Prices, if anything, are a little stiffer and the sales to English dealers have somewhat increased. The outlook is regarded as favorable.

A lumber mill owned by Warner, Purves & Snearer, located at Pleasant Point, N. B., above the falls, has been burned with about 5 000 feet of lumber. The mill was valued at $20,000 and there was an insurance of $10,000 upon it A lamp upset in the engine room and set fire to some shavings. Burns the watchman was cut off from all communication and was rescued in a senseless condition. The mill was partly destroyed in 1872.

It is reported that a local syndicate has sold to an English syndicate the Hastings mill property at Burrard Inlet, B. C., for $300,000. The property was three years ago purchased from Heateley & Co., of San Francisco, for $265,000, and now includes a large portion of the Vancouver town site.

A correspondent writes from Folger's Switch, Ont: There is a good opening here for a steam saw mill, it being close to the railway with a large section of country lying north and west of this place, full of pine and cedar, that could be hauled to the switch in the winter if there was a mill there to cut it.

In a discussion of the Port Arthur Board of Trade upon the best means of saving the pine timber burned over in forest fires this year, it was stated by a large lumber operator that one hundred million feet of pine had been so burned over and if not cut down the present winter, would be ruined by worms next summer.

Mr George H. Bailey late of the firm of J. R Booth, lumber merchants, of Ottawa, and Mr. V. Holbrooke, son of Mr. G. M. Holbrooke, of the same place, have opened extensive lumber yards in LeSuer, Minnesota, and are doing well. The many friends of Messrs. Holbrocke & Bailey will be pleased to hear of their success.

A gentleman down from the lumbering districts of the Upper Ottawa says everything is rushing in the log-making and drawing line. The only complaint seems to be that the ice on the smaller lakes is anything but good. This is attributed to the heavy fall of snow which took place immediately after the lakes were frozen over.

A veteran saw mill man remarks that the more work you can put on a small piece of wood the more money you make. The man who cuts and hauls logs by wagon to the mill hardly earns feed for himself and team. The man who saws the log into rough lumber barely makes wages for the hands. The men who works the lumber up into finished stuff can have a pretty good chance to make a profit.

Permits to take out ties and wood in Ontario along the C P. R. have been granted by Crown timber agent Margach, of Port Arthur, to the following Winnipeg parties: Dennison Bros., whose permit covers the district from the Manitoba line east to Eagle River; Egan Bros, to cut 125 000 ties in the district extending from English River to Savanne. The H. B. Co. are also applying for a permit to take out a large number of ties.

A Calgary, N W. T., dispatch says: The Eau Lumber Company have given a contract for a million feet of logs to be cut on their limits by the proprietors of the Kanauaskis lime kilns. The company's saw mill at this point is nearing completion, but they will not likely begin sawing for the market till the spring comes in. Those who have visited the mill recently have been struck with the solid manner in which the structure has been put up. The large engine room is of sand. stone on a granite foundation, and is built to last no end of time. It gives accomodation for a large 120 horse power engine and three huge boilers. It is improbable the company will keep as many as fifty hands about the mill when active operations begin.

Messrs Duncan McArthur, W. R. Allan, F. A. Fairchild, R. D. Bathgate, Archibald Wright and C. W. Betts all of Winnipeg, app y to the Governor-in-Council for letters patent incorporating them, a body corporate and politic under the corporate name of "The Rocky Mountain Mining and Lumber Company (Limited)," for the purpose of carrying on a mining and lumbering business within the Dominion of Canada, also for the purpose of the said company, to build, equip and operate tramways, sailing and steam vessels for the carriage of lumber, timber, minerals or mineral ores or any other production by said company; to purchase build and erect stamp mil s, saw and planing mills, or any one or more thereof. The head office of the company will be at Winnipeg.

A Point Wolf, N. B., correspondent of the Albert *Maple Leaf* writes: Perhaps a few items in reference to the lumbering operations carried on here by C. M. Botwick & Co., of St. John, would be acceptable. I would say that their mill commenced sawing May 15 and shut down Dec. 3. In that time 5,000,000 feet of deals and boards were sawn and 4 000 000 lath cut. The deals have all been shipped to St. John for reshipment to Europe except 500,000 feet which are snugly piled in the lumber yard. The boards, scantling and lath were sold in Boston and New York. There are about 1 000,000 feet of old logs in the pond and streams, which would have been cut also if there had been good river driving in the early autumn. This mill, which is said to turn out as good lumber as any on the Bay shore, is driven during spring and autumn by water, and during the dry season by steam, having a 50-horse power engine for that purpose. The following are some of the efficient men employed: James Campbell, general manager; W. Rattray, engineer; A. H. Nash, millwright; Nathan Cleveland, filer, and William Hubbard surveyor: The company has a large store here in connection with the business, over which W. M. Fowler has charge. Good wages are paid the millmen for which they can take goods out of the store or receive cash. Robert Connely has the contract for putting all the logs into the stream and he intends getting out 5,000,000 this winter for next summer's sawing.

Mr. Campbell, manager of Tilly's saw mill at Kingston, had one of his fingers cut off a few day's since.

The Rathbun Co., of Deseronto, intend lighting the steam barge Resolute with electric light next season.

It is rumoured that Conroy's mill at Deschenes will be worked again next spring. It only operated about two weeks of last season.

A man named Nomoenda, from New Brunswick, while engaged in felling a tree on the timber district of Booth and Gordon, on the Indian River, was seriously injured by a falling branch. He was taken to the Pembroke Hospital.

It is reported that several Tonawanda, N. Y., parties have purchased a large tract of pine in Pennsylvania, with a view of railroading the logs to Tonawanda for sawing They think they can save money on the cost of Michigan lumber.

A number of teams recently left Ottawa for the shanties to engage in drawing, the ruling price being $1 50 per day. They went to work for Messrs. Bronson, and Perley & Pattee, the teams for the latter going to the Montreal River.

Messrs. Grier & Co's new saw mill at the Chaudiere is progressing very favorably. The stone work is almost completed and work on the body of the building will shortly be commenced. The mill will be finished for the spring and ready for work.

A terrible accident occurred on Lake St. John, Jan'y 18th, Saguenay County, A large gang of lumberers were crossing the ice, when some twenty of them broke through. All were saved but two men named Whitton and Ryan, who were drowned.

The lumbermen in northern New York say that this is the best season for logging they have known for years. It began in November, and there had, up to recent date, been no interruption by bad weather. Some loggers will have their jobs complete by February 1st.

John M. Holliday, well known in the Chicago lumber trade, died very suddenly in New York on Wednesday, 19th Jan. He was connected with the firm of Cutler, White & Boice, and had been with that concern and its predecessors, Ferry & Brother, for the last ten years.

A car-load of grist mill machinery was shipped, some little time ago, by Mr. W. H. Petrie, of Brantford, to Soda Creek, British Columbia. He is now about to fill an order for saw-mill machinery for the same neighborhood. This machinery is transported overland in waggons some 400 miles after it leaves the C. P. R.

It is understood that the prices paid for Messrs. W. G. Ross and Son's spruce deals by Messrs. Dobell, Beckett & Co are, $40 for 1st, $22 for 2nd, and $20 for 3rd; it is not known whether charges and insurance are to be added. However, as these prices are net 1st May there would seem to be no charge for insurance on the buyers.

A Bay City firm is getting out oak timber in Huron county, which is being delivered at Kind station, and is destined for the Quebec market, and some of the pieces are of mammoth proportions. One stick recently delivered says the local paper, scaled 3,500 feet, and required five yoke of cattle to draw it. Very few people supposed that there was any oak timber in Huron county, which was worthy of mention.

It is understood that Messrs. J R Booth & Co. of Ottawa, have petitioned the Government to locate a light-house in South East Bay, Lake Nipissing, claiming that it would prove of great advantage to lumbermen. No action in the matter has yet been taken. The Marine Department proposed to erect two lighthouses in South Bay, on the same lake in accordance with the report of the Chief Engineer of the Department.

A Deseronto despatch says:—Continued cold weather since the first of December put the swamps in good condition for seven inches of snow which fell in this section about December 20, and 10 inches more on January 1. Help is plentiful, and wages range from $11 to 16. Hay and grain are very cheap, and logs should be put in at low figures this season About the average amount of logs will be got in. Dry lumber is scarce and prices firm for all grades.

A dispatch from St John, N. B., under date, Jan'y 18th, says:—A number of disasters to St. John vessels are reported to-day. The Schooner Speedwell ashore at Moosepeckieme is full of water. She was bound from St. John to New York with a cargo of 109,000 feet of boards, shipped by Messrs. Driscoll Bros. The schooner Afton, from St. John to Portland Me, went ashore during a storm at Cranberry Island, but there is a probability of her coming off again. Her cargo consists of 40,000 spruce boards. The barque Gunanilo, Capt. Oretto, which cleared at St, John, Nov. 13, for Penarth Roads, is supposed to have been lost. The Guanilo had on board 332,749 feet of deals, 33,562 feet ends and 47,096 scantling, shipped by Messrs. Stewart. Capt. Stuart, of the ship John McLeod, relates a terrible experience of his vessel in the China Sea in a typhoon for three days, The ship lost all her spars and nearly all her rigging. Although a new ship and perfectly tight there were four feet of water in her hold when the storm ceased.

RAILWAY LINKS.

GRAND TRUNK NEW SCHEMES.

THE tunnelling of the St. Clair River and the building of the Sault Branch are two such important schemes in connection with the Grand Trunk Railway that the following extract from Sir Henry Tyler's address at the last half-yearly meeting, referring to these subjects, will be read with interest :—

"There is another item of expenditure which I ought to mention, and which I have already told you of, and that is the tunnel under the St. Clair River. You are aware that we have a ferry at the foot of Lake Huron between Point Edward and Fort Gratiot, near Sarnia, which works very well, where we have very large steamers and where we carry the trains over, but of course it would be better if we could carry them through a tunnel for many reasons and it would save a very large amount every year. I told you we had found a point on the St. Clair River with Chicago and Lake Huron on one side, and opposite the Sarnia branch of the Great Western section on the other side, and it is comparatively a small work to join those two lines by a tunnel under the river. The river is only 36 feet deep, and according to boring the rock is 90 feet below the surface of the water. The distance under water is only half a mile, and the tunnel will only be a mile long altogether, including approaches on both sides, and the piece of line, including the tunnel for connecting the Chicago and Grand Trunk with the Great Western section, will be only 2¾ miles long. By making that line we shall save six miles in distance, and we shall save £10 000 a year, even if the tunnel cost as much as £400 000 to make it. It is, therefore a very desirable thing to do. We have taken borings at an expense of four or five hundred pounds upon it, but we now propose to thoroughly test it before any expense is incurred, and to make a driftway six feet in diameter under the river; and an American contractor, General Suez Smith, has seen Mr. Hickson, and he is ready to undertake that work for $59,000, assuring its completion, because he is perfectly satisfied—having examined the spot, and being accustomed to work of that description—he is perfectly satisfied that he can do all we want in making the driftway and completing it in eight months for $59,000—something under £12 000—and we propose to expend that, but that will not make much of the three millions up. Now, there is another matter which I ought to mention to you, although it does not involve any immediate expenditure. I should mention that as far as that tunnel under the St. Clair River is concerned that we shall not come to ask you for the money for that. That is to say, it will not require to be taken out of the Grand Trunk resources, because if the tunnel is made it will be a very valuable property. It will have its own traffic to depend upon, and, like the International Bridge, it will have its own revenue, and there will be no difficulty in raising the money to make that tunnel without going upon the resources of the Grand Trunk Company. The next thing is the line which has been proposed for some years to connect our Midland system with Sault Ste. Marie. Sault Ste. Marie is a very interesting spot. The falls of Ste. Marie are those which take the waters from Lake Superior to Lake Huron. At the Sault there is a lock to avoid the rapids, by which steamers from Lake Superior go to Lake Huron and *vice versa*. There has been a Canadian charter for making a bridge at the Sault for some years, and a charter for making the line of the Midland system up to that place, and both charters are in the hands and under the control of the Grand Trunk Railway. There are also indications of lines being made to connect the Northern Pacific with the Sault Ste. Marie. Mr. McMillan, who is a friend of ours —a wealthy man in Detroit—had the line in his control there for a length of time, and by connecting the line with the Canadian Pacific, and having Ashland at the other end, that will complete the communication between Sault and the Northern Pacific. You will understand that a line connecting the Northern Pacific with the Grand Trunk will be a line of very great importanee. Here you have, on the one side, the Northern Pacific, with 2,000 miles of lines, connected with 1,500 miles of the Grand Trunk on the other side Any connection between those systems must be a very important connection. You will be very glad to hear that the Northern Pacific looks upon it with greater favor than we do. They say that the Northern Pacific and the Grand Trunk are natural allies, and that before long we must manage to get communications made between them somehow or other. Do not suppose I am contemplating this in opposition to the Canadian Pacific. This is a matter which has been contemplated by us for years. We have not been able to stir in it in times of depression, but we have gone so far that surveys were made years ago. It is an old project, and a very important one, and I am not prepared to go further in it than to say that we are negotiating with the Northern Pacific, and they are considering the question of making a line on their side, and we shall have to consider the question of how to make a line on the other side. I do hope we shall be able, the line being such a very important one, to make it with its own resources and without troubling the Grand Trunk with any guarantee. I am not prepared to say anything more at present."

The vote in Guelph on the by-law to grant $175,000 to the Guelph Junction Railway, which will afford the Royal City competition, was carried by a vote of 745 to 144.

The *Manitoban* thinks that sufficient evidence that the Hudson's Bay Railway is to be built is seen in the fact that several new freight cars have arrived at Winnipeg from Montreal, lettered "Winnipeg & Hudson's Bay Railway" and loaded with steel rails for the company.

The *Railway Age*, an American journal, says :—"The Canadian Pacific management has completed arrangements with the Boston and Lowell road, by which its cars will run to Boston, making that city, it is stated, its principal water terminus. Next summer it will probably reach down the coast into Florida, and perhaps throw a bridge across from Key West to Caracas, from whence the occupation of South America will be easily accomplished."

The Maskinonge and Nipissing is chartered to build 350 miles from Louisville, Que., on the Canada Pacific Railway, westerly to a point on the shore road, at or near Lake Nipissing. This, it is said, will shorten the distance for North-West traffic to Quebec about 200 miles. The country through which the road will pass is, in a large measure, heavily timbered, and iron, plumbago and building stone are reported at various places in large quantities. The incorporators are Messrs. Thos. W. Ferry, Grand Haven, Mich.; James J. White, Ottawa; John H. Verrall, and E. H. Talbott, Chicago.

Judging by the number of applications for new charters and extensions of old ones, the Dominion Parliament will have a great deal of railway legislation to attend to at its next session. The Railway Committee of the House of Commons, to which is committed the work of examining the bills in detail and checking, where necessary, legislation calculated to interfere with existing rights, is one of the largest and most important of all the Standing Committees of the House. It is made up of the best representatives of all sections, and probably meets oftener and works harder than any other committee —*Railway Life*.

The Oshawa *Reformer* says :—"The best railway project we have yet heard proposed in the interests of the town is that in which some of our citizens are now moving for the construction of a railway from the Oshawa harbor to Bobcaygeon, in the heart of the lumber region, with power of extension to Kinmount and thence in a due line north to Calendar station on the C. P. R. at Lake Nipissing. This line will cross the ridges and the C. P. R. at a very favorable point, a little east of Raglan and will run south and east of Lake Scugog, through Cartwright and Manvers, along the wide and fertile valley of Pigeon creek to Omemee and thence to Bobcaygeon. It will connect with the C. P. R. and Midland systems, and passing through good territory in the counties of Ontario, Durham, Victoria, Peterborough and Haliburton will enlist in its favor the parliamentary representatives of these counties and will receive municipal bonuses and command grants from both governments."

The Montreal *Star* says :—The decision of the Supreme Court in favor of the Canadian Pacific Railway regarding its right to complete the extension between Port Moody and Vancouver has, according to the British Columbia papers, given a great impetus to the terminal city. The real estate market has gone up with a boom, and capitalists who were holding on until a decision was arrived at are now investing heavily. The company has already asked for tenders for the grading of the uncompleted portion between Port Moody and the terminus, and the early completion of the railway will doubtless increase the population and bring a large volume of trade, both transit and otherwise, to the terminal city.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. Patent Office, January 11th, 1887, is specially reported by Franklin H. Hough, Solicitor of American and Foreign Patents, 925 F. Street, N. W., Washington D. C., who will furnish copies of patents for 25 cents each :—

356,066,—Moulding and stave machine,—C. L. Goehring, Allegheny, Pa.

355,704,—Saw Coping,—C. Morrow, Kansas City, Mo.

355,708,—Saw-Drag,—D. M. Omwake and W. P. McGee, Manchester, Iowa.

356,082,—Saw-guide,—D. J. Murray, Wausau, Wis.

356,035,—Saw-mill Band,—M. Garland, Bay City, Mich.

355,692,—Saw-set,—C. C. Harris, Denver, Colorado.

355,912,—Saw-swaging machine—W. G. Baumgardner, Flier City, Michigan.

355,059,—Saws, device for dressing the teeth of,—G. W. Cutshaw, Bedford, Ky.

355,710,—Shingle-sawing machine.—W. J. Perkins, Grand Rapids, Mich.

356,098,—Boring wood or metal, machine for,—H. F. Bundy, Welcome, N. Y.

356,220,—Saw mills, Saw-catcher for band,—G. H. Zschech, Indianapolis, Indiana.

356,086,—Sawing-machine, Scroll,—H. L. Beach, Montrose, Pa.

356 280,—Sawing wooden gutters, Machine for,— E. E. Elder, Lynn, Mass.

356,286,—Wood Machine for cutting across the grain,—F. Mankey, Williamsport, Penn.

354,256,—Chuck, Lathe,—A. H. Stetson, Brookline, Mass.

354,266,—Log Roller,—L. G. Orme, Paducah, Ky.

354,325,—Saws,—J. R. Little and C. T. Stoddard, West Stewardstown, N. H.

354,407,—Saw-mill, Band,—J. L. Gage, Chicago, Ill.

354,207,—Saw-mill dog.—J. C. Miller, Dunkirk, Ohio.

354 114,—Saw-swage,—J. E. Emerson, Beaver Falls, Pa.

354,167,—Saws, Device for setting,—C. Morrill, Jersey City, N. J.

HOW THEIR MONEY IS SPENT.

The *Paper Trade Journal* publishes the following illustrated table, showing how United States money is spent, as shown by the official statistics for 1885. We would be sorry to see such a record in Canada :—

Liquor, $900,000,000.

Tobacco, $600,000,000

Bread, $505,000 000.

Meat $303,000 000.

Iron and Steel, $290,000,000.

Sawed Lumber, $223,000 000.

Cotton Goods, $216,000,000.

Boots and Shoes, $196 000,000.

Sugar and Molasses, $155,000,000.

Public Education, $85,000,000.

Home and Foreign Missions, $5,500,000.

In round numbers three billion four hundred and eighty-two million five hundred thousand dollars, ($3,482 500,000,) divided as above.

The above figures show that our liquors cost nine hundred million dollars ($900,000,000.)

One-eighth more than all our meat and bread.

Three times as much as our iron and steel.

Ten times as much as our public education.

Our tobacco costs six hundred million dollars ($600,000,000,) or

One-fifth more than our bread.

Twice as much as our meat and iron.

Three times as much as our boots and shoes.

Seven times as much as our public education.

Our liquors and tobacco cost one billion five hundred million dollars ($1,500,000,000,) or

Three times as much as our bread.

Five times as much as our meat and iron.

Seven times as much as our meat and lumber.

Seventeen times as much as our public education, and these two items alone cost more than four-fifths of all the rest.

OUTLOOK FOR THE LUMBER TRADE.

THE local lumber market in Ottawa at present is very quiet, and for the past two weeks there have been no shipments of any account. The amount of dry lumber here is small in proportion to the cut. Mill owners are very firm in prices, all asking an advance and in some cases a large advance in prices on last year's prices. On the other hand buyers are holding back and do not seem at all anxious to buy. The amount of lumber sold of the new cut up to the present date is very much less than that at same date of the previous year's cut. Buyers are not inclined to close at prices asked, and therefore shipments are slow. Another great hindrance is the scarcity of box cars.

OUTSIDE ADVICES.

The Montreal *Trade Review* says : "There is a better feeling in New York than has prevailed for some time past. Stocks are held firmly. Trade with the British West Indies is quiet, and with Africa and Australia it is dull. There is a marked improvement in the River Plate trade. There has been further charters. In White Pine the new year opened near the zero line, and Jack Frost holds a tight grip on boom stock. The demand is comparatively light, but as the season advances a good trade is anticipated. Winter rail rates render it uncertain what the cost of transportation will be, for railroad companies have a happy faculty of weighing all the snow and ice which accumulates during a passage through several states; and, as this stock is necessarily shipped on open platform cars, the difference in weight is no inconsiderable factor. The arrivals of spruce have been light. There are but few cargoes on the way, and there are no orders; and will not be thrown upon the open market. Prices which remain unchanged are purely nominal, as there is little or nothing done. Laths show a decline of five cents since our last. The market for yellow pine is decidedly firm in tone. A better feeling prevails, and a further advance is not unlikely. For foreign shipment the inquiries continue to be large, and southern mills are stiff in their holdings. Many of the railroads are in the market with schedules of all sizes, some of them for large quantities."

WANTED.

The publisher of the CANADA LUMBERMAN desires thoroughly reliable and competent correspondents at the following named places :—

Kingston, Ontario.
Quebec City, Quebec.
St. John, New Brunswick.
Halifax, Nova Scotia.
Winnipeg, Manitoba.
Victoria, British Columbia.

The duty of each correspondent will be to give a review of his local market for the month preceding the date of issue, and the ruling quotations for different kinds of lumber, &c. For terms and any other information, address

A. G. MORTIMER,
Peterborough, Ont.

TRADE REVIEW.

TORONTO.

From Our Own Correspondent.

TORONTO, Jan. 24th, 1887.

Regarding the Toronto market, trade has hardly begun for the year. The cold weather with so much snow has prevented anything like outdoor work and consequently building has been almost entirely suspended. The recent thaw has, however, given a start to some work, and the indications in all sections of the city are such that just as soon as the weather permits there will be a considerable amount of building done.

The class of buildings to be erected this year are very various. Dwelling houses, factories, warehouses, banks, churches, possibly a City Hall and certainly the Parliament Buildings, although the latter will not be completed for three or four years to come.

The feeling in prices is to firmness and possibly before very long an advance in some lines. Certainly bill stuff will be in demand, and in this connection hemlock should prove an important factor.

The N & N. W. R. R. has, during the past ten days, been in rather a demoralized state. What with the burning of their round-house and several engines at Allandale, the snow blockade, and the scarcity of coal, they have not been able to move much freight in the way of lumber These are items even the C. P. R could not say they are, or would be, proof against.

The following are the ruling quotations in this city at present :—

Mill cull boards and scantling	$10 00
Shipping cull boards, promiscuous widths	12 00
" stocks	13 00

MONTREAL LUMBER MARKET.

MONTREAL, Jan. 25th, 1887.

The year opened very satisfactorily for the lumber trade, and the distribution to date shows a considerable increase over the corresponding portion of last year. Country business in the middle of the month was very slow, owing to the heavy snow storms which blocked up the roads; however it has improved somewhat latterly, and there is a good demand at the yards, and for carloads also. Prices remain steady and unchanged.

The following is a statement showing the value of lumber, etc., exported from Montreal during the past year :—

Logs	$ 3,950
Deals	2,008,193
Planks &c	81,007
Square timber	4,800
Other Lumber	6,746
Total	$2,104,696

Montreal has every reason to congratulate itself on the enormous proportions which its lumber business has assumed in comparison with past years. At the first meeting of the new Board of Trade held on the 12th January, the report of the Council recommended to the attention of their successors the necessity for an extension of wharf accommodation and wharf facilities This, it was stated, would be greatly beneficial to traders in the lumber business, which was increasing so rapidly. As an example of the volume of this trade, it may be stated that the shipment of deals to Great Britain the past season was largely in excess of any previous year. During open water of 1886, 45,594, St. Petersburg standards were shipped, against 39,393 standards in 1885, and 23,368 standards in 1884. The shipments of sawn lumber which is principally to South America, was also very large, although not quite up to the year before in volume; the figures being 28.912.376 feet last year, against 37.162,100 feet in 1885. It appears that in 1877 only ten vessels left port with 3,400,000 feet; in 1884 there left, for South America alone, 47 vessels carrying 24,386,373 feet, and for Europe over 100 vessels carrying 76,873,578 feet; and in 1885 there were 84,282,275 feet exported to Europe. Hence the necessity for something substantial in the way of increased wharfage to be done at once,

Messrs. Dobell & Co., of Liverpool, in their monthly timber circular dated, Liverpool 1st January. say: "We have had a heavier import during December than last year, but considering the intervention of the holidays, the consumption may be regarded as satisfactory, and the stocks held, though ample for the trade doing, show a considerable reduction on previous years. If a satisfactory settlement of our home politics be arrived at without reverting to a general election. and the immediate future of the peace of Europe be re established, we think we may look forward to the year we have just entered upon with confidence."

CHICAGO.

JAN. 22nd.—The condition of the lumber trade at large is mainly indicated by a firm holding of stocks, and a confidence that the outlook is favorable for spring trade. Actual business in the way of sales and distribution is mostly confined to railway stuff from the mills, and car strips from the yards and mills. The wholesale dealers are now looking after stocks of logs and lumber at the mills—that is, such of them as do not depend on buying by the cargo after the sawing season opens.

The season thus far has been very favorable for logging, and from every point, where active operations are being carried on, some predictions that this season's input will be unusually large. There may be conditions hereafter adverse to the successful finish of the logging season, but the probabilities are that there will be no lack of food for the mills next season, and that the supply will be so large that it will induce the crowding of production.

SAGINAW VALLEY.

LUMBERMAN'S GAZETTE OFFICE,
BAY CITY, Mich., Jan. 24, 1887.

Owing to the exceedingly heavy snowstorm, which impeded work in the woods, and was followed by three days of almost uninterrupted rain, the average lumberman in the Saginaw valley has endeavored to content himself by settling quietly back in his chair, and casting care to the dogs. He has not been annoyed by proposed purchasers, and in this has not been disappointed, for the reason that he did not expect to see any of them. He has therefore had plenty of time to "sum up the situation" as it were, and draw his own conclusions. The result has been that he finds himself in a very good-natured frame of mind; because as he sees fit to express himself, the outlook for business in 1887 is of the most assuring character. The business skies are full of promise, and there is almost a certainty of such a demand as will insure against any break in prices; but it is not at all improbable that there will be an advance. With such a prospect it is no wonder that the manufacturers feel sanguine, and are disposed to await the arrival of buyers with the utmost display of equanimity.

LIVERPOOL.

The new year of 1887 opens with a favorable stock sheet in all, except one or two items, and should there be any revival at all in trade the bulk of it must be right.

Quebec pine timber is in a position never before experienced in this market; the total of waney and square being 305,000 against 615,000 last year, and this, with a consumption considerably in advance, viz: 116,000 against 76,000, means that any demand at all for this wood during the next few months must reduce the stock to a mere nothing before the next import commences. Really good prime pine is especially scarce, and waney has gone very freely during the last month.

The principal movement lately has been in waney pine, of which about 100,000 feet has gone into consumption during the last fortnight, I notice also that the Quebec birch lately landed has been sold to consumers and also that sawn pitch pine has been going pretty freely from the yard. so that by the time of the new arrivals of the latter wood there will be very little of the old stock left on hand.

Pitch pine presents very startling figures, particularly in sawn, viz., 216,000 against 684,000 last year, and this with a consumption of 86,000 last month bodes well for the fresh arrivals, one or two of which ought to be close at hand.

Pine deals appear rather heavy, and as it always the case at this time of the year, the demand is languid generally, reviving in February. I hear that 3rds for next season are very scarce in Canada.

The severity of the weather recently experienced in this part of the country in common with other districts has had the customary effect of limiting the amount of business to a very narrow compass. Under the most favorable circumstances little is done in the market until this month is well advanced; and. therefore, no great amount of disappointment can be felt if the demand still appears to be limited.

One thing is certain, and that is that the upland carriers' wharves seem to have but small quantities on the way to country buyers, though this may be materially altered within a short time from the present. Sellers of most descriptions of goods are firm holders, and do not any longer appear to have that anxiety to push sales which has been a marked feature in their transactions during the past year.

The public sales of whitewoods held by Messrs. Alfred Dobell & Co., on Friday last, the 7th inst., drew together a good company, many consumers from the country being present, and, taking the proceeding as a whole, the result must have proved satisfactory.

The cargo of sawn pitch pine, per *Pegasus*, from Darien. was firmly held, although some prejudice might be held against it on account of it being the cargo of a vessel wrecked on the coast, but the timber itself had not been in any way injured. The balance withdrawn from the auction sale was readily placed by private treaty.—*Timber Trades Journal.*

LONDON, ENGLAND.

Timber says:—Our forecast regarding London trade we regret to say, has proved to be only too correct, as in addition to the troubles that have come to light between the above date and the end of the year, we have now to chronicle three further suspensions of considerable magnitude. The first of these, that of Messrs. P. Wyndham & Co,, became known on Monday; this was followed on Wednesday by that of Messrs. J. M. Ross & Co., and yesterday Messrs. Esdaile & Co. issued notice of a meeting of creditors. Of the two latter named firms one member of each is on the Council of the Timber Trades Association, one being the President, and the suspension of these firms naturally caused considerable excitement and comment in the Trade, the like of which has not been known since the sensation caused by the failure of Messrs. A. J. King & Co. some five years ago, It is, of course, more than probable that some minor suspensions may take place in connection with the three firms mentioned. This series of disasters naturally has a very prejudicial effect on the trade, and business in the meantime is well nigh at a standstill. In unsettled times like the present many wild rumours get freely bandied about; and although it is as well to treat all such gossip with the greatest circumspection, yet we fear we can hardly expect that we have not seen the end of the present troubles. Some firms must have difficulty in maintaining their position, as financial facilities are certain to be greatly curtailed until the effect of the recent difficulties has had time to subside.

GLASGOW.

General trade has this week got under way again after the pause for the new year holidays. No auctions are yet announced by timber brokers here, and business is felt to be quiet.

Some large railway contracts for oak planks were lately fixed: these goods arrived in parcels per steamers, from New York, weekly, form an increasing part of the wood trade. Last year's import of sawn wood per steam liners from the States was much larger than that of 1885. The stock of spruce deals on hand at present is small, especially in Lower Port, and there have been inquiries lately for spruce; of some special sizes wanted there were none in stock.

Deliveries of Ameri an deals and planks from Yorkhill Yards, Glasgow. in December last were 100 038 pieces; in November, 89.128 pieces; and October, 93 420 pieces; the average monthly delivery over the whole year was 71,100 pieces, so that the foregoing figures show a marked increase during the last quarter of the year.

A computation has been made of the tonnage of vessels at present being built in Clyde shipyards, and th- total is stated to be 114,755 tons. Some very important contracts were made within the last few weeks.

There have been no arrivals of wood goods to note at Greenock or Port Glasgow, and imports at Glasgow are only one Cargo, consisting of Dalhousie pine deals, &c., besides various parcels of wood per steamers from New York.

When opening a correspondence with advertisers always mention that you saw their advertisement in the "Canada Lumberman."

THE CANADIAN NORTHWEST.

GEO. W. HOTCHKISS, Secretary of the Lumberman's Exchange, recently returned from a trip over the Canadian Pacific from Winnipeg to Vancouver, and makes a report regarding the same, which will create surprise among those who have been in the habit of looking upon the Northwest territories as arid, desolate plains—the home of the blizzard, and the manufactory of snow. Mr. H. speaks of populous cities lining the route of this road, backed by a fertile wheat belt, already containing a very large population of prosperous, contented farmers. There are at least a dozen towns and cities with populations of from one to five thousand located on the first 300 miles of road west of Winnipeg. West of Qu'Appelle, three hundred miles out from Winnipeg, the country is better adapted to herding, and is the region into which many thousand of Texas and Montana cattle have been driven during the last three or four months. The feed is rich and the climate is moderate. The temperature in this region is caused by a steady, warm breeze, known, locally, as the Chinook wind, which rises near the headwaters of the Peace River, and blows steadily from the Northwest, throughout the length and breadth of the provinces of Alberta and Assinobia. during the winter months.

The Canadian Pacific has been open to the public for about six months, and runs one passenger train daily each way. Each train is fitted with Pullman sleepers, dining room cars. etc. The trip from Montreal to Vancouver is made in six days. The road does the bulk of tea carrying trade for the Canadas at very low rates, in order to divert the business in that direction. The management has been beset with, "it will never pay," "it is such folly," and such like encouragement that was provoked contemporaneous with the building of our own Union Pacific. Like our venture, this road, now that it is opened, promises from the start to be a monument to the enterprise of the syndicate who built it, and a gold mine to the stockholders,

Near Cochrane, seventy-five miles east of the Rocky Mountains, the Eau Claire Lumber Co. have just completed a circular saw-mill, gaining their supplies by Elbow river, from foot-hills south of the road. South of Cassils. twenty-five miles, is the mill of Louis Sands, of Manistee, which manufactured last year 2,000,000 feet of lumber.

From the Rocky Mountains to the coast, a distance of four hundred miles. there is little timber that is of value to lumbermen. The mountain sides are covered with a dense growth of fir. The line of road near the coast presents very little attraction to the lumber trade.

Vancouver island is covered with a dense forest of Douglas fir, similar to that of Washington Ter., and Oregon. This timber is interspersed with a small percentage of red cedar, of which Mr. Hotchkiss displays some beautiful samples.

All streams of the Western slope are gold-bearing, in connection with which will be remembered the Carribou mining excitement twenty years ago. This field being reached by the new road, is attracting a large number of gold hunters. Valuable quartz discoveries, both in gold and silver, are being daily announced. Vancouver, the Western terminus of the road in January, 1886, was made up of the Hastings saw-mills and complement of shanties. June 12th it had a population of 2,000. June 13th it was totally destroyed by fire and thirteen lives lost, by December 1, 1886, the town was rebuilt, and contained a population of 5,000.

Mr. Hotchkiss states that the low temperature of the Winnipeg region is accompanied by a dryness of atmosphere. which renders a forty-degree temperature more endurable than a zero atmosphere. It is evident that the hitherto prevailing opinion regarding the British possessions of the Northwest has been erroneous, and that this region is destined to reach a greater degree of development than has heretofore been considered possible. The railroad company received a grant from the British government of a strip five miles wide on each side of the road. They think much of the future of the country, as is evidenced by holding this land out of the market. All the improved farms are outside of this five mile limit. Timber land is worth from two and one-half to ten dollars per acre. The homestead laws are similar to those of the United States —*Saw-mill Gazette*

Esdaile & Co., extensive timber merchants and saw-mill proprietors, of London, Eng, have failed.

When the Hudson's Bay Railway is completed, it will reach latitude 59½ degrees, making it the most northerly railway in America. At present the Manitoba & North-Western claims that distinction, reaching almost to latitude 51, with a promise of reaching higher than 53 in a short time when connection is made with Prince Albert.

FOR THE RIGHT MAN.

WANTED—A trustworthy and pushing man to represent the CANADA LUMBERMAN on the road, capable of writing up the lumber and wood-working industries, solicit subscriptions and advertisements, and do general business. One acquainted with this branch of trade preferred. Must be perfectly sober and able to furnish good references. Apply personally, or address

A. G MORTIMER,
Publisher, Peterborough, On

MONEY to be made. Cut this out and return to us, and we will send you free something of great value and importance to you, that will start you in business which will bring you in more money right away than anything else in this world. Any one can do the work and live at home. Either sex: all ages. Something new, that just coins money for all workers. We will start you; capital not needed. This is one of the genuine, important chances of a lifetime, Those who are ambitious and enterprising will not delay, Grand outfit free. Address TRUE & CO., Augusta, Maine.

CHRISTIE, KERR & CO.

LUMBER DEALERS,

TORONTO, ONTARIO,

Office No. 9 Victoria Street.

WANTED.

A SITUATION AS SALESMAN, Inspector or in Office in connection with the Wholesale or Retail Lumber Trade. Have had several years experience in the Retail Trade, also in the Export Trade to Britain. Acquainted with the detail of R. R. and Ocean Freight and Shipping. Address Lock Box 33,

INGERSOLL, ONT.

YOU can live at home, and make more money at work for us, than at anything else in this world. Capital not needed; you are started free. Both sexes; all ages. Any one can do the work. Large earnings sure from first start. Costly outfit and terms free. Better not delay. Costs you nothing to send us your address and find out; if you are wise you will do so at once. H. HALLETT & CO., Portland, Maine.

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.

General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.
MANAGER—WILLIAM SMITH.

General Offices—Court St., Toronto, Ont.

Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from misrepresentations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.

MINING REGULATIONS

To Govern the Disposal of

MINERAL LANDS OTHER THAN COAL LANDS,

1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron, or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting, for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode, or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron, on veins, lodes, or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mines.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provide for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall, within sixty days thereafter, file with the local agent in the Dominion Lands Office for the district, in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt, it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operation on the same; but the claimant is required before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of same.

Not more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.—The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area, which shall be bounded by north and south, and east and west lines astronomically, and its breadth shall equal its length, Provided, that should any person making an application purporting to be for the purpose of mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The Regulations also provide for the manner in which land may be acquired for milling purposes, reduction works, or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected

PLACER MINING.

The Regulations laid down in respect of quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The regulations apply also to

RED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS.

Contain the *forms* to be observed in the drawing up of all documents, such as:—"Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location" "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed-rock Flume Company." "Grant for Drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulation to govern the disposal of Dominion Mineral Lands, the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

WORKING CLASSES ATTENTION! We are now prepared to furnish all classes with employment at home, the whole of the time, or for their spare moments. Business new, light and profitable. Persons of either sex easily earn from 50 cents to $5.00 per evening, and a proportional sum by devoting all their time to the business Boys and girls earn nearly as much as men. That all who see this may send their address, and test the business, we make this offer. To such as are not well satisfied we will send one dollar to pay for the trouble of writing. Full particulars and outfit free. Address GEORGE STINSON & Co., Portland, Maine.

VOL. 7. PETERBOROUGH, ONT., MARCH, 1887. NO. 3.

THE OPENING SEASON.

IF any value is to be placed on indications, an early and vigorous opening of the spring trade in lumber is one of the things that may fairly be expected of the near future. We find business starting up on every hand. Orders are beginning to flow in to the distributing markets, and these are but the precursors of the business soon to result from the flood of inquiries which wholesale lumber merchants have been getting for weeks back. Everywhere there is an anxiety to know about stocks and values—to feel the pulse of trade, and to measure, as far as it can be done, the resources of the country in the way of present supplies The strong feeling among holders, and the manifest rising tendency of values, contribute to produce a feeling of anxiety among those who are or must be buyers, and to hasten the placing of orders. The situation has all the buoyancy and strength which comes with an advancing market, and wholesale merchants have all the cheerfulness which comes from such conditions

In the outlook now spread out to the view of the lumber trades there is one feature that is frequently spoken of, always with more or less apprehension—the possibility of labor disturbances. The present strike along the docks in New York is pointed at as the probable beginning of a disturbance likely to extend into various lines of industry, and by reason of that possibility, forming an element of uncertainty that is necessarily disturbing and annoying. All calculations must be made with this possibility of labor troubles in view, and it must therefore prove a factor, whether it turns out only a bugbear or not. No one will venture an undertaking without regarding it, and without so carefully restricting his enterprise as to avoid, as far as may be, the evil consequences of such disturbances if they come To plan otherwise than this would be incautious and even dangerous in the extreme, and would be without justification in a management ordinarily careful

It is not improper to consider, however, whether the conditions actually existing may not be such as to warrant a hope, at least of a practical escape from any such upheaval of the labor element as occurred last year. Experience seems to show that strikes are less apt to occur when labor is generally employed than when there is a large contingent of idlers. If this be true, as a principle, there is some encouragement to be got from the fact that labor is pretty likely to have plenty to do during the present season and to that extent may escape the temptation to mischief which is always present when idleness abounds. Then the rate of wages is likely to be fair, and should be satisfactory. That it will be satisfactory, unfortunately does not necessarily follow. But this fact that men are averaging good pay, and stand in no peril of starvation, or of any hardship from insufficient means, will have some influence in keeping them from strikes, which many are beginning to learn are more costly to the working men than to their employers. If it were not for the labor unions, for the demagogues that control them, and for the principle they have established of ordering great strikes for merely revengeful and retaliatory ends, it might be safe to predict comparative immunity from labor uprisings during the present year. But these unlucky facts stand boldly out in the prospect, and makes the one great blot on the fair picture that would otherwise present itself.

But even with this possibility of a whirl with the trades unions to interfere with the perfect hopefulness of the outlook, the expectation of the business man, and especially the lumberman, is justifiably of a busy and profitable season. It will not do to scan too carefully all the dark elements in the problem, and ignore all the bright ones The chances that the wrong will not come uppermost are at least even, so that in discounting the future half the probability must be given to the other side. The unexampled health of the country in a business way must be given its due weight, and it is not to be forgotton that in especial the lumber businsss is in a condition of prosperity that has but few parallels in its history. It is to be remembered that there is in first and second hands but a limited supply of stock, and that among retail holders the supplies are proportionately even lighter. It cannot be therefore, but that every foot of dry lumber that is now in pile in the northwest, whether at mill points or in distributing yards, will be required to meet the actual consumptive demands of the spring and early summer. Such stock possesses for this very reason an intrinsic value that should be recognized and appreciated by every holder. Generally it is, and it is this fact that makes the present market so strong, and the rising tendency of prices so pronounced. If the trade does not take advantage of the present conditions, it will make the greatest mistake possible—one which the annals of the business have never recorded, and which it is to be hoped there will never be the necessity of placing therein.—*Chicago Lumberman.*

FOREST RESOURCES OF THE NATION.

THE following circular issued by the Chicago Lumberman's Exchange and approved by the Lumber Manufacturers' association of the northwest, has been sent out:

It is desired to enlist your sympathy and assistance in an endeavour to obtain an inventory of the forest resources of the nation. It is a work which can properly be accomplished only by the Forestry Division of the Bureau of Agriculture, and we learn from reliable sources that the amount allotted to that Division from the annual appropriation to the Bureau, is utterly inadequate to accomplish any useful purpose. It is desired that the Division of Forestry should place men in the various states, as rapidly as circumstances will permit, with instructions to ascertain: 1st. The amount of the various kinds of standing timber, classified. 2nd. The extent of the improved farming land—with such other useful information as may suggest itself to the Chief of Division.

And why is it desirable that this information should be obtained?

As a nation we are scarcely more than 100 years old, and yet in that time the forests of Maine, Vermont, New Hampspire, New York and Pennsylvannia have parted entirely with the vast supplies of white pine which once covered their forests, and their good oak is also gone. In these states only hemlock, spruce and hardwood, mainly of second growth, and of a vastly inferior grade as compared with the original timber growth, is to be found. Michigan which but 50 years ago was estimated to contain 150,000,000,000 (one hundred and fifty billion feet), is set down in the census report for 1880 at but 32,000,000,000 feet, while the annual manufacture equals 5,000,000,000 feet. Wisconsin in the same time has been reduced from an original supply fully equal to Michigan, to an estimate of 44,000,000,000 feet in 1880. Minnesota with an original growth of perhaps 30,000,000,000 feet, was in 1880 estimated at but 11,000,000,000 remaining.

These three last named states are supplying lumber at the ate of not far from 10,000,000,000 per year, and if the census estimates were reasonably correct, the year 1890 should show an almost entire extinction of the white pine supply of the northwest.

While perhaps the estimates were far too low, the poorer grade of the supply of each succeeding year is speaking as no figures can do of the fact that the pine supply of the northwest is drawing uncomfortably nigh to a period of utter exhaustion. Of oak, which for many years was a staple production of Michigan, it may truthfully be said that it has disappeared, for a while a large amount of inferior timber suited only for saw logs may yet remain, the seeker after staves and quare timber for ship building is compelled to look to other and more remote regions

The vast timber resources of states further south, as Ohio and Indiana, have been culled over until little is to be found except that which but a few years ago was rejected as of no value. With an average consumption demand equaling 500 feet per capital the 60,000,000 people of the United States require 30,000,000,000 feet per year of the sawed products of the forests, in addition to their fire wood.

How long the now extensive forests of the south can stand the strain, which (with a smaller population) has so nearly exhausted the once supposed inexhaustable forests of the north is an interesting problem.

Our Canadian neighbors who have been hitherto thought the possessors of unlimited forests of pine have already taken the alarm, and ascertaining that in eight years the timber trade of Montreal has increased from 3,800 000 feet in 1878, to over 100,000,000 feet in 1886, now propose to increase the export duty upon the manufactured product, in order to conserve and protect her forests from speedy extinction. Under these circumstances, is it not for the interest and advantage of every citizen of the United States, be he farmer, merchant, professional man or laborer, that a reliable inventory of the present and still remaining forests resources of the country should be speedily undertaken, in order that with an intelligent appreciation of the facts waste may be prevented and the commercial, agricultural and manufacturing interests of the nation, may, to the fullest extent be benefitted.

It is firmly believed that when the importance of the subject shall be appreciated by our legislators, there will be no delay in providing the bureau of forestry of the United States with ample means for inventoring the timber resources. To this end your influence and vote is requested.

Importance of Thin-Blade Saws.

The Germans use at the present day among their furniture-makers, carpenters and joiners, thirteen different varieties of saws, each one of which has its own peculiar size of the teeth, as well as a different relatlion of teeth to each other. How important the thin saw-blake is, not only as a means to save power, but also as a means to save wood, can be seen from the following: A log of walnut, four meteres long and one meter in diameter, cut into twenty pieces the new horizontal saw frame, saves thirty millimeters of wood when compared with the cutting of the old-fashioned vertical saw. This is equal to a profit of $9 to $12. For Germany, where annually 100,000 cubic meters of this wood is used in various industries, this would represent a saving of $37,500 to $50,000.

John W. Perry, Lumberman, Coles Island, has assigned.

CANADIAN WOODS FOR CARRIAGE BUILDING.

A COUPLE of months ago THE LUMBERMAN briefly referred to a paper read at a meeting of the Institute of British Carriage Manufacturers, by Professor John Macoun, Botanist to the Canadian Government, on the "Timbers of Canada suitable for Carriage-making" Through the courtesy of Mr. Macoun, we are now enabled to produce his remarks almost in full, and coming as it does at a time when the excitement of an election contest precludes any great amount of news concerning the lumber trade, we have no doubt but that one and all of our readers will feel a personal interest in the remarks of this talanted gentleman. Among those present at the meeting above referred to was Sir Philip Cunliffe-Owen, K. C. M. G., chairman), the Hon G. Quinett, (Canada,) Messrs. A Ransome, L. Ransome, Ira Cornwall, J. Burn, Bishop & Son, Allison, F. Joplin. C Chapman, A W. Wright, (General Commercial Agent for Dominion Government,) E. B Biggar, (New Brunswick,) G N. Hooper, and many others.

Professor Macoun, on rising, said: Gentlemen, although my remarks will chiefly refer to woods used in carriage building, I feel convinced that my audience will bear with me while I make a rapid sketch of the lumbering business and point out on the accompanying map the localities where it is chiefly carried on. New Brunswick, Quebec and Ontario are the chief seats of the timber trade, and there is not a river in these three provinces where a saw log will float but has its sawmills or its lumbering firms. In northern New Brunswick there are still extensive forests of maple beech, ash, basswood, birch, oak, poplar and elm, of very great size, besides large tracts covered with hemlock, black and white spruce, red and white pine, as well as swamps of larch and cedar. Owing to their positions these forests remain untouched, and when a projected line of railway is built, large supplies of timber for every branch of business will be laid open to commerce. I particularize this region because it is nearer the seaboard than any other untouched locality. At present spruce and pine, with a little ash, are the only woods exported.

Quebec has been exporting pine timber for generations, and still has very large quantities, but it is chiefly confined to the upper waters of the various streams entering the St. Lawrence. The same hardwoods which occur in New Brunswick are still in abundance, but are getting more difficult of access owing to the advance of settlement. Cedar, larch, and spruce are abundant, and were the demand greater there would be more produced.

Northern Ontario possesses the most extensive pine forests now existing in Canada, perhaps in America. These extend from the Ottawa river on the east to Lake Superior on the west, and lie on both sides of the Canadian Pacific Railway. West of Lake Superior there are extensive tracts covered with pine, spruce, larch and cedar, part of which is being utilized, while the greater portion is being destroyed by fire. The hardwoods mentioned as growing in the other provinces are more abundant in Ontario, and the species are in much greater variety. In the Ontario forest sixty-five species of trees grow in profusion, while in England only fourteen are found native.

A belt of timber composed of poplar, spruce and larch, and one species of pine (*Pinus Banksiana*), extends from the meridian of Lake Superior westward to the Rocky Mountains, with a depth of about ten degrees of latitude. This belt contains much fine timber, especially in the river valleys, part of which will find an outlet by Hudson Bay

The Rocky Mountains and British Columbia contain in their recesses the finest coniferous forest on the continent. This, if properly looked after, would be a source of profit for centuries but past experience tells me that a few short years will see only blackened stumps and fire-scathed trees, where the stately fir and cedar show their crowns of waving green as the breeze passes through their tops two hundred feet above the earth.

From the data just given, it can be easily shown that there can be no uncertainty about the supply. I am afraid that our people would cut down too much and have no profit on their labor. Were there a timber bureau or exchange organized in connection with the contemplated Imperial Institute, dealers might be made aware of the anticipated wants of consumers, and producers could be instructed accordingly. There need be no fear of the supply of spruce and larch, and of the courser kinds of pine lumber, giving out, as we have immense tracts, unfitted for agriculture, covered with this class of timber. It is true that fires do great damage every year, but that applies more particularly to pine forests, as these grow on dry and generally sandy soil. Fire passing through a Canadian forest simply means the re-covering of the land with a different variety of tree, as pine lands, if the soil be fairly good, seldom become covered with pines again.

I may be permitted at this stage to make a few practical remarks on forest conservation and practical forestry in general. The Imperial Parliament has taken up the matter of a School of Forestry for England, and much discussion has taken place regarding it, and much useful information has been elicited by the Parliamentary Committee appointed two years since. In looking over the evidence I was struck with the clear-sightedness of a number of the witnesses, though I could see that their environment was rather restricted, and their views partook of their surroundings. As I am acquainted with the conditions under which the 110 species of Canadian forest trees exist, flourish and mature, from the Atlantic to the Pacific, I may be permitted just here to make one or two broad statements. Before doing so, however, I may state that, should any gentleman desire it, I will give him, at another time, the soils, localities and atmospheric conditions under which each and every species flourishes in Canada. For over thirty years I have studied the flora and climate of Canada, and collected every species of tree in its native habitat so that answering questions as above requires no preparation.

Mixed forests are always the best in Canada when size of trunk is considered. Lumbermen prefer the pine to be in groves, as it costs less to get it to the water. No two species of tree have ashes containing the same constituents, hence the more diverse the ashes the better suited to plant together. Conifers produce little ash, but deciduous trees much; therefore I would mix by having say, a pine and an oak. The pine has a pyramidal top and grows faster than an oak, while the latter has a broad top and is slow of growth. Pine (*Pinus strobus*) and oak (*Quercus alba* and *rubra*) grow together in many districts of Canada, and both are very healthy. Larch requires undrained soil, and can thus resist a hot climate, but a constant supply of moisture at the roots or a cool moist atmosphere are its essentials.

Let me give you an actual forest picture, as seen in many districts in Canada. You stand on a hummock in the centre of a tamarac (larch) swamp, all around you are small larches, scarcely rising twenty feet above the swamp, which is composed of species of sphagnum and hypnum, and interspersed with ericaceous shrubs. Far in the distance you see trees of other kinds, and you walk towards them As you proceed the trees become larger and are soon of a merchantable size. Soon cedar (*Thuja occidentalis*) begins to mix with the larch, the soil gets firmer, the sphagnum disappears and you are in a cedar swamp. The larches are now very large. Still passing outwards a few black ash (*Fraxinus sambucifolia*) are met, and these soon predominate, and you are in a black ash swamp. Reaching almost dry ground you meet with soft maple (*Acer rubrum*) and American or swamp elm (*Ulmus americana*). These extend to the margin of the wet ground, and you now meet with beech, birch, maple, white ash, rock elm, and the various other hardwood species of dry and arable soils. In many cases this good land is traversed by ridges of gravel or gravel and sand, and here you will find oak and pine growing together, seldom the one to the exclusion of the other, in the central parts of Ontario; but north, only pine is found, and south, only oak in such places. These are the conditions under which a few of our trees live and go through their round of existence.

It is now time to come closer to the real object of the lecture and introduce what is ostensibly the subject of my discourse—'Canadian Timbers suitable for Carriage-building.' I have been permitted, however at a later stage, to make some remarks on species suited for other purposes.

List of elastic woods valuable for carriage building:—

1. Shell bark hickory (*Carya alba*).
2. Bitter-nut hickory (*Carya amara*).
3. White heart Hickory (*Carya tomentosa*).
4. Pig nut hickory (*Carya porcina*)
5. White ash (*Fraxinus americana*).
6. Black ash (*Fraxinus sambucifolia*).
7. Rim or red ash (*Fraxinus pubescens*).
8. Chestnut (*Castanea vulgaris*).
9. Cherry or black birch (*Betula lenta*).

I ELASTICITY.

Ash and hickory are noted everywhere for this property, but in commerce only two species are taken into account—White ash (*Fraxinus americana*) and shell-bark hickory (*Carya alba*). It is well known, however, that all the Canadian species of ash possess this property in an eminent degree, and both black and red ash have been used from time immemorial by the American Indians in the manufacture of baskets, on account of it. Red ash, or Rim ash obtained the latter name from the early settler in Canada, because, when hammered, each year's growth separated from its fellow and enabled the Indians to get the thin ribbon like pieces which they use in their basket work. Much has been spoken and even written on the great value of 'second growth' ash and hickory, yet a clear conception of what is meant seldom enters the mind. In England I have heard of the superiority of English ash as a species, but this I deny, and assert as a fact that it is due to the conditions under which it is grown. English ash is grown on lawns and in the hedge-row; ours, which reaches England in square logs, in the close forest, where it is protected from both storm and sunshine. Second-growth ash, on the other hand, is young timber grown in the corners of fences in the old settlements, or young forest growth which has sprung into existence since the old was cut or burnt away, and has been produced under the same conditions. The same remarks are applicable to hickory, and the wood grown in the old forest bears no comparison with the second growth.

I consider elasticity a property of young wood, and the greater the exposure the more it is produced Should this be a fact—and I have no doubt of it—there is no reason why Canada could not produce all the ash and hickory for every variety of agricultural implement and vehicle required in England. We have millions of acres of waste lands growing up with young wood, which to-day are of no value, but which in twenty years, if merely let alone, would fully supply the English market as well as our own.

LIST OF WOODS NOTED FOR TOUGHNESS.

1. Basswood (*Tilia americana*).
2. Common or white elm (*Ulmus americana*).
3. Rock elm (*Ulmus racemosa*).
4. Slippery elm (*Ulmus fulva*).
5. Beech (*Fagus ferruginea*)
6. Hornbeam (*Carpinus americana*).
7. Ironwood (*Ostrya virginica*).
8. Walnut (*Juglans nigra*)
9. Butter-nut (*Juglans cinerea*).
10. White oak (*Quercus alba*).
11. Blue oak (*Quercus bicolor*).
12. Pin oak (*Quercus palustris*)
13. Grey oak (*Quercus macrocarpa*).
14. Sycamore (*Platanus occidentalis*).
15. Red maple (*Acer rubrum*).
16. Whitewood (*Liriodendron tulipifera*).
17. Whitewood, Cottonwood (*Populus monilifera*).

II TOUGHNESS.

Toughness and elasticity, although often combined in the same wood, as in the various species of elm, are not necessarily produced under the same conditions. Elasticity, as I mentioned above, is a youthful state, while toughness is produced from the interlacing of the fibres, and is found at all ages. Our three elms, common or swamp elm (*Ulmus americana*), rock elm (*U. racemosa*), and slippery elm (*U. fulva*), are in their young state so tough that in many cases it is impossible to split them. I have seen thousands of young elms ranging from six inches to eighteen inches cut down close to our railways and burned up on the ground because they were so tough that they were almost useless for firewood, and not worth the labour of converting into firewood. Did English purchasers and Canadian producers understand their business better these small trees would be cut up in Canada of the required size, or merely cut into plank and shipped to England when partly dried. Or, better still, English capital, managed by competent men in the interest of the manufacturer or dealers in England, could produce just what was wanted and forward direct, so that the heavy charges now paid to middlemen could be dispensed with. I see no reason why Englishmen cannot look upon Canada as an integral part of the Empire, and place their money there with the same freedom they do in this little island.

Another tough and invaluable wood to the carriage builder is basswood (*Tilia americana*). Besides its lightness and easiness to work, it possesses the valuable property of retaining any shape required by the builder, and for the bodies and panels of carriages is unsurpassed. In both Canada and the United States it if considered a valuable wood for every purpose requiring lightness and strength. Our manufacturers use it for sounding-boards for pianos, as it will not warp, for chair bottoms, sleighs, fanning mills, and other purposes of a like nature. Bowls and woodenware generally are made from it, besides many toys and various little articles To the cabinetmaker it is also valuable, as it can be stained any color, and often passes for much more costly wood. Whitewood is also a valuable wood, but is becoming scarce in Canada as it is confined to the western part of Ontario, chiefly along Lake Erie. It has been asserted with much truth that Canadian oak is far inferior to English, but the fault lies more in the conditions of growth than in any specific distinction. English elm, ash, and oak are grown in the open ground, and hence are as tough as they possibly can be, while only the full grown forest tree is shipped from Canada. No trees of these genera are cut for export in our forests, except those that will square a certain size, and therefore the timber exported is our most brittle and weak. We have now in Canada around the old settlements, in fence corners, and in the forest, cut many years ago an enormous quantity of young wood ranging from twenty to sixty years of age which is considered of no value, as there is no demand for it. This is the class of wood you want and cannot get, because your own country does not produce enough of it. You reject our forest-grown wood and say it is of second-class quality, and tell us our woods are far inferior to yours. I retort by telling you that you can get the wood you desire by changing your mode of purchase Let any competent man go out to Canada and have a lot of young oak, ash, elm, and hickory sawed up into plank of the size you want, let it be partly seasoned, and then shipped direct to the manufacturer. Then you will get good cheap raw material, and with your machinery and skilled workmen there is no reason why you cannot build carriages of better quality more cheaply than you do at present.

So that you may understand the ignorance that prevails in Canada regarding our own woods, I will relate one or two instances of this character. Last autumn I was collecting samples of wood for the Indian and Colonial Exhibition, and went for that purpose to the Niagara peninsula. At Queenstown Heights I purchased a lot of second-growth hickory for hammer handles for the use of the Geological Survey, and at

Niagara Town, Clifton, and St. Catherines I found hickory almost the principal firewood, and piled up in every person's yard At the manufactories in St Catharines I learn they use imported hickory, and put their own in the fire, while west of them, on the line of the Canada Southern Railway, numerous sawmills were at work cutting hickory into spokes and hubs for the American market. I visited the mills myself, and saw them at work. One of the chief causes of our gross ignorance is the want of a Forestry Department and staff of competent men to enlighten the people. Each province owns its wild lands, and each settler his farm, and reckless waste and wanton destruction are the order of the day. The people are gradually becoming aware of the alarming waste caused by fire and the permanent change taking place in the climate. The probabilities are that the Dominion Government may take the matter up at an early day, and at least the worst features of the constant burnings be somewhat curtailed.

III. HARDNESS.

Nearly all the woods mentioned in the lists are hard when dry. Some of them are so hard that in daylight fire will be seen to fly from the axe when they are being cut for firewood. Ash, hickory, all the oaks, beech, hornbeam and ironwood become very hard when dry. Basswood, elm of the various kinds, willow, poplar, and some other woods, do not become so hard but they are very difficult to cut, as the axe will indent them but not start a chip, owing to their toughness.

IV. WOODS SUITED FOR CABINETMAKING AND FURNITURE.

In the foregoing remarks I have abstained from saying anything about the beauty of many of our woods and their great value for cabinetmaking and all kinds of furniture. Many woods, of great beauty for panels of doors and inside work in rooms, are to be had at a small cost in Canada. The more abundant of these woods are black ash, Douglas fir, black walnut, butternut, cherry, pine, cedar, birch, tulip-tree or whitewood, chestnut, white ash, maple, oak, sycamore, and some others. An examination of the articles of furniture, doors,&c., in the Exhibit on will illustrate this part of the subject better than I can, but these billets, which I now show you, will give you at least a faint idea of their varied appearance ond contrast of colours. The Douglas fir, is easily worked, and has that warmth of colour so admired in pitch pine, but is free from the resin that interferes with its working. Sycamore (*Platanus occidentalis*), black walnut, maple and ash are well known, and need only be mentioned; but one fact should not be lost sight of—that all these are easily worked, and of more value on that account. We have had logs of black birch, black walnut, black ash, basswood and slippery elm exposed to the English climate since spring, and there is not the least appearance of checking up to date in any one of them. This to me is a fact that should not be lost sight of, as wood that dries without a flaw ought to be good.

V. COOPERAGE.

Oak seems to have the first place for wine and beer barrels, and Quebec staves have held their own for many years Birch staves are found to be an excellent substitute for vinegar and many other barrels, and Mr. Ransome proved the other day that black ash is well adapted for the same purpose. Pine, cedar, and many other woods are suitable for dry barrels. In this line of business our easily worked woods are unapproachable.

VI. PULP FOR PAPERMAKING.

In conversation with a gentleman the other day, I discovered that large importations of wood pulp were being made from Norway and Sweden into England. Now, it may not be a surprise to any of my audience when I say that we have in Canada more land covered with poplar alone than the whole area of Norway, Sweden and Finland; that these poplar lands are in every province, and with the exception of the Northwest, are the poorest of the lands. As poplar (*Populus tremuloides*) grows rapidly, we can fill any orders that may be made upon us without exhausting the supply. Much of the spruce required for common purposes comes now from these same countries; and this, too, we can furnish, as a belt of spruce crosses the watersheds of all the rivers flowing into the Gulf and River St Lawrence and Hudson's Bay.

VII. DETERIORATION AFTER CUTTING.

Many trees, under certain conditions, rot easily, while under other conditions, they are almost imperishable. Basswood was early considered a poor wood for fencing, as it rotted so easily. Observation showed that with the bark on it soon rotted, but without the bark it remained sound. The same thing is true of elm, but in a lesser degree. Beech rots very quick if exposed to the elements, but under shelter remains sound. If covered by water it will remain sound for a long time. Oak, if exposed to the weather, loses its sap wood, but the old wood remains sound for many years. I believe all young timber should either be put in water immediately after it is cut or put under shelter, as the young wood begins to rot very quickly if it is alternately wetted and dried. It follows, then, that deterioration takes place to a far greater extent than we imagine by letting young trees lie out in all weathers with their bark on, as they cannot resist wet without having been first dried.

I believe that any attempt to ship our hardwoods to this country without a proper understanding of the subject will result in failure. Basswood sent to England in the usual way would be both an unsightly and an inferior wood, but if sawed into boards at once in Canada and dried would be both beautiful and of excellent quality. Its natural colour is a light yellow, but it takes a stain so easily that it can be made of any colour. Our practical men know the great beauty of our common woods, but few know how to treat them to preserve their strength and colour My own opinion is that only two plans can be adopted—soaking in water long enough to remove or change the character of the sap, or sawing up the wood into planks or boards and drying at once Unless this is done you cannot expect to get such stock as our local manufacturers use. Deterioration by discoloration or incipient decay, or even by fungus growth, can easily be proved to arise from decomposition or fermentation of the sap or the albuminious matter laid up in the wood cells for the next year's growth All the maples, birches, poplars, and lindens are noted for their loss of colour owing to these changes. The action of the winter's frost in the case of the maple changes the albuminous matter into cane sugar, while in the sap of the birch it produces grape sugar.

This would seem to indicate that the sap also undergoes fermentation when the tree is cut down and the logs are exposed to the weather. In removing the starchy matter from the cells we remove the chief cause of decay and of weakness, and must have a closer-grained, lighter, tougher, and more elastic wood.

By the present method of shipping square logs, one-fourth of the best part of the tree is left on the ground and another seventh is lost before it passes into the hands of the mechanic. In this way over one-third of the wood is wasted, and the old overgrown trees, with very inferior heartwood, are the only ones that reach the English market If the plan indicated above were adopted, half-grown trees, as well as old ones, would be taken and sawed at once to the required thickness or size. After rejecting the heartwood, bark, and other useless portions, a material would be left which all practical men can see must far excel that now sold on the English market. Beauty of grain, toughness, and elasticity are combined in the wood of young trees and hence such ought to be chosen, and their supply in Canada is practically inexhaustible.

In speaking to an English audience composed of practical men, I feel bound to show that the superiority of English woods is not due to any inherent quality, but merely to the fact that you take the best of yours and get the worst of ours. Give our woods, grown under the same conditions, and of the same age as yours, the same treatment, and I have no fear for the results. The ash and oak I saw in Mr. Lucas's factory told their own tale, the bark being just as sound as the wood, showing conclusively that it was sawed up shortly after being felled. To be of any real value carriages must be constructed of well-selected and well-seasoned timber, and to all desiring such I would say look to Canada for your raw material.

VIII. AMERICAN VIEW OF THEIR TIMBER SUPPLY.

We are threatened with a want of sufficient quantity of timber to meet the actual necessities of life.

Twenty millions of people are living in dwellings chiefly constructed of wood. Their barns and outbuildings are of wood, and the fencing of their farms, more expensive than their other improvements, is of wood, and all these are perishable with time. Moreover, our sixty thousand miles of railroad consume annually immense quantities of timber. Twenty-one thousand six hundred cords of wood are daily consumed in running railway trains three hundred and twenty thousand miles each twenty-four hours. Sixty thousand miles of road require twenty-five hundred ties to the mile, and as they must be replaced every five years an annual consumption of thirty million ties is required. We will soon construct each year ten thousand miles of new road equiring twenty-five million more ties, and when we add to all these sources of forest destruction the wood required in the fencing of these railroads, the half-million telegraph-poles which each year will be required, and the vast amount of the destruction of forests by flood or fire, we must be absolutely startled with the conviction that whole provinces of wood which have required a hundred years to grow are each year being swept away, while nothing is done by either public authority or private zeal to supply the place of that which is destroyed or protect in any measure that which exists. These are 'hard facts,' and whether people mind them or not to-day, they will give them some thought hereafter.

In France the forests were cut down with the utmost recklessness, and for the last thirty years her fertile valleys have been swept by terrible floods, carrying away all kinds of property and covering the rich soil with gravel and sand. In Russia the forests are beginning to disappear, and a law is now in force making it illegal to use anything but coal for fuel on the railroads.

The timber lands of Germany are under the special protection of the Government, while in Japan every one who cuts down a tree is compelled at once to plant another.

The experience of these countries foreshadows that of our thoughtless men, and reckless corporations may go on stripping the land of its forests, but at last every one will be convinced of the necessity for a change.

PRACTICAL VIEWS FROM NEW BRUNSWICK.

Mr. John D. Howe, of the firm of J. & J. D. Howe, furniture manufacturers, of St. John, New Brunswick, the designer of the magnificent wood trophy shown by the Government of New Brunswick at the Colonial and Indian Exhibition, says: 'Authorities differ as to whether our supply of what is generally looked upon as our marketable lumber is diminishing. Be this as it may, we still have enormous supplies of these woods. Independent of these it is a well known fact that immense tracts of our lands are covered with most valuable woods generally considered of little value, but which will eventually yield a more profitable article of export than either pine or spruce, as the latter are now handled. The poplar, white birch, basswood, maple, and other deciduous varieties of our forests if cut and shipped in the ordinary manner of shipping spruce and pine, would in most cases prove a failure. In order to make their export a success their nature and peculiarities must be well understood, and a desirable amount of intelligence and skill brought to bear in their manufacture. We might as well attempt to send away our grass or grain as we take them off the fields, without curing, as to export these woods without seasoning and manufacturing into desirable sizes or articles for which they are best suited. Our poplar, which is very abundant, is valuable for many purposes; it is very white in colour, and of light weight. It becomes hard and tough when dry, and is susceptible of a very high degree of polish. On account of the hardness of this wood it is considered superior to pine or spruce, where narrow stock is required, for flooring and other interior finish. It can also be largely used for cabinetwork, tool-handles, paper-pulp, and many other purposes.

'Basswood, like the poplar, is even more liable to spoil after the tree is cut down. Like all other vegetable substances, there is not any remedy for it after decay sets in. The early stages of decay, or souring of the sap, as it is called, should be carefully guarded against; it alike destroys the colour of the wood and the firmness of its grain. It destroys the qualities which render it so valuable for many purposes, such as carriage bodies, furniture, interior finish, &c. It takes walnut or mahogany stain equal if not superior to any other wood, and makes a pleasing finish in its natural colour—pale yellow.

'The white birch, although not so liable as the basswood, poplar, and maple to deteriorate while green, or before the sap or moisture leaves it, requires careful treatment in order to preserve its strength and colour. The many purposes to which this valuable wood may be applied are too numerous to mention. Large quantities are now being shipped to Europe in the shape of spool bobbins blocks, &c. It is becoming exceedingly popular for first-class flooring, and for this purpose should be cut on the *rift* rather than on the slash of the grain. Maple and beech are also excellent for flooring, but their chief value is for tool stocks and handles, agricultural implements, lasts, and an almost endless variety of articles requiring a strength and hardness that will resist wear.

'The preference given to English plane stock and tool-handles is not due (as the prevailing opinion puts it) to the material used by those makers being superior to ours. It is rather attributable to their proper method of treatment of it. The trees are cut down in the proper season, while the sap is down; they are then blocked out to suitable sizes and dried, not allowing the sun to check or dampness to heat or mould it. On no account is the log allowed to remain uncut for any length of time, either in or out of the water. There is not any class of woodwork where the proper cutting and curing of wood is of so great importance as in its preparation for wood-engraving. Our rock maple if prepared according to the foregoing observation, becomes dense and capable of receiving almost as large a number of lines to the inch as boxwood; in other words, it is suitable for fine work If the same wood was allowed to remain in bulk for any length of time, even in the log or plank, or (worse still) a close pile, it would become worthless for wood-engraving.'

Mr. Howe continues; 'It is to be regretted that the beauty and nature of our native woods have not been better understood and properly appreciated. This is probably due to their abundance, but it is not any reason why we should not make the most of what we have so plentiful. It is hoped that when it becomes apparent that we still possess a valuable supply of timber that it will not receive the same ruthless and greedy treatment that the pine, spruce, and hemlock have received in the past.'

In again referring to the proper preservation and seasoning of timber, while Mr. Howe's remarks apply to some lumber or material not exceeding three or four inches in thickness, the same cannot be applied to cases where it is used in larger bulk, as in the case of that used for shipbuilding. For these purposes another eminent authority says: 'The decay of woods by the growth of fungus, denominated dry rot, may be traced to the putrefying of the sap (as alluded to by Mr. Howe) when this has been left within the pores of the timber in the same condition as it exists in the living tree. The various means employed to arrest this destructive fermentation are either to wash out the sap by long soaking in water, aided by the action of the sun, to dry up the sap, either naturally by exposure to the sun and wind, or artifically by heated currents of air' Nearly all authorities agree that there is great advantage in having our woods properly seasoned in this climate. A firm of dealers in wooden ware, writing from Liverpool recently, commented most strongly upon the subject, and stated that *the advantage*

of having the woods seasoned in New Brunswick climate gives manufacturers an undoubted advantage.

With the foregoing facts before us, it cannot but be admitted that the consumers are much better served by having the woods cut up and seasoned in this country. They obtain better material unquestionably. The saving in raw material should insure lower prices for them, and the saving in freight is a considerable item.

At the conclusion of Professor Macoun's interesting and valuable address, which was received with great applause, a valuable discussion took place.

BALANCING PULLEYS.

IF a pulley is placed on a mandrel that is too loose for the bore, and one of the set screws tightened just to hold it in place, the wheel is not going to be brought to a perfect balance by placing the shaft on narrow edged bars and weighting the lightest side till the wheel will stand in any position. Neither will it do to wedge an arbor on all sides with shingle nails filed to a point with the object of bringing the mandrel in the centre for the purpose of balancing Leaving the wheel to stand loose on the shaft while the arbor is rolling on the bars will give a much better result, but to get a wheel anywhere near perfect in balance a nice true mandrel must be used that will let the wheel drive on to the centre, and made to rest between two narrow straight-edged bars that have been tested with a spirit level. This gives a revolving motion so delicate that it stands next to the knife edge in accuracy and requires but the slightest weight to throw the wheel out of balance. The pulley will have a tendency to roll back and forth when placed on the bars. and this is sometimes taken advantage of in finding the lightest side of the wheel, as it is as important to find the place where the balancing weight is to be added, as it is to determine the amount that is to be attached to the weight of the wheel. During the rocking motion of the wheel a mark is made on the rim at the same height from the supporting bars, as the wheel comes to rest on each forward and backward movement. The central position taken from these points locates the lightest side of the wheel in about the manner that the dead centre of an engine is found by blocking under the crosshead, and throwing over the fly-wheel till it is brought up by the same stop again, and dividing the movement in halves. The wheel is then rolled around till the lighted side stands level with the mandrel. This brings the centre of gravity the farthest to one side of the central line of the wheel, and assumes some of the good qualities of a balancing scale. A weight sufficient to hold the wheel in this position will be all that is needed to keep it equally poised in any part of the circle.—*Boston Journal of Commerce.*

TIMBER AND DEAL FREIGHTS.

(*To the Editor of the Journal of Commerce of 24th January.*)

SIR,—It is much to be regretted that notwithstanding the anticipations of an improvement in trade all round, the first charters which have been made from Quebec this season are at rates little, if anything, better than those of last year. There is no doubt that the ruinously low freights which have ruled at Quebec and the deal and pitch pine parts during recent times are and have been owing in the greater measure to the reckless competition of owners having vessels engaged in these trades, especially North of Europe ships which appear to accept anything merchants think fit to offer. Last year prospects looked fairly good shortly after the opening of the season at Quebec, but, as usual, the market was spoiled by owners and captains rushing in and accepting whatever rates suited shippers and merchants to offer. The shipbrokers at Quebec complained of the action of the shipowners and captains in frustrating their efforts to establish an advance in freights. Shipowners have been acting under a sense of unreasoning panic, each trying to outstrip his neighbor in the race to ruin —grasping at anything and everything for the sake of employment, and apparently losing sight of the hopelessly unremunerative nature of their operations. From all quarters come complaints of the loss and of shipowners being reduced to the brink of insolvency, yet they make no effort to save themselves. It is self-evident that it is impossible for this state of affairs to continue ; the end must be very near at hand with a great many owners now. If a combined effort is not made to put freights up a general bankruptcy of owners of wooden vessels must inevitably ensue. Combinations and trades unions are resorted to and adopted in other industries when those interested find things arrived at a point which does not afford a living, and there should be no insuperable difficulty of shipowners entering into a combination for mutual protection. It must come to this, or universal ruin for the present owners of the large amount of wooden tonnage afloat, amounting to several millions of tons register, and representing many millions of money. To all appearances, under existing circumstances, the ships must pass into other hands at mere nominal prices, and perhaps new owners may be deluded into the experiment of running them at rates of freight which do not pay expenses, but they must speedily awake to the fact that the game is not worth the candle. This experiment has already been tried, in a measure, by foreigners, who have been acquiring ships at ridiculously low prices, as compared to their cost and intrinsic values, but the majority have discovered by this time that even under these conditions the result is disastrous.

There is no good reason why freights from Quebec should be less than 25s per load for timber, and from the deal and pitch pine ports 60s and 100s per standard respec ively. These rates would be easily obtained if shipowners will resolve to accept no less and stick firmly to that resolution. The trade can well afford it, wood goods have been selling at absurdidly low prices for some years past, and no one interested appears to be any the better off for it, except, perhaps, the consumers of the goods, who have, probably, been lining their pockets at the expense of the producers and shipowners. The trade was in a much more healthy condition when p ices were considerably higher than they are now, and any movement in the direction of a return to better rates should be welcomed by the shippers, carriers and merchants. Anyhow, it is a quest on of life or death with the shipowners, and it rests with them whether they will make a stand for existence or quietly submit to extinction.

It may be said, in addition, that if owners abroad would give positive instructions to their agents in England not to fix their ships at such ridiculously low rates it would be some help towards getting freight up. British shipowners are anxious to hold off, but when they see foreigners rushing in and snapping at everything, they are obliged, in self defence, to accept what they can get,

It is utterly impossible for ships to pay expenses out of such a rate as 19s to 20s per load from Quebec, as instanced by the following particulars of a voyage made last summer by a ves-el of 950 tons register under favourable circumstances as to outward freight and all possible economy as to expenses, viz. :—

Disbursement at port of departure, including provisions and outfit		£302
Disbursement at Queb c		367
Insurance on hull and freight out and home		269
Disbursement at port of discharge, including captain's and crew's wages		392
Brokerage on timber charter		14
Sundry commissions		49
		£1,393
Freight out to Quebec	£ 200	
Net freight from Quebec to a port in U. K. at 19s 6d per load	1,084	—£1284
Loss on the voyage		£ 109

SHIPOWNER.

THE TREATMENT OF FOREST SEEDS.

WM SAUNDERS, F. R. S, C., Director of the Central Experimental Farm, Ottawa has issued the first Bulletin relating to the workings of that establishment Among many other things of interest we find the following remarks regarding the treatment of forest seeds.

The great importance of encouraging and stimulating tree planting among the farmers, especially in the Northwest Provinces, is beyond dispute. It is felt also that this can only be accomplished on the scale of magnitude required by the planting of suitable forest tree seeds, which can be gathered from the native trees growing in the Provinces or purchased at a small cost. This lea ls us to add a few words of advice on the general treatment of forest tree seeds.

Many of the tree seeds which mature early are better sown soon after they are gath red This applies especially to the several varieties of elm and to the soft maple. The hard maple, box elder and ash seeds keep well over winter, provided they are stored in a cool place and not allowed to get too dry. Acorns, nuts and stone fruits are most successfully planted in the autumn, but if kept over winter should be mixed with moist sand and exposed to frost and planted as early as possible in the spring, taking care that they are not at any time left in masses under conditions so as to heat. Many failures with seed arise from not sowing it in partial shade. If seeds are exposed alternately to hot sunshine and cold, while they are swelling, they will frequently rot before they appear above the surface. The requisite shade may be obtained by the use of brush wood, or a light layer of corn stalks or straw, removing this as soon as the seedlings are up and fairly established. Many nurserymen enclose their seedbeds with wooden frames, on which are laid light frames made of one-inch strips and covered with cotton or muslin. These are convenient and can be provided at small cost. Seedlings of evergreen trees grow slowly and require to be shaded and kept moist during hot weather all through the first year of their growth and sometimes longer. Seeds take some time to swell their coats after being placed in the ground, hence, if planted dry, they should be sown as soon as soil can be had to cover them. Germination may be hastened, especially with seeds of hard texture, by pouring hot water on them and allowing them to soak for twenty-four hours before sowing.

Seeds sometimes fail to grow from being planted too deep. The larger nuts and acorns should be covered with soil about as deep as the seed is thick ; other smaller seeds should not be covered with more than half an inch of mellow soil, pressed gently with the back of a spade so as to make the earth firm around them, and when the young seedlings appear they should be carefully weeded. Occassionally seeds will remain in the ground until the following season without germinating. Should any fail to grow by the time spring is over. and on examination the kernels are found sound, the seedbeds should be kept weeded and shaded until the next season.

Anyone desirous of securing a copy of the Bulletin referred to can do so by addressing the Experimental Farm, Ottawa.

British Trade With Canada.

The export and import trade between the United Kingdom and Canada in the month ended the 31st ult. shows a total export from the United Kingdom to the Dominion, of £505,769 contrasted with £435,467 in January of last year, an expansion of £70,302. equal to 16 per cent. Of horses £750, in value was shipped to Canada in excess of last year. Articles of food and drink show a falling off, and in raw materials, wool exhibits an increase of £2,200. The expansion in cotton piece goods is £20,975, being £137,038 last month against £116,029 for the corresponding period. Of linen piece goods there was £3,700 more shipped than in the first month of 1886, and of silk broadstuffs £2 600. Woollen fabrics show a falling off of £7,400, but in worsted fabrics there was an increase of £18,500, and in carpets of £6,000. Hardware and cutlery were shipped £300 in excess of January last year. The exports of iron show a marked increase, the total being £42,640, as compared with £17.111, an increase of £25,529, or 149 per cent. The increased value of the exports of machinery is £500 in steam engines, and £400 in other kinds. An increase of £12,400 is shown in haberdashery, £2,300 in earthen and china ware, and £5 800 in seed oil, but in apparel and slopes there was a decrease of £700 and in stationery of £900. As to the imports from Canada to the United Kingdom the total last month amounted in value to £50,373 against £35,150 in January, 1886, showing an increase of £16,223, equal to 47 per cent. Of wheat, £7,695 came to hand, none being imported in the corresponding month. Flour shows an increase of £7,400; butter, £3,400 ; and cheese, £2,300 ; but in cured and salted fish a decrease of £2,300 is exhibited. The imports of copper ore were $8 400 more in January last year, but the lumber trade shows a decided falling off, the quantity of hewn wood received being only £24 in value, or a decrease of £3.716, and of sawn wood £7 012, a reduction of £6,900.

The Duty on Sawn Lumber.

A well-known lumber merchant says the duty of $2 per thousand feet, which was imposed by the Government last session on all unsawn lumber exported from Canada to the States, has had the effect of stopping the taking of Canadian lumber by Americans. The few Americans who had the misfortune to have large limits on their hands at the time the tax was imposed have either disposed of them to Canadian firms or erected mills on the Canadian side, where they sawed up the lumber and then exported it free of duty to the other side. Since this duty was imposed Canadian lumbermen have had much brighter prospects, and he thought that ere long our lumbermen of the Lake Superior and Georgian Bay districts would be able to compete with their neighbors across the line.

Taper Pike Poles.

We direct the attention of our readers to the advertisement on page 15 of this issue, of W. Forsyth, Peterborough This gentleman has lately gone into the manufacture of Taper Pike poles, which is something entirely new to the Canadian trade. A large number of the leading lumbermen in Eastern Ontario are already using this article and consider it by far the best that has yet been introduced. When an article of merit is placed on the market and once tested, it generally finds a ready sale, as doubtless will be the case in this instance. Our readers would do well to send for a sample article.

No Voice For War.

In regard to the little hostile demonstration made by a few small politicians on account of the fishery troubles with Canada. no doubt the editor of the Orange, Texas, *Tribune* voices, in a rough way, the sentiments of every Confederate veteran in the following paragraph.

"Well, we say let 'em fight. We don't care, but we don't want any of it in our'n. We used to be quite ardent and patriotic, but that was when we were too young to know any better, but we have gotten gloriously over all that as we have come to the conclusion that we would rather go down the shady side of life with a whole hide than to have our name recorded on the sacred pages of history, if we have to cross over the flood loaded with lead to get it recorded."

To Prevent Dry Rot.

It has been ascertained that timber which has been floated in water for a considerable time is no longer liable to the attack of dry rot. The albumen and salts are slowly dissolved out, thus depriving the fungus of the nutriment needful for its development. A French experimenter has shown that fresh sawdust rots away in a few years in damp earth, whereas sawdust from which the soluble matters have been soaked by water remains unchanged under like circumstances.

CHIPS AND SAWDUST.

Mr. J. Warren, of Cobden, purposes erecting a large sash and door factory in that village.

Messrs. Rowe, Avery & Hare, of Hampton, Ont., intend running the saw mill at that place.

A. D. McNab and R. C. Campbell have opened a new lumber shanty near Golden Lake, Ont.

Mr. Wm. Robinson is said to have leased the sawmill at Furnace Falls from Parry & Mills.

The Rathbun Company will take out about sixty thousand railway ties around Calabogie this winter.

L. J. Hughson & Co., lumber, Sarnia, Ontario, are succeeded by the Muskoka Mill and Lumber Company.

The closing down of the box factory at Waubaushene has thrown quite a number of men and boys out of employment.

A gentleman from Perth is trying to get a site for a small mill which he intends erecting in the spring at Calabogie, Ont.

Messrs. Shurly & Dietrich, of Galt, have received a large order for their lance tooth cross-cut saws from the Western States.

It is reported that Mr. McRossie, lumberman, of Kingston, is about to build a large mill on the Madawaska river near Calabogie, Ont.

Chew Bros'. mill, at Midland, is running constantly cutting the oak recently purchased from Mr. S. Frazer. The timber is turning out well.

Boyd Caldwell's mill at Wilbur Station, Ont., started to cut shingles on Jan 1st., and will cut all winter. Donaldson's mill will also run all winter.

Ottawa lumbermen report sales to be slow, prices high and purchasers holding back and do not seem inclined to buy. Scarcity of box cars is a great hindrance to the shipment.

The Export Lumber Company of New York is credited with having recently purchased the entire cut of McLaughlin Bros., Ottawa, Ont. The purchase amounted to about $500,000.

The A. Mfg. Co's men and teams have been in the lumber woods west of the Albert Mines, N. B., about three months, and at the present time have more than 5,000 logs yarded.

Grant's shanties on the Bonnechere intend breaking up on account of the deep snow and thickness of the crust, as it is impossible for horses to work owing to their legs being badly cut.

The suit, involving 25,000,000 feet of lumber, between the liquidator of the Rainy Lake Lumber Co., Rat Portage, Ont., and the Union Bank of Toronto, was decided in favor of the bank.

The celebrated suit involving 2,500,000 feet of lumber between the liquidator of the Rainy Lake Lumber Co. and the Union Bank, has been decided in favor of the bank by the supreme court.

W. A. Quinton, M. P. P., has about 70 men lumbering in the vicinity of Loch Lomond and 25 men in the woods in Lancaster, N. B. Mr. Quinton will get out a large quantity of logs this winter.

The Chatham Manufacturing Company have secured a valuable tract of timber land in the vicinity of Newbury. There are walnut, chestnut, oak, white ash and other timbers of good quality on the limit.

In 1877, Montreal shipped to Great Britain 3,400 000 feet of lumber, and to South America 8,000,000 feet. In 1886 the shipments to Great Britain amounted to 98,000,000 and to South America 21,500,000 feet.

For the want of snow lumbering operations in New Brunswick have been somewhat curtailed. Patrick Long intends putting in about 1,000,000 feet on the Kennebecasis river this winter for Freeze Bros., of Penobsquis.

Rat Portage *Progress*:—We understand that Mr. Mather is sending a gang of men under the superintendence of Des'. Marris, up to Rainy River to build a boom to facilitate the transportation of his logs the coming spring.

The Glencoe sash and door factory is to be rebuilt by Messrs. Huston, Hopkins and Stevenson, who are about to purchase a couple of lots near the railway station from A. P. McDonald for the purpose. The new building will be of brick.

The lumbermen on the Gatineau report that there is more snow this year in the bush and on the open and rivers than has been seen for a number of years in that district, and they say that if the spring comes with a rush all the rivers will be swollen greatly.

Reports from Baltimore, N. B., state that times are dull there this winter. Very little lumber is being cut. William and Edward Stevens will get in about 20,000 feet at their mill for spring sawing. George Irwin will get in 10,000 feet or upwards at his mill.

Mr. T. P. Pierce gives notice in the *Canada Gazette* that he has purchased the property of the Cobourg, Peterborough and Marmora Railway and Mining Company, and will apply to Parliament for an Act authorizing him to build the road and operate the mines.

In some of the shanties up the Ottawa river log cutting for some time past has been curtailed for a want of means of getting the logs to the ice. Teams suitable for the work are in some cases getting $1 75 a day and the demand is brisk. Snow is reported to be deep in the woods at present.

Mr. Hooper, President of the British Carriage Manufacturers, after a tour throughout Ontario and Quebec, is writing a book upon our hard woods. He advocates the utilization of our immense and injurious waste of sawdust by mixing with pitch or something similar and pressing into bricks to be converted into charcoal, for which there is a great demand in England.

James Connelly, who has had charge of one of Mr. J. R. Booth's shanties on South River, returned home recently suffering acutely from injuries received while working in the woods. It appears that while loading a sleigh a log slipped from its position on the rollway and passed over his body, breaking several of his ribs and otherwise severely injuring him. It is thought he will speedily recover.

It is stated that the largest tree in California is to be found in Tulare Co. It is four hundred and thirty-eight feet in circumference. To comprehend the size of this tree, one has only to reflect that a building forty-five feet square could be set on the butt for a foundation, if the tree were cut down, and not project over the sides. "The Father of the Forest" seems to be a fitting name for such a monster.

Fine specimens of French walnut have come as high as $2 a pound. Ebony is as costly as French walnut. It often brings as much as $300 a ton, providing the wood is of the finest quality. Five dollars a pound is often asked and received for exceptionally fine pieces. Rosewood and mahogany are popular woods and are always in demand. The best mahogany comes from San Domingo. Rosewood is worth from three to six cents a pound.

Below we give a statement of the quantity of logs and timber that will go down the French River in the spring:—Ontario Lumber Co., 20,000,000 feet of logs, and 50,000 cubic board pine. Georgian Bay Lumber Co., 200,000 board pine. McLean & Co., 6 000,000 feet of logs. Sluch & Co., 6 000,000 feet of logs. Whiting & Co., 4,000,000 feet of logs. L. & H. McLean, 5,000,000 feet of logs. Power & Co., 7,000,000 feet of logs. Oscoda Salt and Lumber Co., 8,000,000 feet of Tonawanda timber. Emery Lumber Co., 18,000,000 feet of logs.

A Winnipeg lumber dealer states that at the present reckoning, the number of feet of lumber in Winnipeg and points between that city and Port Arthur, including the latter place, is estimated to be between twenty and twenty-five millions. It is claimed that at this season last year there were about forty-five million feet, and present prices are pretty stiff in consequence of the limited stocks held by dealers. They report no heavy transfers, but are perfectly satisfied with the outlook, as considerable activity is expected in the province and the west when the building season opens.

A correspondent writing from Winnipeg to the *Mechanical and Milling News* has the following regarding the lumber trade:—A number of lumbering companies have their headquarters at Winnipeg, but there is now only one mill which saws in the city. The logs for this mill are procured from tributaries of the Red River which flow into the river from the east side. Supplies of timber from this source are pretty well exhausted. The companies represented here have their mills at Keewatin and Rat Portage, on the Lake of the Woods, and some on Lake Winnipeg. There are also supplies of timber on Lake Manitoba and Winnipegoosis, and on the streams and tributaries of the head waters of the Assiniboine, in the northern portion of the Province, but these have only been available for local purposes. The great central portion of the Northwest is devoid of timber to a great extent, though the Wood mountains and Cypress Hills supply some timber districts. In the Cypress Hills there is a saw mill which does a considerable trade in supplying the stations along the C. P. R., in the central parts of the territories with lumber. The lumber is hauled to Maple Creek, on the C. P. R., 600 miles west of Winnipeg, from which the mill is about thirty miles distant. Calgary promises to be a centre of the lumber industry of considerable importance, and will likely be the chief supply depot for the far-western country. Already several companies have their headquarters there, and a large mill is in course of erection. There is plenty of timber tributary to the Bow river west of Calgary, whilst the mountains furnish almost an unlimited supply. The lumber trade has been demoralized here ever since the boom days of 1882, and is only now being placed on a firm footing. At that time anything in the shape of lumber was bought up immediately on arrival at exorbitant prices, and the mills were unable to keep up with the demand. In the following year, however, the business was greatly overdone. Stocks became excessive, and prices were demoralized by a course of cutting which was vigorously indulged in by all the firms. Surplus stocks have now been reduced and during the present year there is every indication that the trade will be a satisfactory one. The log crop in the district tributary to Winnipeg will be somewhat larger than last year, but will not be excessive, and dealers expect to do a paying business for 1887.

GENERAL INFORMATION.

A curious application has recently been made of electricity to condense dusts and fumes. If air filled with smoke is charged with electricity the smoke at once flies to the sides of the containing vessel in a way that appears almost magical. In the same way, electricity will cause fine dusts which are in suspension, and which are often very difficult to remove from the air, to condense, or coagulate so as to be easily removable.

Take care (says *Power and Transmission*) how you let any machine oil or lubricator come into contact with a cut or scratch on your hand or arm, as serious blood-poisoning may result. In the manufacture of some of these machine oils fat from diseased and decomposed animals is used. All physicians know how poisonous such matter is. The only safe-guard is not to let any spot where the skin is broken be touched by any machine oil or lubricator.

A sash, door and blind maker says there is more waste of lumber in the business than is always taken into account. Says he: "A man figures that his lumber costs him so much, his labor so much and his interest, taxes, insurance and what not so much more, and that there ought to be so much left for profit; but when he comes to figure up at the end of the year, he has to inventory his plant at all it cost him to make his books balance." This will apply to others besides the sash, door and blind makers.

On the 27th ult., the annual meeting of the Canadian Rubber Company was held in Montreal. Directors were chosen as under:—President, Andrew Allan; vice-president, James Benning; Directors—William Withal, H. M. Allan, Hugh McLennan, Arthur Prevost, H. A. Allan, Francis Scholes and J. B. Larmonth. Some days ago, this old and successful company gave a festival to their employes, numbering nearly 1,000, the occasion being the opening of a new wing which has just been added to the already extensive premises.

An important enterprise nearing completion on the Pacific coast is the postal telegraph in course of construction between Westminster and San Francisco. From the latter point to the British Columbia boundary is about 1,100 miles, and from thence connection is made with the Canadian Pacific telegraph system. All parts from Victoria and other points on Vancouver Island, thence eastward to Winnipeg are brought into direct communication with the Atlantic seaboard and European cable. Altogether there are included about 60,000 miles of wire.

Canadian shipping has considerably diminished during the past year, the statistics of all the Maritime Provinces showing a decline. There were struck off the list of registered tonnage in Nova Scotia, New Brunswick and Prince Edward Island, in 1886, 290 vessels, aggregating 72,346 tons, while the newly registered for the year numbered 215 and 34 643 tons showing a net falling off of 76 vessels of 37,703 tons. While at five ports of registration in Nova Scotia there was an increase in tonnage; such did not occur at all in either New Brunswick or Prince Edward Island.

Shoe pegs require 100,000 cords of timber annually in their manufacture; matches, 300,000; lasts and boot trees, 500,000. All this is of the most superior quality, straight grained and clear of knots and gnarls. To raise the telegraph poles of the country required 800 000 trees, and 300,000 more are required for annual repair. The railway ties of the country annually consume 75,000 acres of timber at least thirty years old, and the fencing of railways represents $45,000,000 and the annual repair $15,000,000. These are but a moiety of what is required of the United States forest supply. The burning of brick alone requires 2,000 000 cords of wood annually.

The improved French method of preserving wood by the application of lime is found to work well. The plan is to pile the planks in a tank, and to put over all a layer of quicklime, which is gradually slaked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less time according to its thickness. The material acquires remarkable consistence and hardness it is stated, on being subjected to this simple process, and the assertion is made that it will never rot. Beachwood prepared in this way for hammers and other tools for iron work is found to acquire the hardness of oak, without parting with any of its well known elasticity and toughness, and it also lasts longer.

An English Journal enumerates the following as among the inventions which are specially needed at the present time:—Macaroni machinery, good red lead pencils, type writers that will work on account books and record books indelible stamp cancelling ink, a practical car starter, a good railway car ventilator, better horse shoes, locomotive headlights, an instrument for measuring the velocity of wind currents, apparatus for measuring the depth of the sea without sounding by line, piano-lid hinge which shall be flush on the outside, good fluid India ink for draughtsmen, a good metallic railway tie, an effective cut off for locomotives, a method of alloying copper and iron, and a molding material for iron and brass casting, capable of giving a mold that can be used over and over again.

THE CANADA LUMBERMAN

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. MORTIMER, PETERBOROUGH, ONT.

Terms of Subscription:

One copy, one year, in advance $1 00
One copy, six months, in advance 0 50

Advertising rates furnished on application.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER, Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

Our Readers who write to Advertisers in this Journal, will oblige both the advertiser and Publisher by mentioning the "Canada Lumberman."

PETERBOROUGH, ONT., MARCH, 1887.

IT is authoritively stated that the Export Lumber Company, of New York, has contracted for 41,000,000 feet of timber in Canada, involving a consideration of nearly $700,000.

MR. ALEXANDER MCEWEN, timber merchant, Caithness Steam Saw mills, Wick, N. B., has taken into partnership his son, John McEwen and his son Alexander James McEwen, both of them having been for many years associated with him in the business, and henceforth the style of the firm will be Alexander McEwen & Sons, timber merchants, Wick, N. B.

THE Lieutenant-Governor of Ontario, in his speech from the Throne, on the occasion of the opening of the Ontario Legislature, February 10th, said that the question of the right to the timber and minerals in the territory awarded to Ontario by the Privy Council, has been carried to the Supreme Court where it stands for judgment. Will the people ever hear the last of this question?

THE heavy tax imposed by the Province of New Brunswick on all wood cut from Provincial or Crown Lands, seems to have had a bad effect on the trade. Every influence has been brought to bear on the representatives of the Local Legislature to make a reduction on this tax, but so far nothing has been done in the matter, It is to be hoped that something satisfactory to the lumbermen will be done in this matter at the next session of the Provincial Parliament.

THE *Journal of Commerce*, Montreal, lately presented figures showing the decline of Quebec's lumber and timber shipping interests, and a corresponding increase at Montreal. The decline at Quebec is seen in this, that in 1877, vessels to the number of 796 cleared from that port, loaded with an aggregate of 670,627 tons of lumber and timber, while in 1886 the number of vessels was only 325, with cargoes aggregating 250,635 tons. In 1877 only 10 vessels cleared from Montreal, with 3,400,000 feet of lumber and timber; but in 1886 the amount of superficial feet of lumber and timber shipments amounted to 98,277,000 feet.

"BOOK-KEEPING for Country Storekeepers" is the suggestive title of an article published in the February issue of *The Offi* from the pen of Mr. E. R. C. Clarkson, of Toronto, Ont. Mr. Clarkson's effort is to show how country store keepers may keep their accounts so as to know how they stand at all times, and steer clear of the shoals of insolvency. His paper is accompanied by some illustrations of journal forms differing in some of their features from the conventional book-keeping of the schools, but the use of which would facilitate the commendable results that he has in view. *The Office* is published at 205 Broadway, New York, and every issue is replete with articles of interest and importance to accountants and business men.

THE projected bridge across the St. Lawrence river, at Quebec, has been the cause of much discussion among the members of the city council of the ancient capital, but from latest accounts it seems that the resolutions on the subject have now received the sanction of that body. It is estimated that to erect a bridge of a character desired, that three millions of dollars will have to be raised. The harbor commissioner of Quebec proposes to submit the trade of the port to a tax sufficent to pay the interest on this sum of money, but it is not likely that his idea will be carried out, for the reason that it is not entirely a local work.

OUR American contemporaries are discussing the merits and demerits of a new company which has lately been organized by some of the Pacific coast lumbermen, to test the efficacy of a plan of controlling the market for their output—that of actually marketing the entire mill product through a special corporation. The new company will purchase the lumber from the mills, and distribute it wherever a market may be found, either local or export. It is expected that by this method competition will be avoided, expenses lightened, and profits increased. The prospects are that the new idea will prove a success, so long as the business retains manageable proportions, but no longer.

ON pages 4 and 5 of this issue of the LUMBERMAN we publish an almost complete report of the lecture delivered by Prof. John Macoun, F. L. S., F. R. S C., before the Carriage Makers Institute, in London, Eng. It is so full of interest and vital importance to Canadian lumbermen, that we have no doubt but that all our readers will give it a careful reading. We are pretty safe in asserting that no other man in Canada is better posted in "lumber lore" than Mr. Macoun, and it is a pleasure to note that he is bringing his knowledge into practical use. It is a satisfaction to be able to inform our readers that this gentleman will hereafter be a regular contributor to the LUMBERMAN.

AMONG the many attractions at the late ice carnival in Montreal was the Lumbermen's Camp, which was appropriately placed under large trees on Phillips Square. Within the camp the scene was a typical one, true to life in every particular. In the centre blazed a large fire of logs, while over this was suspended the *chandleres*, in which are concocked the *soupe aux pois* and other such delicacies. At one end are arranged the sleeping bunks, providing room for ten men. In the rear extension is the cook's shanty, and the dining table. Here a regular bill-of-fare was provided at a nominal figure, and from all accounts a large number of people availed themselves of the novelty provided. Mr. W. Parker acted as *chef de cuisine*.

So far as can be learned from different sources throughout the Dominion, the lumber trade has had no reason to complain of the amount of business done, and the probabilities are that trade will continue to increase. During January there was an advance of 50 per cent. over the business of the corresponding year. Prices rule about the same, with a prospect of an advance in certain quarters. In the Ottawa district it is said that lumbermen are indifferent about having more logs cut this season until a better opportunity offers to have them taken out. In all probability the cut will be large during the coming season, and with the already perceptible improvement in the English market, it can fairly be conceded that the export will far exceed that of last year.

IT is expected that the Provincial Governments of Ontario and Quebec will withdraw from the existing arrangement for the collection of the timber dues in the Ottawa district. At present the Dominion slide dues, and Ontario and Quebec timber duties are collected by the Ottawa Crown timber office, the expense of maintaining the same being borne jointly by the Dominion Government and the Governments of the two Provinces, the appointment of the officials resting with the Dominion authorities. The Provincial Governments seem to think that a more economical arrangement might be made, by which the Crown timber revenues of the two Provinces may be collected jointly without reference to the Federal Government.

AN English exchange in reviewing the lumber trade of that country during the year 1886, points out that a deficiency existed of 803,787 loads of timber, compared with the year previous. London, as the leviathan of the trade, fell short by 170,000 loads; Liverpool, which is unrivalled for second place, 87,000; Barrow gave way 22,000 loads; Bristol, 36,000; Cardiff, only 15,000; Gloucester 37,000; Grimsby, 66,000; Hartlepool, 48,000; and Hull, the capital of the east coast, only 19,000; Lynn, 13,000; Newcastle, 20,000; Newport (Mon.), 59,000 (a very fluctuating market); Plymouth, 8,000; Shields (N. & S.), 22,000; Sunderland, 29,000; Swansea, 14,000; Wisbech, 16,000. Then Scottish ports: Aberdeen, 41,000; Alloa, 10,000; Dundee, 7,000; Grangemouth, 56,000; Granton, 19,000; and Greenock, 17,000 loads. Then in Ireland: Belfast is 12,000; Dublin, 19,000; Waterford, 3,000 loads short of their supply in 1885.

A HALF century's incessant onslaught by saw mills and tanneries on the once dense forests of pine and hemlock in the counties of Northwestern Pennsylvania and the adjoining counties of New York State, has at last virtually exhausted them. Out of 150 immense tanneries in operation fifteen years ago, it is said that there is not enough bark left to keep more than half a dozen in operation to-day, and not more than one of these can be run over three years longer. The same state of affairs exists in Wayne County, which, ten years ago, sent annually to market 125,000,000 feet of hemlock lumber. To-day not more than one-quarter of that amount is cut In Canada we find ourselves in a similar position, and the fact is be regretted for the reason that it is only of late that the true value of hemlock has been recognized by cabinet makers and others engaged in the utilization of wood.

ADVICES from Miramichi ports indicate that although the export from the principal spruce ports has been curtailed, that from Nova Scotia, as well as from the smaller ports in New Brunswick—places not having the heavy stumpage tax to contend with—the export has been increased. This has brought the total export for 1886 nearly up to that of 1885. Notwithstanding this, and also the fact that freights ruled lower than in any previous season, the business has been unprofitable, the consumer and not the producer receiving the benefit. The shipments from this port during 1886 were less than half what that they were in 1877, 1880 or 1883, but it is not expected that any further decrease will take place, in view of the fact that the sawing power has lately been doubled, and only part of this was utilized during the past season. The stocks of both manufactured and unmanufactured woods on hand are estimated at twenty-five millions superficial feet.

AN investigation was lately undertaken in the Michigan legislature looking to the abolishment of those dens of iniquity called "stockades," which abound in the lumber and mining regions of the northern peninsula of that state An exchange in commenting on this subject uses the following strong but expressive language: "Ordinary debauchery, when under the eye of municipal police, is shocking enough, but when the lowest order of brutes, in the semblance of men, seek the seclusion of the almost illimitable forest, and there establish houses of prostitution, into which they entice the dissolute of both sexes, and where horrors and cruelties too deep for conception can be perpetrated without scrutiny of law, it becomes a damnable disgrace to any class of men who wink at it, and a double-dyed stain on the state that permits it. And when ignorant or unsuspecting girls, whether wholly innocent or not, are inveigled from their city homes, and spirited away to become slaves in such dens, as has in several instances been proved, the outrage becomes so intense and stupendous that words are impotent to adequately characterize it."

WITH the object of more thoroughly introducing the CANADA LUMBERMAN to the trade of Canada, the United States and England, we have undertaken the work of issuing, on Friday 1st April, next, a special edition of six thousand copies. Every effort is being made to make this edition, both in size and nature of contents, in advance of anything yet introduced by the trade press of Canada. Some of the best authorities on the lumber trade, in every Province of the Dominion, will contribute to make this special effort a success, and one worthy of the great industry whose interests it is intended to represent. By reference to the prospectus to be found on page 18 of this issue, full particulars regarding advertising space, etc., are make known. At no other season of the year will an investment in advertising pay so well as at present, and it is to be hoped that wholesale lumber merchants, manufacturers and others, will make free use of the pages of THE LUMBERMAN next issue. It is intended that every man engaged in the lumbering and wood-working branches of trade in Canada, will receive a copy of this issue. The wants of anyone making application by letter will be promptly attended to.

THE month that has intervened since the last issue of THE LUMBERMAN, is one which will long be remembered by Canadians as a period of political turmoil second to none in the annals of this country. For three weeks previous to election day business was practically at a standstill, and men were left to indulge to their heart's content in the discussion of the vital issues before the country. Fortunately, the elections in this country are hurried through in a few weeks, instead of piecemeal and periodical elections months ahead of the time when officials and legislators enter on their duties, as is the case in the United States. The one great issue of the late campaign was that of the National Policy, and notwithstanding Mr. Blake's expressions of friendship towards a protective tariff, the issue became none the less interesting and on this the electors cast their votes. The question of secession in Nova Scotia came in for a considerable amount of discussion from both sides, and it is pleasing to note that a large majority of the people of that Province are still loyal to confederation. The Nova Scotian difficulty will doubtless be settled by concession and possibly a re-arrangement of the tariff. This province has as much Home Rule as Ireland would gladly

accept, and more freedom to talk secession than would be allowed her as one of the United States. From among the successful candidates we find more than one prominent lumberman, while there are also to be found others who fought the fight, but came out less victorious. After the election of representatives to the Ontario Legislature THE LUMBERMAN had the pleasure of congratulating Mr Brouson, of Ottawa, on his success. It is now an equal pleasure to extend to Mr. Perley, the Conservative candidate, our congratulations also, with the hope that both he and the other members of the fraternity he represents, may successfully watch the interests of the lumber trade whenever any measure effecting the same may arise in the House.

IN a letter to the *Saw Mill Gazette*, on the cause of fires in wood-working establishments, Mr. A. Christofel, of Brooklyn, N.Y., calls particular attention to what he calls "draft-back," which, he says, "is nothing more nor less than a gas explosion. This has caused the destruction by fire of a great many mills, and is the result of improper stocking. Shavings have to burn from the top and never from the bottom, as a smouldering fire only makes smoke with very little heat. Wood or shavings contain many insidious vapors which, combining with the carbon of the charred shavings and the oxygen of the air, are likely to produce a violent explosion at any time. Whenever the fire is allowed to become too low and a large lot of shavings have been thrown into the furnace, do not leave the boiler before the flames and draft are fully established, and remove all lihgt combustible materials to a safe distance, and then there will be no danger."

NEWS.

Logs are coming over the Bay of Quinte Railway in large quantities.

Saginaw's rail shipments amounted to $132,000,000 in round figures last year.

The book-keeper in McMillan's mill at Winnipeg, was murdered a fortnight ago.

The cedar mill at Deseronto, is again running. About 100 men and boys are employed.

The Georgian Bay Lumber Company are taking out a quantity of square timber on Black River this season.

The Minneapolis and Ontario Lumber Co. has purchased fifteen hundred million feet of timber in British Columbia.

Operations in the woods around Quebec are going on briskly and a large output of logs will be the result when spring opens.

The season's cut of logs and lumber that will come down French River in the spring is 74,000,000 feet of the former and 250,000 feet of the latter.

Quarter-sawed lumber has become so popular with customers throughout the country, that a great many mills are devoting considerable attention to that class of work.

The well known firm of Messrs. Hall Bros. & Co., of Quebec, has been dissolved, Mr. Lewis F. Peters going out. The business is continued by the remaining partners.

A. Hirtle, the proprietor of a planing mill in Berlin has effected a compromise at 50 per cent. secured on liabilities of $3,000. His assets were covered by a chattel mortgage.

In bridging the Echo river for the Sault Ste. Marie branch of the Canadian Pacific railway, in the Algoma district, 9 000 piles will be required, instead of 2,000 that were first contracted for

Mr. Grier's new saw mill at the Chaudiere is assuming goodly proportions. The frame work is erected, and the roof which is of an oval shape is placed. The structure is a large one and of a very substantial nature.

The number of new buildings erected in Montreal last year was 699, with a value of $2,131 834 against 429 for previous year with a value of $1,728,945, the increase being 270 buildings and valuation of $402,889.

The recent wood dust explosions seem to have awakened a general interest in the matter. We trust wood dust explosions will not come to be of such common, every-day occurrence as saw mill boiler explosions.

The mill-owners at the Chaudiere have gangs of men employed in making all necessary repairs and getting the mills in perfect running order. It is reported that the cut at the mills this year will be larger than last.

Peter Watt, of Ompah, Ont., while working in one of McLaren's shanties was struck by a falling tree. He met with severe injuries, the bones of his shoulder being crushed and his hand pierced through with a knot.

It is stated in a Kingston exchange that the swamps and lumber district out on the Kingston and Pembroke Railway are covered with water; also that the country is in a bad state, and that the lumber trade is materially affected.

The Upper Ottawa Improvement Company have nearly completed the annual repairs on their booms and other works up the Ottawa. They are in readiness to stand the high floods which are expected this season owing to the great quantity of snow.

Sawdust thrown on a circular-saw table will render the hauling of heavy planks quite easy. The grains act as small rollers and reduce friction.

The last season's cut of lumber in the White Lake district is being shipped now Twenty eight teams are engaged in drawing it to Pakenham, eight of which are drawing for J. R & J. Gillies. About 2,000 feet constitutes a load, and one trip a day is made.

Mr. J. R. Booth, has a gang of men employed in making repairs and improvements in his large saw mill at the Chaudiere. A busy season is expected by the lumbermen as there will be no delay for logs, as large reserves have been left over from last season.

A large number of lumber shipments were unable to be made lately owing to the scarcity of cars. Prices are not quite so firm as they were a month ago and buyers are not investing so freely as last year. At this date last year the quantity of lumber sold far exceeded this year.

Mr. David Edgar, a well-known resident of Hamilton, passed away during the month. Deceased was for many years a builder, but for the last ten years or more gave his attention to his lumbering business at Mitchell. Mr. Edgar was highly esteemed and respected by all who knew him.

Reports from the Dumoine and Kippawa lumber shanties state that the cut this year has been much interfered with by the immense amount of snow in the bush which has rendered the drawing of lumber to the ice very difficult and tedious, as it is almost impossible to keep the roads open.

It is understood that Messrs. Dobell, Beckett & Co., of Quebec, have purchased Mr. Little's Three Rivers deals, 4th quality, being the balance of his 1886 cut. The price paid was $27 and all charges. Messrs McArthur Bros. & Co., of the same place are reported to have purchased H. E. Hall's 1886 spruce. Some 65,000 q.s.s. at $41 $24.50, $22, and all charges.

Mr. J. Bell, formerly of Cavan, has located in the township of Cartwright, Ont., and has put up a saw mill, which works well. He intends building a bank barn, 70 x 40, and a house 24 x 34, during the coming summer. He will also have a boat in which to give his friends, who may wander that way, a treat.

The Rathbun Company have at present 475 employes at their works in Deseronto alone, a larger number than were ever engaged at this time of year. All told, in their different agencies, lumbering operations, &c., they have at present over 2,000 men in their employment. This vast army gives some idea of the magnitude of the Company's operations.

There will soon be an end to the far-famed redwood forest of California. There are no fewer than nineteen lumber companies now engaged in cutting down the "big trees," and all the mills are in constant work, as the demand for the wood is practically unlimited. The country will, therefore, be cleared in a very few years, for nobody makes even an attempt at replanting.

There is considerable work under way in the shipyard department at Deseronto this winter The yacht Norah is being completely rebuilt The engine and boilers have been removed from the steamer Puritan and she has been otherwise dismantled with a view of converting her into a lumber and wood barge. The Rescue will be fitted out with a new engine, so as to enable Capt. Murray to beat, if possible, his record of last year. The Quinte is also receiving a new boiler and other craft are receiving a complete overhauling.

A White Lake correspondent says:—The lumber that was sawed here last summer in the two mills owned by Gillies and Paris respectively, is being drawn to Pakenham, preparatory to its being shipped on the train. Gillies employs eight teams, while six are drawing from Paris' lumber yard for Marshall & Co., of Brockville. There are also fourteen teams drawing from Stewart's mill at Waba Brook to Pakenham. The average loads are over two thousand feet some being over three thousand. These are not bad loads considering the state of the roads lately.

The total number of miles of timber licenses issued at the New Brunswick Crown Land Office during 1886 was 4,116½, consisting of 1,068 applications, as against 1,625 of the year previous. In nearly every case applications for renewal were made, while about 475 miles of new berths were taken, making the total number of miles of timber licenses renewed 3,641, and the number of miles of new timber applications sold 375. The total average of licenses issued during the year is considerably in advance of previous years. Of this extent of timber lands under licenses J. B. Snowball has 406 square miles; John McLaggan, 309½; Kennedy Burns, 265; Geo. McLeod, 218; Allan Ritchie, 213½; John Stewart, 145½; Wm. Richards, 140; G. C. King, 110; Hugh McLean, 109.

The following clipped from the East Saginaw *Courier*, refers to Wm. Merrill, of Norwich, Ont. The *Courier* several weeks ago gave a history of the case of Wm. Merrill against Joseph Wilson *et al.* It has been decided by Hon. J. H. Steere, Circuit Judge of Alger County. The Judge decides that the complainant is entitled to the relief prayed for in his bill. This gives Mr. Merrill title to 320 acres of pine land in Alger County under a deed given by him October 3, 1885. As previously stated, Mr. Merrill had placed in the hands of his agent 1000 acres of pine land in Alger County for sale, and as he claims, the 320 acres of land were held by Wilson and others through fraud, and filed his bill to set aside the pretended title held by them. The case will be carried to the Supreme Court.

J. S. H. Clark, of J. S. H. Clark & Co., wholesale and retail lumber dealers, Newark, N. J., has been in the valley. This firm handles about 15 000,000 feet of lumber from the Saginaw valley annually, shipping largely by rail. Asked his opinion as to the probable effect of the Inter State Commerce law, he said it was an unknown quantity, but he did not believe that it would seriously effect the lumber traffic. He has recently returned from a visit to British Columbia, having been interested with an English syndicate in a vast tract of pine timber on the Shuswap Lake, about 300 miles east of Port Moody, near the Canadian Pacific railroad. Mr. Clark disposed of his interest in the timber, regarding it as too much of a future. In other works there was too little market and too much competition for the cheaper grades of white pine.

A correspondent writing from Duluth furnishes some interesting figures in regard to the lumber business in the Zenith city. He says: A short time ago, a local paper of this city, the *News*, gave a very general report on the lumber industry of the city, and among the interesting matters mentioned was the fact that the cut of the Duluth district, including the mills of the St. Louis river and Tower has been 161,000,000 feet in the past year, besides 43,000,000 shingles and 22,000,000. Of this total, a very small amount, probably not more than 50,000,000 feet, is now in yards, and of this only 20,000,000 feet is in this city itself. The cut of the coming summer promises to be slightly larger, as 165,000,000 feet is being cut in the woods, and 10,000,000 more will be driven down in the spring. The depression in the Duluth lumber trade seems to be over, and the lumbermen of this district are looking for a good business during 1887.

The *National Builder* gives the following items for the use of nails:—For 1,000 shingles allow 3½ to 5 pounds fourpenny nails; or 3 to 3½ pounds threepenny nails. For 1,000 laths allow about 6 pounds threepenny fine nails. For 1,000 feet clapboards about 18 pounds sixpenny box. For 1,000 feet boarding boards, 20 pounds of eightpenny common. For 1,000 feet boarding boards, 25 pounds tenpenny common. For 1,000 feet top floors, square edge, 38 pounds tenpenny floor. For 1,000 feet top floors, square edge, 41 twelvepenny floor. For 1,000 feet top floors, matched, blind nailed, 35 pounds tenpenny floor. For 1,000 feet top floors, matched, blind nailed, 42 pounds twelvepenny floor. For 1,000 feet furring, 1x3, 45 pounds tenpenny common. For 1,000 feet furring, 1x2, 65 pounds tenpenny common. For 1,000 feet pine finished, about 30 pounds eightpenny finish.

The New Brunswick Trading Company are well to the front for the new year's business, and although little over a year in existence, have, during the past season, done a very large business. Our readers will recollect that this company recently paid to their shareholders a dividend of 8 per cent., which we consider very good as times go. Though chiefly representing the spruce interest, the New Brunswick Trading Company are also largely engaged in the pitch-pine trade. The shipments of New Brunswick spruce during the past season have shown a marked falling off. From St. John, the shipments in 1884 amounted to 165,000,000 ft., but in 1885 they dropped to 152,000,000, and last year they only amounted to 136,000 000. From Miramichi, the decrease as shown in Mr. Snowball's circular has been even greater; for while in 1883 the total shipments amounted to 149,000.000 ft., in 1886 they were only 72,000.000 ft., less than one half. This shows that the recent advance of spruce prices on the west coast was not without justification. Were the North of Europe whitewood does not enter into prejudicial competition with spruce, as in London, Hull, Leith, &c., the advance recently established is likely to be maintained.—*English Ex.*

Mr. Hiram Robinson, general manager for Messrs. Hamilton Bros., lumber merchants, has just returned from an extensive visit to the Gatineau district where he was looking after the working of the shanties of the firm, Mr. Robinson said that the output of lumber this season on the Gatineau, was not as large as it would have been had there been good weather. The fore part of the season was splendid weather for lumbering and consequently a great many logs were made before the heavy snow storms set in. These storms rendered the roads in every direction almost impassible as there was a depth of five or six feet of snow, and in many places the roads were drifted to a much greater depth. Later on, consequent upon a heavy rain storm, a thick crust was formed which was another impediment, as it was very hard for horses to work in this crust while hauling logs and timber. None of the shanties of any of the lumber firms had to shut up, but many of the small jobbers were unable to continue their work, and consequently had to send their men down the river. "What is the quality and size of the lumber being turned out this season?" "Well, the quality is fair, and the size large. I think that on the whole, the quality is nearly as good as last year's cut."—*Journal.*

BRITISH COLUMBIA IN 1886.

IN the New Year's issue of the Victoria *Daily Times*, which consists of ten pages, we find a voluminous account of the progress and position of British Columbia and its principal towns. Never before in the history of British Columbia, says that journal, were the prospects so favorable for the development of the quartz mines; the coal trade is improving and the umber export finding new markets. The Esquimalt and Nanaimo railway was finished and begun to be operated and the dry dock was practically completed.

The estimate of revenues and expenditures of that province for the current financial year of 1886-7, puts the revenue at $576,161 05, and the proposed expenditure at $710,524 50. Of the receipts, the Dominion pays $100,000 for lands conveyed in trust; $48,000 in a *per capita* grant; $35,000 by way of subsidy and $29,000 as annual interest at 5 per cent. The provincial land sales are estimated at $100,000; free miners' certificates $24,000; licenses $30,000; provincial revenue tax $75,000; real property $24,000, and personal property tax $20,000. Among the proposed expenditures of the province we find $225,000 in public works; $94,000 for education; $50,000 for administration of justice (salaries, $75,000, not included); civil government $62,000; hospitals and charities $21,000; legislation $19 800.

The exports of British Columbia form an interesting list. From twenty to thirty million feet of lumber in various shapes were dispatched to foreign shores last year. From Victoria, the declared exports for 1886 to the United States amounted in value to two and a quarter millions, an increase of 11 per cent on the average of three preceding years, and consisted mainly of coal, coin, furs, skins, salmon, fish oil. The list is as under:

Coal	$ 896,312 84
Treasure	693,815 36
Furs, hides and skins	299 721 95
Seal skins (undressed)	218,452 61
Canned salmon and fish oil	53,676 60
Tobacco and liquors	21,055 01
Opium, rice and Chinese goods	18,973 03
Miscellaneous	46,934 14
Total	$2,248,941 54

The fiscal year 1883 showed the largest export trade from all ports of the last fifteen; it amounted to $3,345,000, and of this total $1,333,000 was from the fisheries. For the year ending June, 1886, the exports were:

The Mine	$1,720,336
" Fisheries	633,110
" Forest	200,178
" Field	1,917
Animals	329,248
Manufactures	1,035
Total	$2,885,824

The salmon pack for 1886 of the 17 canneries in the province amounted to 163,004 cases. The prices realized were regarded as satisfactory. The English market was reduced in the supply on hand carried over from previous seasons, thereby enabling shippers to place their pack of the coast to advantage. "The run in this province," says the *Times*, especially on the Frazer River, was slight, disappointing in fact. Nevertheless the prices realized will in a measure make up for the shortness in quantity. Many of the canneries are carrying over supplies for another season, when it is expected they will recoup themselves by an increase in the pack. Of the quantity mentioned above, there were sent: to the United Kingdom, 102,091 cases; Eastern Canada, 47,223 cases; Australia, 12,700; local dealers, 900 cases; total 163,004 cases. These were caught principally (103 000 cases) in Fraser River, the remainder in rivers Inlet, the Skeena, the Duncan and the Alert.

The city of Victoria is growing rapidly. In the year 1884, some $750,000 was expended in new buildings, in 1885 about $500,000, and last year a hundred and fifty structures were erected at a cost of $550,000. A list of something over a hundred of the largest tax payers shows their assessment to reach $2,892,000. The revenue of the city, which in 1876 was but $57,000 was in 1886 $134,000, a sum of $14,000 in excess of the previous year's revenue.

From the port of Nanaimo in the fiscal year ending June 1886 there was exported $975,000 worth of coal, iron ore, lumber and dogfish oil to the United States, Sandwich Islands, Mexico and Asiatic Russia. The imports of the same period amounted to $300,000.

Some figures relating to the city of Vancouver will prove of interest. This city, situated on a peninsula formed by the waters of Burrard Inlet and False Creek, possesses great advantages in extensive water frontage. Coal Harbor extends along its northern front three miles, and the noble roadstead of English Bay is beyond. The city limits embrace an area of six miles in length by two and a half in breadth. Since the disastrous fire of June last, buildings valued at $521,000 have been erected, which added to the assessment of the real estate, makes a total value of over $3 000,000. The city has put down fire protection pipes at a cost of $12,000. There are three saw-mills in the city having an annual capacity of 40,000,000 feet. The C. P. R. Co. has expended $200,000 in clearing and street-making, and will expend some hundreds of thousands more in round-houses and other buildings. The assessed value of the company's property in the city is about $1,000,000 while some twenty-five other owners are taxed on an assessment of another million.

On Burrard Inlet is the Hastings saw-mill, which cuts fifteen million feet per year, and during 1886 shipped seven million feet to Valparaiso, Shanghai, Melbourne, Sidney, Adelaide, Callao and Iquique, or other ports in Australia, South America and Mexico. The Chemainus mill is on the east coast of the Island, and cuts say twelve million feet per year, three-fourths of which was last year used for the Esquimalt and Nanaimo Railway. At New Westminster and at Vancouver are the Royal City mills, consisting of two concerns which have a capacity of some twenty millions yearly and also make sashes and doors, shingles, laths and boxes. They have three steamers, fifteen barges, and employ over 400 men. At the mouth of the Brunette River, on the west bank of the Fraser are the Brunette mills, which cut six million feet last year. The Moodyville Saw-mill Co. shipped during 1886 twenty cargoes of rough and dressed lumber, spars, pickets and laths, to Australia China, Japan, the Sandwich Islands and South America. Their total carriage was 11,605 000 feet rough boards; 824 000 dressed boards.

The Vancouver Coal Mining and Land Co., limited, incorporated in 1862, took over mines and lands from the Hudson's Bay Co., and has since produced nearly two million tons of coal, the yearly production ranging from 21,000 tons in 1883 to 238,000 tons in 1885. It employs some 300 men at from $2 to $3 50 per day. The Wellington mines near Departure Bay, to which their railway, five miles in length, runs, employ some 600 hands, and their output last year reached 180,000 tons.

TERRA COTTA LUMBER.

THIS new discovery, which promises to revolutionize house construction, is but little known so far in Canada, although steps are now being taken to introduce it manufacture in Montreal. In an interview with Mr. W. C. Evans, of the latter city, who is the Canadian representative of the International Terra Cotta Lumber Co., of Chicago, THE LUMBERMAN gleaned some valuable information regarding this new and important industry.

Porous Earthenwares is the generic name given to these compostions, which afford four distinct bricken products, specifically termed by the inventor in the order of their discovery "TERRA COTTA LUMBER," "BRICKWOOD," "CELLULAR POTTERY," and "HOLSTEIN," or WOODSTONE.

As a manufacture the industry may be fairly started as yet in its infancy, ten plants only having been established, but it is calculated by the managers of the company, that the erection of twenty-four more in different parts of the world will follow during the coming season. "Terra Cotta Lumber" is composed of gritless kaolinic clays and sawdust in such proportions as to afford a degree of porosity to the burned product as enables its easy working with tools commonly used in carpentry.

Its experimental manufacture, and its application as "fireproofing" was introduced in 1882, and has ever since found increasing favor at the hands of architects and builders. The other inventions are of later origin. "Brickwood" is a composition of clays, or clayey loams, and sawdust so intimately mixed and worked into form by heavy steam or hydraulic power as to render its burned product one-third the weight of common building bricks. "Cellular pottery" is a mixture of surface clays, with fibrous vegetable matter, as straw, or its equivalent, in such proportions as to enable the safe drying and burning of hollow blocks pressed into the shape of joist and timber in lengths as great as ten or twelve feet. "Holstein," or wood-stone, is so called because compositions of clay and sawdust, with sufficient straw added to furnish the required amount of fiber in their green pressed state, to overcome the tendency of the wares to crack, while drying, will safely yield large hollow blocks, for the outside walls of houses, in the place and imitation of stone weighing as much as two or three hundred pounds.

All of these wares are of course incombustible and as resistance to the action of fire as bricks, for the final process of their firing is identical. Unlike bricks, however, their great porosity confers remarkable non-conduction properties of heat, cold, and sound. It is claimed that their production can be had of any sort of clays or clayey loams; that their first cost is cheaper than "slopped" bricks; that wooden framed buildings, at no enhanced cost, may be so sheathed and protected by their application as to be as secure against incipient fires, as the usual fire-proofed structures of iron; and that such construction affords the comfort of houses of brick in northern countries and of wooden in hot climates.

The compounding with clays, of vegetable and carbonacious matter, to a moderate degree, which by the firing process assists in fueling or to lighten the weight of the burned product, is not an unusual practice, but the invention of processes of manipulation which allows the introduction of vegetable matters in such proportions, as to themselves after ignition serve as fuel without other to properly bake the clay; or to create a product of brick, that may be wrought with wood working tools; or to tie together green clay wares with fibres so effectually as to overcome cracking tendencies in drying, the most trying stage of their manufacture; or to work clays from their original place of deposit to delivery to the wares in the drying-room by machine processes without the intervention of hand labor undoubtedly is new to the clay-workers of all countries, and combined will unquestionably form he basis for an industry, which in future importance may outrank even brick-making.

In the illustrated little works, given free distribution by this company, and descriptive of the novel manufacture and application of the wares for architectural and fire proofing purposes, the author says in reference to their production in Western towns, where, as building materials they are needed for the adjoining country and where in a measure their manufacture could reinstate a local business destroyed by the too liberal establishment of market towns of competing railroad systems, a business which would afford employment to its citizens and keep the money usually spent abroad for building material at home.

"Thus from the nature of things the industry can not be cheapened by new inventions, or by improvements on old ones. Wherever new buildings are erected, and burned ones are replaced, there exists the market. The material is made at home, sold at home, and the demand for it never satiated.

"In forest countries a saw-mill may be found in every settlement, sometimes two or three. Its presence assures the nucleus of a future town; its pine lumber productions are utilized in the building of it; its employes are citizens. The forest which supplies terra cotta lumber lies out of sight, beneath the feet.

"The dirt which the builder throws out in the excavation of his cellar will build the house which is to surmount it. If the making of pine lumber be a profitable manufacture, why not of porous earthenwares under like circumstances? A twenty-five tone plant, the smallest which can be economically operated, may be erected with the facility and cost of a portable saw-mill. Twenty-five men are required to run it; twenty-five townsmen, neighbors, men with families—men who make homes for themselves, and spend their earnings at home.

If a reasonable porportion only of what is at present claimed in favor of this new manufacture prove true, the introduction of the art as a new industry will confer benefits incalculable upon communities in vastly more ways than one.

The pine forests of our country are rapidly disappearing. With their eradiction follows the race of lumbermen, and the wide spread traffic subsidary to their labors. Will the hybrid production of brick and wood here spoken of, measurably take the place of lumber? Will its manufacture compensate idle hands, the losses sustained by the abolishment of their former occupations?

The invention of new material or composition of matter, is of rare occurrence. Still rarer where its supply to the world even requires an output greater than the capacity of one or two manufactories. But if for the interior of buildings are required, as seems to be the case, more bricks for partitions, walls, and floors, if used for that purpose, than is demanded for the erection of outer or weather walls, the substitution of porous enathenware for lathed and plastered constructions alone, being lighter in weight, cheaper, and every way preferable would cause the building of a factory in every town which now supports a brick yard.

WOOD-WORKING PATENTS.

The following list of patents relating to the Wood-Working interest granted by the U.S. Patent Office, February 25th, 1887, is specially reported by Franklin H. Hough, Solicitor of American and Foreign Patents, 925 F street, N.W., Washington, D.C., who will furnish copies of patents for 25 cents each.

356 460,—Saw-set,—H. Flater & A. L. Davis. Findlay, Ohio.
356 462.—Saws, Adjustable Guide for band,—C. Gail, Chicago, Ill.
356,482,—Planing-Machine,—H. A. Lee, Worcester, Mass.
356 509,—Lathe,—L. W. Spencer, Hoosjack Falls, N.Y.
356,583,—Sawing-machine,—T. E. Goodwin, Nashville, Tenn.
356,678,—Lathe,—J. J. Brewlis, Minneapolis, Minn.
356,693,—Stump-extractor,—R. B. Montgomery, Montour, Iowa.
356,820,—Saw handle,—C. W. Boynton, Brooklyn, N.Y.
356,920,—Saw-mill, Band,—J E. Emerson, Beaver Falls, Pa.
356,931,—Saws. Machine for setting and truing band,—J. E. Emerson, Beaver Falls, Pa.
356 973,—Log-dog,—E. H. Aldmen, Mobile, Ala.
357,032.—Saw-mill net works,—W. L. Raynes, Montezuma, Ind.
357,087,—Saw mill feed-mechanism —A. B. Landis, Waynesborough, Pa
357,091,—Saw filing machine,—R. Nolon, R. W. Bishop & J. Waltemeyer, Colorado, Texas.
356,182,—Sawing-machine, Circular,—H. M. Darling, Seneca Falls, N.Y.
356,336,—Saw-gummer,—E. Rogers, Fulton County, Ind.
357,437 —Chuck, Lathe,—J. H Westcott, Oneida, N.Y.
357,454,—Plane, Bench,—J. Brice, Sandy Hill, N.Y.

It will pay you to advertise in The Canada Lumberman.

THE WHITE AND CHESTNUT OAKS OF THE ATLANTIC FORESTS.

NORTH AMERICA is the headquarters of the oak genus. No less than thirty-seven species occur within the limits of the United States, and about fourteen of these can be found in Pennsylvania and New Jersey. The lumber yielded by these varieties is by no means of equal quality. This fact is well known to all lumbermen and lumber dealers and workers, but not all of these classes are acquainted with the growing trees of various ages, so as to be able to tell them apart. By the characters of their leaves the oaks of the United States may be divided into (1) white oaks, which have leaves cut up into rounded lobes; (2) chestnut oaks with toothed but not lobed leaves; (3) live oaks, the leaves of which are evergreen; (4) willow oaks, with entire, narrow deciduous leaves; and (5) black and red oaks, in which the veins of the lobed leaves project beyond the end of the green lobes as so many bristles.

Six distinct species of white and chestnut oaks, destitute of bristle points to their leaves, are found in Pennsylvania and New Jersey, but the live or evergreen oaks have their habitat further south.

Among the oak of the eastern states none exceed the white oak (*Quercus alba*) in an average of all the qualities which make a tree desirable. Pieces of the wood of this tree, four centime tres (1½ in.) square, and eight times that length, were found to have an ultimate resistance to longitudinal compression of 8 183 kilograms, and to transverse strain of 386 kilograms

In strength, hardness and durability, few oaks surpass this, and the economic value of the tree is enhanced by its wide distribution and large size. From Maine and Ontario to the St. John's river and Tampa bay, Florida; and from the ocean to Missouri, western Arkansas and the Brazos river, Texas, the white oak is abundant on all soils, and attains large dimensions. It is most abundant, and reaches its greatest development along the western slopes of the Alleghanies and in the valley of the Ohio, where it often forms more than half the forest growth, and reaches a height of from 80 to 140 feet, with a diameter of from 4 to 8 feet.

The acorn cup is hemispherical much shorter than the ovide acorn, which is edible, and about an inch long, and the leaves are cut into either from three to five board lobes, or into five to nine narrow ones.

It must not be forgotten that there are in the United States four other quite distinct kinds of oak which bear the name of white oak. Two of these are, however, confined to the coast region of the Pacific; a third, *Q. oblongifolia* extends in Arizona, New Mexico, and Mexico; while the fourth is peculiar to the latter regions.

The post oak or iron oak (*Q. obtuesiloba*) belongs to the same section with the white oak, and its lumber exceeds that of that species in specific gravity and resistance to indentation, but is inferior in elasticity, and slightly so in resistance to transverse strain and longitudinal compression. But the tree is comparatively small, at its best rarely exceeding eighty feet in height and three to four in diameter, and usually much smaller. The wood checks badly in drying, but is very durable in contact with the soil, whence, probably, its name of post-oak. It is the most common and widely-distributed oak of the Gulf states west of the Mississippi, ranges north to Massachusetts, south to Florida, and west through southern Ontario and Michigan to eastern Nebraska, Kansas and to the hundredth meridan in Texas. The acorns are very much smaller than those of white oak, not exceeding two-thirds of an inch in length, and the acorn cups cover only about one third of the fruit. The upper and larger lobes of the leaves are broad, and are often slightly notched.

The burr, mossy cup or over-cup oak is a tree equal in size to the white oak, to which its lumber, from the experiments made upon it in 1881, is superior in resistance to indentation and to transverse strain, but inferior in elasticity and resistance to compression Its specific gravity is about equal to that of white oak, and it is said to be of all oaks the most durable in contact with the soil The lobes of the leaves are often toothed, but the characters by which the tree may most readily be distinguished are the depth of the acorn cups and their covering of printed scales, the uppermost of which are prolonged into awns, forming a mossy fringed border.

Northward this oak ranges to Nova Scotia and New Brunswick, but it does not appear to extend further south than Lancaster county, Pennsylvania. Northwest it ranges along among the Atlantic oaks to the foothills of the Rocky mountains of Montana, and southwest to the valley of the Nueces river, Texas. It loves rich bottoms and prairies, and in the prairie region is the principal growth of the "oak openings."

Another oak which attains dimensions equal to those of the white oak is the swamp white oak (*Q birolor*) a tree which loves deep alluvial soil upon the borders of streams and swamps. By the older botanists, it was confounded with the chestnut oak. From southern Maine and the most southern part of Ontario this tree ranges south to Delaware and west to southwestern Iowa and western Missouri, while along the Alleghanies it extends even into Georgia. The wood is slightly heavier than that of the white oak, which it very nearly equals in elasticity, hardness, and transverse and longitudinal strength. The leaves of this tree are broader, and are unqually and more deeply toothed than those of the chestnut oak, and the scales upon the acorn cups are more pointed.

Quercus Prinus, the chestnut or rock chestnut oak, is one of the most valuable timber trees in Pennsylvania. Its range is from the Blue Hills of eastern Massachusetts to Delaware, and along the Alleghanies to Northern Alabama. In size it is inferior on the whole to the white oak, yet occasionally reaches nearly 100 feet in height, with a diameter of three to four feet. In the southern Alleghany region it forms a large portion of the forest growth. Slightly inferior to that of the white oak in transverse strength and hardness the lumber is superior to the latter in transverse strength and hardness. The wood is durable in contact with the soil; and the brick is rich in tannin. The leaves of this oak are uniformly dontate, with rounded teeth, a character by which they may be known from those of the chestnut which have pointed teeth. The acorns are large and thick, with thick hemispherical cups.

Very nearly allied to the chestnut oak is the yellow chestnut oak or chinquapin. This tree has been described under two names, as two distinct pieces, owing to the fact that, east of the Alleghanies, it is seldom found except in the form of a low shrub, the slender branches of which are often stretched flat upon the ground by the weight of the clustering acorns. West of the Alleghanies this oak attains a height of 80 to 100 feet, or occasionally even more, and a diameter of from two to three feet. It is found upon low, rich bottoms, and also upon dry hillsides. The presence of the dwarf form, which often grows in company with the Bear oak, a dwarf oak with bristle-pointed leaves, is proof of the barrenness of the soil. The leaves of the yellow oak are narrower than those of the rock chestnut oak, and the teeth are pointed instead of rounded, thus rendering the resemblance to those of the chestnut still closer.

This species ranges from the shores of Lake Champlain to the Delaware, and along the Alleghanies to Alabama and Mississippi, while westward it extends to eastern Kansas and Nebraska, and southwest to the Gua dalupe mountains, Texas. It reaches its greatest development in southen Arkansas, and is very common in the Mississippi basin.

Although this tree is comparatively little known, its wood, according to the experiments made for the purposes of the census, is, in fuel value, hardness and both transverse and longitudinal strength, greatly superior to that of any of the oaks mentioned, while in elasticity it is inferior only to the rock chestnut oak. It is very heavy and exceedingly durable in contact with the soil, but checks badly in drying.—*W. N. Lockington, in Journal of Progress.*

ESTIMATED LOG CROP.

Careful estimates of the log crop of the streams tributary to the booms, which furnish logs to Bay City and the Saginaws, the present winter place the amount at nearly 600 000,000 feet. Of course it is not presumed that the figures are absolutely correct; but it is thought they will approximate very nearly to the actual amount when the figures are all reported officially:

	Feet.
Tittabawassee and tributaries	400,000,000
Cass, Bad and Flint	8,000,000
Kawkawlin	20 000,000
Saginin and shore pine	10,000,000
Riffe river	90,000,000
Au Gres	55,000,000
Total	583,000,000

THE LUMBER TRADE.

A. G. VAN SCHAICK, the well known Chicago lumber merchant, has been unburdening himself to a reporter of the Chicago *News*, and we make some very interesting extracts from his remarks which follow. They embrace almost every phase of the lumber trade:

"Why, the local consumption of pine and hardwood lumber alone in Chicago is 700,000,000 feet annually, and so long as this is a railroad center there will be an outside trade.

"Some of the largest lumber manufacturers are removing their business from Chicago to their mills. That is, the manufacturers live and sell their product here, but have it forwarded direct from the mills by rail to the purchaser. Thus they save the expense of maintaining yards and handling the stuff in the city.

"The lumber question does not cut any figure in the change that is going on. I have not met a dealer who is grumbling about strikes. Those that occurred last summer of course delayed business at the yards, but they lasted only a few days, and after they were over every merchant went to work and soon caught up with his orders. In a large city, where there are always men out of employment, a strike cannot last many days. And, as matters are shaping themselves now, pressing orders can be filled direct from the mills when labor troubles interfere with the work here.

"The capital invested by Chicago lumbermen exceeds $60,000 000. This includes the money put into pine lands, mills and machinery, vessels, and the hundred and one ramifications of the trade. The Chicago yard trade alone represents about $30,000,000 capital, and employs 14,000 workmen on an average for the year round and 17,000 in the busy season, including the crews of the vessels that bring the lumber here. The local sales, however, only reach about $32,000,000 a year a little more than the largest dry-goods merchant in the city sells in the same time.

"Notice the changes in the lumber industry at other points. In 1886 the shipments from Green Bay ports directly to the east were 80,000,000 feet. This season they will reach 100,000,000 feet or more. All this pine product is diverted from the Chicago market, where it would ordinarily be sold. A few years ago nearly all the stuff manufactured in the Green Bay district came here, and it was a rare thing to hear of a cargo going east This movement from that quarter is increasing every year. The same is true of all lake ports from Manistee to Duluth. Why? Because the Saginaw river and Canada are no longer able to supply the eastern demand. Timber is getting scarce in the Saginaw river section. The great primeval forests of standing pine in eastern Michigan have been cut off, and there is to-day an excess of saw mill machinery at Lake Huron ports. Sales of standing pine in the Saginaw river region are quoted at $5 to $8 per thousand feet. This is a very high price. A resident of Detroit told me he paid $12 for stumpage near the Saginaw river, but that is an exceptional case. In two instances last year log-run lumber sold for $23.50 and over per thousand feet in Saginaw. That is very dear. Last season logs were towed from Marquette, Lake Superior, to the Saginaw river, to be manufactured into lumber.

"The Saginaw river is still the largest manufacturing market in the northwest. It produces and ships nearly 800,000 feet annually. The merchants there see, though, that this cannot last. They are already reaching out into other sections. More than $1,000,000 of Bay City and Saginaw capital was invested in standing timber in the Menominee district, Green Bay, last year. One lumberman paid $712.000 for a single tract and has built a saw mill at Green Bay City.

"On the east shore of Lake Michigan standing timber or stumpage is now selling at $4 at Traverse City to $8 per thousand feet at Manistee or Muskegon, the range being governed by the location and quality of the pine. On the west shore of the lake and along Lake Superior prices range from $3 to $6, the first in northern Wisconson and the last in the Green Bay region. These are just about double the prices of three years ago."

"What is the prospect for the lumber trade this coming season?

"The outlook altogether is very satisfactory. The winter has been a fine one for work in the pineries. There is plenty of snow all through the timber country and the men in the camps are actively at work. The reports indicate that the log supply will be a little excessive. Against this large stock of logs is the fact that the supply of old lumber on hand is less than a year ago. It is 10 per cent. less in two of the largest distributing markets—Minneapolis and Chicago—and a little less on the Saginaw river. There were also few logs left over last autumn. The probable liberal demand for lumber and the smallest stocks led the trade to think that prices will not fall below the present range. The average sales of lumber the last year show an average of 10 per cent. above the prices of the previous year, and in this same time standing timber advanced 20 per cent., or $1 per thousand feet, which about equals the rise in the manufactured product.

"The manufacturers of the western district which includes Michigan, Wisconsin and Minnesota, will probably reach 8,000,000.000 feet this season. This would wholly remove their timber from 1,000 square miles of territory."

THE WASTE OF WOOD.

It has been estimated by competent persons that, comparing the dead weight of a tree as it stands in the forest with the dead weight of the lumber that is obtained therefrom, not more than 25 per cent. is actually delivered in the timber market. The remainder consists of limbs and slabs, roots and edgings, and buttings and waste in general, in the forest and at the sawmill. However extravagant and wasteful the timber trade may have been in time past, it may now be noted with satisfaction that, owing to the increased demand in various directions for these so-called waste products, it is likely that the proportion utilized will be reversed, and the loss not exceed 25 per cent., even if it reaches that amount. This is especially due to the growing uses for wood pulp, which now enters not only into the manufacture of paper,—in itself a vast industry, but also finds employment in many other directions of almost equal magnitude.

The lumber dealers of New York have formed a corporation under the name and style of "The New York Lumber Trade Association," the objects of which are: "To foster trade and commerce, to reform abuses in trade, to protect trade and commerce from unjust and unlawful exactions, to diffuse accurate and reliable information among its members as to the standing of merchants, to acquire, preserve and disseminate valuable information relating to the lumber interests of this and the surrounding cities, to produce uniformity and certainty in the customs and usages of trade, to settle differences between its members, to establish rules for inspection, and to promote a more large and friendly intercourse between merchants.'

WANTED.

The publisher of the CANADA LUMBERMAN desires thoroughly reliable and competent correspondents at the following named places:—

Kingston, Ontario.
Quebec City, Quebec.
St. John, New Brunswick.
Halifax, Nova Scotia.
Winnipeg, Manitoba.
Victoria, British Columbia.

The duty of each correspondent will be to give a review of his local market for the month preceding the date of issue, and the ruling quotations for different kinds of lumber, &c. For terms and any other information, address

A. G. MORTIMER,
Peterborough, Ont.

TRADE REVIEW.

TORONTO.

TORONTO, FEB. 26.—The state of the lumber trade in this city is much the same as at the time of last report. There will be nothing new to report until the breaking up of winter, and building operations commence. Prospects are good for the coming season's operations, and should the large number of public and private buildings, for which contracts are being let, be pushed ahead early in the spring, our lumber merchants may safely look forward to a good trade. Prices rule the same, but it is thought by some that an advance may be expected in certain classes of building materials.

The following are the ruling quotations in this city at present:—

Mill cull boards and scantling	$10 00
Shipping cull boards, promiscuous widths	12 00

MONTREAL LUMBER MARKET.

MONTREAL, Feburary 24th

Business in the lumber trade in Montreal has been slack during the month of February, but quotations have remained steady. There has been nothing of a special interest to give it animation, while there has been sufficient to account for the dullness. Unfavorable country roads, caused by snow blockades, the general holiday time of our carnival, and the absorbing interest centered in election affairs have all had their quieting effect upon business. The general outlook for the spring, however, is bright, and there are rumours that several factories are to be put up, which had been held in abeyance, pending the result of the elections.

The following are the imports of lumber into Montreal during 1886:—

Per River St. Lawrence	15,703 907 feet.
" Lachine Canal	61,732 000 "
" Grand Trunk Railway	16,512 000 "
" Canadian Pacific Ry	13 266,000 "
Total	107 213,908

The following are the quotations of the yards here:—

CHICAGO.

From Our Own Correspondent.

We have had a hard winter up to the present time, the weather being either extremly cold or very stormy, for the lumber trade, but still the output will equal if not exceed that of last winter, and prices are quite firm, especially on coarse lumber. The outlook for the coming spring is promising, and unless we have a general strike of the labor classes I am of the opinion we will have a good spring trade. Chicago as a lumber market is gradually losing ground year after year, and a great many of the dealers are of the opinion that it will never regain its lost trade. The principal causes seem to be the gradual growing trade of Southern Yellow Pine and the extension of railroads into the manufacturing districts, so that lumber can be piled and seasoned at the mill and shipped direct, which, of course, is a saving, as expenses of handling, piling yard, rents, &c., are much higher in Chicago than they would be at the manufacturing point. Last season was about the worst one Chicago has seen for some years, and I predict that two more such years as last following right along would drive from 25 to 50 per cent. of the wholesale dealers out of the yard business here. As it is we have had something like half a dozen firms go out last spring, and there will be as many more go out the coming spring in all probability.

The lumber trade is done somewhat different here from what it is in the east. We have here what is called the "lumber market" which is simply a district near the mouth of the Chicago River where the cargoes arrive and are consigned to commission men to be sold. All you can see of it is a portion of the deck load and the "tally sheet" which is simply straight measurement, consequently you can't tell whether you have made a judicious purchase of any cargo you may buy until you have it sorted up in your yard, as no lumber is sold here by the manufactures by inspection.

The lumber for this market, mostly course, comes from Muskegon, Mich., Ludington, Mich. and Manistee, Mich. A very small quantity also comes from the Saginaw District as the freight comes too high from that point. The lumber designed for this market is manufactured different from what is demanded by the eastern market and as the Canada cut is all marketed in the east I am not capable of giving you any "pointers" that would be of any use to Canadian manufacturers. There are a great amount of strips sold here and the grading is entirely different from Canada and the east. The South Branch Lumber Co. of this city now have a yard at Tonawanda, where they have undertaken to run Chicago grades, but how it works I do not know, but I imagine they will have to change things somewhat to conform with the eastern ways.

SAGINAW VALLEY.

LUMBERMAN'S GAZETTE OFFICE,
BAY CITY, Mich., Feb. 21, 1887.

There is very little to be said in regard to the lumber market of the Saginaw Valley; and "dullness," is about as expressive a word as can be written in regard to it just at present. Some attribute this to the passage of the inter-state commerce bill; but whatever may be the cause, the result is quite apparent. Some few comparatively insignificant sales have been made, but trade is not up to expectations. Mosher & Fisher sold 700,000 feet of lumber on Wednesday last at $12 $24 and $40, $10, $20 and $40 and $15 and $20. Murphy & Dorr sold 650,000 feet of lumber to Buffalo parties at $9 50, $19 and $38. C. L Grant & Co., sold a bill of lumber last week amounting to $3,000. Mill culls have advanced, and are selling at $7 and $8 in Bay City and East Saginaw. Shingles are firm; but there are few on the market.

TIMBER TRADE OF CANADA.

The special issue of the *Timber Trades Journal*, of London, Eng., contains a lengthy review of the timber trade, 1886, from correspondents at every port of importance in the United Kingdom as well as from the leading timber producing countries, the Continent and the Colonies We herewith reproduce the statements and figures furnished from Canada.

QUEBEC.

The season of 1886 has been another in the series of bad years which our Quebec timber trade has been for some time undergoing—one year worse than another, the past one worst of all.

The supplies got out last winter were full in pine in the Ottawa region, and in the spruce districts of the St Lawrence and Saguenay a fair supply was got out. These with the wintering stocks, enabled the representatives of our shipping houses last spring to present themselves before your buyers with ample lines of all classes of wood goods. It is to be regretted, however, that sales could only be effected to a limited extent, and at close out prices in most cases. It was evident that the selling season of 1886 was not going to be any improvement on that of 1885.

The Afghan dispute with Russia, which for a time assumed a very critical appearance, gave the wood trade a momentary spirt. Buyers, fearing the cutting off the supplies from the Baltic, took heart of grace, and made considerable purchases at fairly full prices. As, however, the war-cloud broke and gradually disappeared, the re-action set in, and it became almost impossible to effect sales.

The "drives" in the Ottawa regions were, on the whole, good, and the logs reached the different mills in regular and full supply during the season.

In the spruce districts the drives were not so good; in fact, on the tributaries of the south shore of the St. Lawrence the drives were almost a complete failure. On many of the streams the logs only got down with the heavy freshets of September.

Owing to the sluggish state of your markets, this does not seem, however, to have had much, if any, effect on the demand or prices of spruce deals.

The spring and summer brought us no cheer from your side; it was struggling, up hill work all through the season to effect sales with your buyers, although almost all classes of goods could be offered at low prices, and freights were unprecedentedly low.

It is a blessing the stocks here were held by strong houses, who could carry them over to another season, without being forced to sacrifice them, so prices have not been allowed to fall to any great extent, as otherwise would doubtless have occurred, owing to the deplorable state of your markets, diminished consumption, and the large competing supplies from the north of Europe.

Large lines of Michigan first—pine—were purchased the past summer at high prices by some of our Canadian houses; this was unfortunate, as your markets did not need them; it has caused a glut of firsts, which, for the first time in many years, cannot be moved at your side. They must now, of course, be held until your market can absorb them, or be sold at loss.

This will, however, prevent a repetition next year, and by next spring or summer, if any vitality is shown in your markets, things should right themselves, as the supply of first quality pine deals is year by year decreasing.

For the sake of the good old port of Quebec, we regret to have to record again a still further decrease this year in our already reduced trade in export of wood goods.

We append a comparative statement of the clearances for the past 10 years, which tells the lamentable tale.

1877	796	Vessels	670 627 Tons
1878	476	"	399 833 "
1879	433	"	364,628 "
1880	634	"	555.451 "
1881	459	"	380 186 "
1882	426	"	359 925 "
1883	487	"	416,169 "
1884	366	"	291,398 "
1885	369	"	294,789 "
1886	325	"	250,635 "

It must, however, be confessed that this does not mean that the total exports of wood goods from the St. Lawrence has fallen off in above proportion.

Many mills above Quebec, whose deals used to be brought down and shipped from here, are now delivered to ships and steamers direct at the mills, there being plenty of water and good anchorage all along the St. Lawrence, from Quebec to Montreal.

The cause especially of a considerable falling off in our Quebec shipments on this head is the fact that the great bulk of the pine deals which came from the Ottawa districts are now shipped from Montreal.

Whether exporters have made money on their deal shipments for 1886 is questionable; there can be no doubt whatever but that for our pine deal manufacturers it must have been one of the most profitable years they have ever had. They sold large lines of their cuttings to the United States, and also considerable lines of deals to European exporting houses, who were compelled to pay the mill-owners' prices or go without stocks, as the favourable state of the United States' markets rendered manufacturers completely independent of the deal buyers.

Whilst on this subject we cannot refrain from expressing the hope, in the interest of trade, that our exporting houses would in future regulate the business of the future with Great Britain to meet the reduced demand and consumption of Canadian woods in that country. This would place it on a healthy basis, and permit a legitimate profit to all concerned.

Any attempt to force on the markets of Great Britain the quantities of wood goods which were possible to be shipped in the halcyon days of the past, at living profit—because the demand and consumption were there where these latter no longer exist—cannot end otherwise than disastrously.

The log cutting this year in the Ottawa district will, from all accounts, be even more extensive than last year's, as the mill-owners look forward for a large and more prosperous year's business with the United States than even 1886.

There seems to be no halt in the onward progress of our big neighbour. Each year the volume of the trade exceeds that of the preceding year. There were probably the largest supplies of lumber from her own manufacturers, and including supplies from Canada, the past year than in any previous year in the United States; but notwithstanding many drawbacks from labour strikes and other causes, there seems to be consumption for all; and with some vibrations in prices during the season, it closes with reports of moderate stocks from all sides, good prices, and brilliant outlook.

In view of our declining trade with Great Britain, which we cannot but deeply regret, the advantages of a new market such as that of the United States at our doors, are such as we cannot help congratulating ourselves on.

In spruce deals it is probable that the new cut will about equal that of last winter. We cannot, however, see how spruce deals can be made to sell at the miserable prices now ruling in your markets. No doubt the low prices ruling with you are due, first, to diminished consumption; and next, to the abundant supplies at low prices of North of Europe whitewood We fear our spruce manufacturers will eventually have to give up trying to compete with the Baltic, and seek other markets for the disposal of their deals

The winter all over Canada has been very severe, extremely cold, and snow in abundance, rather too abundent for working to advantage in the woods; but, on the whole, it may be called a very favourable winter for log making and hauling, and we have no doubt the most will be made of it by our lumbermen.

OTTAWA.

The shipments of lumber which take place yearly from Ottawa value far up into the millions. The outlook for the coming season is most flattering. All the lumbermen are unanimous in stating that the cut this season will not be below the average, while two expect to double their cut. The amount of lumber manufactured during the past season was in advance of that manufactured during any previous year, and it is clear that the amount manufactured next year will show another large increase. The amount of lumber manufactured by the Ottawa mills during the past season is as nearly as possible 288 000 000 cubic feet. The greater quantity shipped has been sent to the United States, but almost all the coarsest grades were consigned to Montreal for home consumption. The principal destinations of the consignments to the United States were Burlington, Vt, Albany, New York and Boston. Excepting in a few cases where consignments were shipped via Montreal direct to England, but little export trade was done from Ottawa, save to the United States. A large proportion of the lumber sent to the United States has been exported thence to South America, the West Indies, Africa, and other foreign markets The prices of lumber in the various markets fluctuate according to the freight charged from Ottawa, the lumber being sold there on a basis of about 16 dollars per thousand superficial feet, to be delivered on the cars or barges, all freight charges to be borne by the purchaser. During the past season nothing has been done in square timber. Hardwood is not touched by Ottawa lumbermen except occasionally for private use.

ST. JOHN, N. B.

I have nothing to add to my last communication to your *Journal*. There has so far been very little snow along the bay shore, and operators are unable to do much in the way of getting out logs; in the upper part of the province there is I understand, an abundance of snow, and work in that section is progressing very favourably.

I hand you below a statement of the entire shipment from the New Brunswick ports for the year. I am indebted to the *St. John's Globe* for the figures, and you will notice they are so arranged as to show the shipment for 1885 as well as 1886.

WOOD EXPORTS.

The total export of deals &c., from St John trans Atlantic ports in 1886 shows a large falling off compared with last year. The figures are as follows, showing the ports to which the lumber was sent and the names of the shippers :-

Years	Port.	No of Ves.	Tons.	Sup feet deals, &c.

MINING REGULATIONS

To Govern the Disposal of

MINERAL LANDS OTHER THAN COAL LANDS,

1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron, or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting, for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode, or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron, on veins, lodes, or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mines.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provide for the character of the survey and the marks necessary to de ignate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations the claimant shall, within sixty days thereafter, file with the local agent in the Dominion, Lands Office for the district, in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt, it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operation on the same; but the claimant is required before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE cash, and the sum of FIFTY DOLLARS extra for the survey of same.

Not more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.—The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area, which shall be bounded by north and south, and east and west lines astronomically, and its breadth shall equal its length, Provided, that should any person making an application purporting to be for the purpose of mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The Regulations also provide for the manner in which land may be acquired for milling purposes, reduction works, or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1885, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect of quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The regulations apply also to

RED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS.

Contain the *forms* to be observed in the drawing up of all documents, such as:—"Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location" "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed-rock Flume Company." "Grant for Drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulation to govern the disposal of Dominion Mineral Lands, the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

WORKING CLASSES ATTENTION! We are now prepared to furnish all classes with employment at home, the whole of the time, or for their spare moments. Business new, light and profitable. Persons of either sex easily earn from 50 cents to $5.00 per evening, and a proportional sum by devoting all their time to the business Boys and girls earn nearly as much as men. That all who see this may send their address, and test the business, we make this offer. To such as are not well satisfied we will send one dollar to pay for the trouble of writing. Full particulars and outfit free. Address GEORGE STINSON & Co., Portland, Maine.

WHOLESALE and RETAIL
HARDWOOD LUMBER
MERCHANT
Car Lots sold on Commission, railway switch into yard and plenty of room for storage. Yard corner of Stachan and Wellington Ave. Office, 9 Victoria St. Telephone Connection.

GRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
'By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast table with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*"
Made simply with boiling water or milk. Sold only in packets by Grocers, labelled thus:
JAS. EPPS & Co., Homœopathic Chemists.
London, England

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.

General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.
MANAGER—WILLIAM SMITH.

General Offices—Court St., Toronto, Ont.

Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from misrepresentations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.

W. SMITH, Manager.

TORONTO
SEND FOR PRICES

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for New Examining Warehouse, &c., Ottawa," will be received at this office until TUESDAY, 1st March, for the several works required in the erection and completion of the

New Examining Warehouse, &c.,

—AT—

—OTTAWA.—

Plans and specifications can be seen at the Department of Public Works, Ottawa, on and after MONDAY 14th February.

Intending contractors should personally visit the site and make themselves fully cognizant of the work to be done, according to the said plans and specifications, before putting in their tenders.

Persons tendering are further notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque, made payable to the order of the Honorable the Minister of Public Works, *equal to five per cent.* of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest of any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works, Ottawa, January 27th, 1887.

The Canada Lumberman

SPECIAL EDITION

We have now in course of preparation the FIRST ANNUAL SPECIAL EDITION of the CANADA LUMBERMAN,

Six Thousand Copies

Of which will be issued ***Friday, 1st April, next,*** and circulated among the trade throughout Canada, United States and Great Britain.

This issue of THE LUMBERMAN is intended to surpass, both in size and variety of contents, anything heretofore produced by the trade press of Canada. Arrangements are being made whereby every Province in the Dominion will furnish a complete budget of news of interest to every man engaged in the lumbering and wood-working branches of trade. The state of trade and the prospects for the coming season's business will be discussed in all its bearings, while the list of technical contents will be unusually large and complete.

No such opportunity has ever before been offered MANUFACTURERS OF SAW-MILL AND WOOD-WORKING MACHINERY, WHOLESALE LUMBER DEALERS, Etc., to introduce their business to the Canadian Trade. The tariff of advertising rates for this edition is so low that anyone desirous of doing business in this country should have their announcement prepared and duly forwarded.

From the rates specified below, advertisers will note that, if a series of insertions are ordered, they will gain all the benefit of the special issue of ***6,000 COPIES*** at the ordinary charge :

Tariff of Rates for Special Issue :

Two Pages	$44 00	*Quarter Page*	$8 00	*Three Inches*	$2 75
One Page	25 00	*Eighth Page*	5 00	*Two Inches*	2 00
Half Page	14 00	*Five Inches*	4 25	*One Inch*	1 25
Third Page	10 00	*Four Inches*	3 50		

(Size of Page 9″ x 12¼″)

Advertisers contracting for half or whole page advertisements can have descriptions of machinery and illustrations of same inserted among reading matter at the rate of $5 per column. Those not having displayed advertisements will be charged $8 per column among reading matter.

We beg to remind you that during the months of April and May Canadian lumbermen are fitting up their mills for the season's trade ; discarding old machinery and putting in new ; and for this reason, at no other time during the year will an investment in advertising pay as well.

As the time is short, and as all matter and advertisements must be in the hands of the printer by the 20th March, in order to insure proper classification, all who feel disposed to favor us with an order, should see that the same be handed in not later than the date mentioned.

Remittances may be sent with order, payable to A. G. MORTIMER, Peterborough, Ontario, or within thirty days of completion of contract.

LOWEST RATES FOR CONTRACT ADVERTISING FURNISHED ON APPLICATION

It is to the interest of every man in any way interested in the great lumber industry of Canada to assist in making this special issue of THE LUMBERMAN a success.

PUBLISHED MONTHLY By A. G. MORTIMER. | *The only Newspaper devoted to the Lumber and Woodworking Industries of the Dominion.* | SUBSCRIPTION $1.00 PER ANNUM.

VOL. 7. PETERBOROUGH, ONT., APRIL, 1887. NO. 4.

AN ACT RESPECTING THE DRIVING OF SAW LOGS.

QUITE a stir has been occasioned in lumber circles regarding the bill recently passed its first reading in the Ontario Legislature respecting the driving of saw logs and other timber on lakes, rivers, creeks and streams. Deputations of lumbermen have already gone to Toronto to interview the Government on the matter, making objection to some of the provisions of the bill. The result of these interviews will not likely be known until after the present issue of the LUMBERMAN. We publish the Bill in full, however, and will have more to say regarding the matter in a future issue. The Act reads as follows :—

1. Any person putting or causing to be put into any lake, river, creek or stream, in this Province, any saw log or other timber for the purpose of floating the same to the place of manufacture or market shall make adequate provisions, and put on a sufficient force of men to break jams of such saw logs or other timber in or upon such lake, river, creek or stream, and to run or clear the same from the banks or shores thereof, and to run or drive the same so as not to hinder the removal of any saw logs or other timber from the banks or shores thereof nor obstruct the floating or navigation of such lake, river, creek or stream.

2. In case of the neglect of such person to make such adequate provision, and put on such sufficient force of men, as aforesaid, it shall be lawful for any other person engaged in floating or running saw logs or other timber in such lake, river creek or stream, obstructed by reason of such neglect, to cause such jams to be broken, and such saw logs or other timber to be run, driven or cleared from the banks of such lake, river, creek or stream, and along and down such lake, river, creek or stream, at the cost and expense of the person owning such logs or other timber, and such owner shall be liable to such persons for such costs and expenses.

3. The person so causing such jams to be broken, or such saw logs or other timber to be run, driven or cleared, shall have a lien on such saw logs and other timber, for his reasonable charges and expenses for breaking jams, and running, driving and clearing the same, and shall be entitled to take and retain possession of such saw logs or other timber, wherever the same may be found, or so much thereof as may be necessary to satisfy the amount of such charges and expenses, and all costs, and may after thirty day's notice to the owner, if the owner be known, and advertisement thereof for three successive weeks at least once in each week, in a newspaper published nearest to where such saw logs or other timber may then be, sell by public auction, subject to the lien of the Crown (if any) for dues, the said saw logs or other timber, or so much thereof as may be necessary to satisfy the amount of such charges and expenses, and all costs, rendering the surplus on demand to the owner.

4. If the owner of the saw logs or other timber is not known to the person claiming the lien, then such person may after advertisement thereof for four successive weeks, at least once in each week, in the *Ontario Gazette*, and in a newspaper published nearest to where such saw logs or other timber may then be, sell by public auction the said saw logs or other timber or so much thereof as may be necessary to satisfy the the amount of such charges and expenses and all costs.

5. Any person whose saw logs or other timber in any lake, river, creek or stream, in this Province, are so intermixed with the saw logs or timber of another person, that the same cannot be conveniently separated for the purpose of being driven or floated to market, or place of manufacture, may drive all saw logs and other timber with which his own are so intermixed at the cost and expense of the person owning the same, unless such owner furnish a fair proportion of plant and men, and do or cause to be done a fair proportion of the work necessary to be done in driving all the said saw logs and other timber, so intermixed, and such owner shall, unless he so furnishes a fair proportion of plant and men, do or cause to be done a fair proportion of the work in driving said saw logs and other timber as aforesaid, be liable to such person for such costs and expenses, and such person shall have a lien on such saw logs and other timber for his reasonable costs and expenses for driving the same, and shall be entitled to take and retain possession of such saw logs or other timber, wherever the same may be found, or so much thereof as may be necessary to satisfy the amount of such charges and expenses and all costs, and may sell the said saw logs and other timber in the manner mentioned in the sections hereinbefore contained, but subject to the provisions as to notice and advertisement thereof as in said sections mentioned.

6. If the owner of the said saw logs or other timber shall dispute the amount claimed by a lien holder he shall, within five days from the receipt of the notice of sale, to be given by such lien holder to such owner, give notice in writing to such lien holder, that he disputes the amount claimed and thereupon the following proceedings shall be had unless the parties otherwise agree upon the amount to be paid :

1. Such notice shall state the name of an arbitrator and call upon the lien holder to appoint an arbitrator on his behalf within five days after service of such notice, and in default of such lien holder making such appointment it shall be lawful for the Judge of the County Court of the county, or the Stipendiary Magistrate of the District, as the case may be, in which such saw logs or other timber are situate upon request of the owner to appoint such arbitrator, and the two arbitrators so appointed shall forthwith appoint a third arbitrator in the matter ;

2. If after the arbitrators have been appointed, as aforesaid, they fail or neglect for the space of five days to appoint a third arbitrator, the said Judge of the County Court or Stipendiary Magistrate shall, within four days after a request in writing made upon him by either of the two arbitrators appointed as above, appoint a third arbitrator ;

3. The arbitrators may require the personal attendance and examination on oath of the parties and their witnesses and the production of all documents relative to the dispute, and may determine by whom the expenses of the arbitration shall be defrayed, together with the amount thereof, and shall make and deliver their award and determination within twenty days from the date of their appointment, and the said lien holder, may retain his lien and possession of the said saw logs and other timber until such award is made and delivered, and the amount found thereby and costs is paid by such owner to such lien holder.

7. If the owner does not forthwith pay the amount and costs which the arbitrators determine that he shall pay, such lien holder may proceed to sell by public auction the said saw logs or other timber, or a sufficient portion thereof, to satisfy the award and cost, and the subsequent costs of and incidental to such sale, first giving notice of such sale by advertisement for two successive weeks, at least once in each week, in a newspaper published nearest to where such saw logs or other timber may then be.

8. Any person whose saw logs or other timber are intermixed in any lake, river, creek or stream with the saw logs or timber of any other person, and who for any reason desires to separate the same, or does not wish to continue the drive, shall at his own cost and expense separate his said saw logs and timber from the saw logs and timber of such other person, and securely boom the same to one side, in such manner as to allow a free passage for the saw logs and timber of any other person who may wish to continue the drive.

NEWS NOTES.

Prof. John Macoun, Botanist to the Dominion Government, intends leaving for British Columbia about the first week in April, where he expects to remain until September next. Readers of THE LUMBERMAN may expect some interesting correspondence during the next few months.

A sale was completed a short time since by Mr. Donald Campbell, of Colborne, Ont., to Mr. Thos. P. Pierce, of Belleville, and Mr. Joseph Pierce, of Norwood, of the pine only upon 100 acres of land in the township of Otonabee, Peterborough county, the price paid therefore being $10,000. Messrs. Pierce are now busily at work taking out this pine as square timber for the Montreal market.

Two or three wealthy Michigan lumber companies which own large quantities of pine in Ontario will import a considerable quantity during this year, notwithstanding the Canadian export duty. A single raft of 3,000,000 feet was put together in Georgian Bay last autumn, and will be started for Saginaw on the opening of navigation. The Dominion tax will, it is said, be removed whenever lumber is put on the free list of the American tariff.

Permits to take out ties and wood in Ontario along the Canadian Pacific railroad have been granted by Crown Timber Agent Margach, of Port Arthur, to the following Winnipeg parties : Dennison Bros., whose permit covers the district from the Manitoba line east to Eagle river ; Egan Bros., to cut 125,000 ties in the district extending from English river to Savanne. The Hudson Bay company are also applying for a permit.

The Pontiac & Pacific Junction Railway promises to be one of the most important lines of railroad in the province. They have now employed a large gang of men on the work of construction. Application will be made by the company at the next session of parliament, for amendments to their charter. The amendments will include an extension of time for the completion of the road. The acquiring of timber limits in the Ottawa district, the working of saw mills, extending the railroad through the Province of Quebec to Sault Ste. Marie, crossing the Ottawa river in the county of Pontiac, a short distance west of Pembroke, and extending the line to Mattawa if necessary. To validate and confirm the agreement between the Canadian Pacific railroad for the purchase of the Aylmer branch of that road and to relieve that branch from all mortgages and charges.

THE MANUFACTURERS SPEAK.

Some Interesting Correspondence Concerning Prospects for the Coming Season's Trade.

From A. & P. WHITE, Pembroke.

We have cut about 3,000,000 ft. saw logs, and 1,000,000 ft. dimension timber at Duex Riviere. Part of this will be sawn at Duex Riviere and part at Pembroke.

From T. A. KIDD, Burritt's Rapids.

There will be about 500 to 1000 saw logs taken out here, all used for local improvements; 5000 to 7000 railway ties; 15,000 to 20,000 cedar fence posts; 200 cords cord wood.

From ONTARIO LUMBER CO., Toronto.

We have cut during the past winter about 28,000,000 feet of logs. This will be manufactured into lumber at Midland, French River and Gravenhurst. The prospects for the next season's operations are satisfactory.

From W. E. TENCH & SON, Chippawa, Ont.

The timber in this locality is fast being cleared out. Pine has already been cleared. About 200 M Oak, together with probably 100 M of Elm, Ash, &c., will be a fair estimate of the season's cut. The outlook points to a high price for oak.

From MANHARD & COMPANY, Brockville, Ont.

Business opens well. More orders booked now than at any time during the past three or four years. Some American customers feel a little shy over the Retaliation Bill. A fair crop of logs taken out this season, but I fancy not as many as people generally suppose.

From JOHN VANNOSTRAND, Aurora, Ont.

We have just about finished logging for this season. Have got in 7000 pcs., consisting of Pine, Hemlock, Basswood, Maple, Oak and Elm. These logs when cut will make about one million ft. We do only a retail trade now, as our standing timber is very limited and there is no more to be had in this locality.

From T. S. DOBSON, Harriston, Ont.

All the mills in this neighborhood are only small country mills and do not amount to much, as the timber in this part is pretty well cleaned out. They usually run along most of the winter and stock up from 500M to one million. Buyers are on the road enquiring, but seem charry of closing at marginal prices.

From W. B. & S. ANGLIN, Kingston, Ont.

Saw and Planing Mills: We manufacture about 2,000 Hemlock logs (Standard); 1,000 Baswood logs (Standard); 1,000 Pine logs (Standard); 500 Ash logs (Standard); 500 Elm logs (Standard); 200 Maple logs (Standard); 10 thousand cubic feet of pine, ash, and other lumber. We handle about 1000 cords of cord wood.

From the MUSKOKA MILL AND LUMBER CO., Bracebridge.

The cut this winter will be about 10,000,000 feet, with 2,000,000 of last year's stock on hand. This year's stock was principally cut in the townships of Franklin, Wood and Gibson, the season has been very favorable for taking out logs. Preparations are now being made for driving and the mills will start as soon as Navigation opens.

From CASSELMAN, Ont.

Logging operations have not been as extensive as was anticipated last fall, owing to the unfavorable nature of the season. It is probable that the cut for the present summer will be from 2 to 3 millions less than last year which was about 11 millions. Prospects are an improvement on last spring as orders are coming in very freely. Mills will probably commence work some time in April.

From J. HADDEN & SONS, Foxmead, Ont.

Our manufacture is almost entirely confined to Bill Timber, which we are now manufacturing up to fifty feet in length. We have the only steam logging railroad in this part of Canada, and bring our logs direct from the woods in this way. We also operate a shingle mill in an adjoining building. The output of lumber averages 1,000,000 feet each season. Prospects for this season are good.

From M. BRENNAN & SONS., Hamilton.

In reference to logs and lumber prospects we think through out the Muskoka and Parry Sound Districts, the prospects for a fair stock is very good. The season has been favourable and most of the lumbermen will have full stocks. For ourselves, we have got out about 12 millions, which we hope to get all safely down the rivers and manufacture at our two mills, together with a large quantity of shingles both XXX and XX.

From B. CALDWELL & SON, Lanark, Ont.

The fall of 1886 was unusually good for log cutting on the upper Mississippi, and also on the Madawaska River. The winter months have been very good for hauling and the drawing was up early. However, the snow was too deep for cutting and upon the whole, consider the quantity of logs cut this season, 1886-7, will be somewhat less than the year previous, especially in that part of the country named. Consider the prospects for business during the coming spring favorable.

From CALABOGIE, Ont.

There has been a change made in the firm of Francis Carswell & Co., whose mills are situated on Calabogie Lake, with limits in the vicinity, Mr. Francis having sold his interests in limits and mills to Mr. E. MacKay, of Renfrew. The business will be carried on under the firm name of Carswell, Thistle & MacKay. A busy season is anticipated. There are sufficient logs at the mills to last until the new logs arrive, and everything is in order to begin operations as soon as the ice breaks up. Estimated cut for season 8,000,000 feet.

From THOS. OUELLETTE, Gordon Ont.

The output of logs for Essex and Kent, of oak, ash, balsam, sycamore, maple and a small quantity of chestnut will be about 18 million feet. There is a very large quantity of elm, put out for hoops and staves. Although we had about six weeks of sleighing it came so early that the mill men were not prepared for it, which accounts for small output. Demand for lumber is very good and business looks good for the coming season. Think there will be a large quantity of logs put out this season on trucks, &c.

From GREEN & ELLIS, Fenelon Falls.

We have only the two firms operating here now in lumber and shingles, ourselves and Messrs. Thompson & McArthur, which are taking out about their usual stock. Thompson & McArthur will start cutting custom stuff about the first of April, Green & Ellis will start their mill about the first of May. They have about one and one-half million feet of lumber on hand, composed of shipping lumber and bill stuff of all kinds, which they are shipping to all points in Canada and United States. Prices from $6 to $16 per thousand feet.

From J. K. WARD, Montreal.

I think that there will not be over two-thirds the usual quantity of logs got out this winter, in the part of the country I am operating in, *a.e.*, the River Rouge, P. Q., the snow being at least five feet deep in the woods, making it very expensive lumbering, where the timber is scattered. I am told that there will be at least 25 per cent. shortage of logs on the Ottawa, and not more than one and a half million feet (cubic) of timber got out, with a prospect of any amount of water for driving. Demand for lumber bids fair to be good the coming season.

From DICK, BANNING & Co., Keewatin.

Our winter operations will be about six million feet, this we intend sawing, as also three-quarters of a million on hand, and one and a half million of logs, part of drive hung up. Providing the proposed dam is built at the falls near Rat Portage, a heavy sawing season is expected. The season promises to be an unusually busy one. Demand is firm at present with every indication of a good season's trade. Stocks are decreasing at all points here and west. From reliable reports the proposed large Grist Mill will soon be commenced, and points to a large influx of settlers for this place.

From MESSRS. BERTRAND & Co., Quebec.

The three planing mills which prepare wood for the retail trade here in Quebec are well enough employed. The local retail trade is only middling and appearances for the future are not bright. The pine that is in demand here is deals of 2 inch, 1½ inch, 1¼ inch and 8 inches and up, 1st and 2nd quality, and the consumption is limited in our old city of Quebec. We would be glad to have an address where we could purchase Hardwood, Walnut, black and soft; Cherry, Birch, Ash, Basswood, &c. As for news we await your interesting journal to find that, and the opening of navigation to give a little life to our trade.

From PERLEY & PATTEE, Ottawa.

The present winter has been the worst for logging operations known in this part of Canada for many years; the snow has been exceedingly deep with a heavy crust and the slush on the lakes has been troublesome throughout the winter. In consequence of these drawbacks the cut of logs will be fully 10% less than anticipated, which must make the cut of lumber for 1887 less than 1886. The prospects of the lumber trade for 1887 are exceedingly good (the strikes in the United States being the only uncertain element in the situation,) and we look for an advance in prices, particularly in the lower grades.

From THE MUSKOKA MILL AND LUMBER CO., Toronto.

The Company's operations this winter have been confined to the Muskoka river and lakes. Their stock, with the logs wintered over, will be about fourteen million, including long timber. It would have been larger but for the great depth of snow in the woods and the crust which is severe on the horses. The Company are getting the Hamilton Manufacturing Co., of Peterborough, to put up a Band Saw Mill for them, which they hope will prove a success, and save much good lumber going into saw dust. The mill will probably start about the middle of April, or as soon as the ice breaks up. The prospect for the season is considered fair although the price of common lumber is still low.

From TRAIN & SON, Burk's Falls.

The Victoria Harbor Co. will have a 5,000,000 feet drive to go over the Magnettewan to the Georgian Bay this season. Train & Son will manufacture here about 2,500,000 feet, part of which will be put into shingles. E. H. Smith will also have sawn here about 500,000 feet of basswood. Business throughout will be lively. The only thing this place lacks to make it a splendid point, is proper switch accommodation.

From DAVID ROSS, Whitemouth, Man.

In compliance to your request for a report of this season's cut of timber, the following is as near the mark as can be given:—G. H. Strevel, ties, 300,000; Wm. S. Reade, ties, 75,000; McKinty & McKinnon, ties, 30,000; J. Ferguson & Co., ties, 40,000; David Ross, logs, 2,000,000 feet, besides a large quantity of cordwood. This has been a remarkably fine winter for work. The camps will be closed up here next week.

From P. O. BYRAM, Madawaska, N. B.

Our log hauling from the stump was done some time ago, but considerable yet to haul off of yards. The repeated snow storms has prevented a good bottom being made to roads, and it is doubtful if all will be got off of yards. A falling off of fully one third of lumber may be expected, owing principally to the large quantities of snow. American lumbermen hang on still, slaughtering our cedar, to manufacture on the American side, leaving the best half of the lumber in the stump only to the depth of the snow, but they pay no export duty for slaughtering our forests, and can afford to lose heavily in the getting, but that don't save the destruction of our lumber. It's a piece of outrageous blindness to allow our forests to be slaughtered yearly to build up American enterprise at the sacrifice of our own.

From GODERICH, Ont.

Firms doing business here the past season are: Williams & Murray, H. Secord, Diment & Company, Jno. D. LeBel. W. & M. and D. & Co., manufactured their own stock, the former at Blind River, the latter at Thessalon. The other purchase from mills North of this and on the Georgian Bay. The amount of business done has been rather small, probably did not exceed ten million feet by all the dealers (4). Their market extends from Goderich to London, St. Thomas, Port Colborne, Guelph, Norwich, and intermediate points, with occasional shipments of better qualities to the United States. Lumber consists principally of white pine, with some few small cargoes of Norway or Red pine. Prices for the past season have remained very steady, about as follows, f. o. b. cars here:

W. P. Mill Culls	$ 8 00
" Common Stocks	11 00
" Last and Scantling	11 00
N. P. Joist and Scantling	10 to 10 50
" 1¼, and 1½ in. Flooring	13 50
W. P. Dressing	16 00
" 1 in Clear and Picks	24 to 26 00
" 1¼, 1½, 2 in Picks	33 to 35 00
" Lath, 1½ in., 4 ft	1 85 to 1 90

Very few shingles come here by water. Dealers supply their customers direct from mills on the Midland and N. & N. W. R'ys. Williams & Murray, who have been in the business since 1867, have just dissolved partnership, the senior partner continuing the business. They sold the Blind River Mill and limits to Lawton Bros., of Toledo and Geo. A. Butterfield of Alpena, who compose the new company of "Blind River Lumber Co." They expect to get out about five million feet this season on the Blind River, which will go to Toledo. Diment & Co. may get out from six to eight million at Thessalon, which will likely be brought to Goderich for distribution.

MANITOBA AND THE NORTH WEST.

—The Canadian government is establishing agricultural stations in the northwest provinces, and a special feature of these stations will be the attention paid to the forestry. As large a variety as possible of fruit and forest trees will be tested with a view to future forest planting in the prairie sections. For the more rapid distribution of desirable varieties of trees, a nursery will be started for their propagation, and the distribution of such as may be found adapted to the climate.

—In the district of Alberta, in the Northwest, all the timber limits under license, except one, are situated west of the meridian of Calgary, and chiefly on the Red Deer, Rosebud, Bow and Clearwater Rivers, and upon the Old Man's River north of Fort Macleod. The average amount collected for dues in the Calgary agency amounts to about $5,000 annually, and for bonuses for timber berths along the Bow and Kanaskis Rivers, the large amount of $62,426.61 was received at this agency in one year.

Advertise in the Canada Lumberman, it will pay you.

NEW BRUNSWICK MATTERS.

INTENSE excitement prevalled in St. John when the announcement was made that the Maritime Bank had suspended payment. No definite cause for the failure has yet been made public, the managers in St. John being yet reticent on the subject. The suspension has been severely felt in Fredericton, where stock is held to the extent of $50,000 or $60,000. It is said that the suspension was caused by the carrying of heavy lumber operators through a period of financial embaraassment.

The St. John *Globe* says: "The Maritime Bank has been an unlucky institution almost from the start. A large portion of its original capital disappeared long ago in the interest of one or two individuals. It had in its experience of one or two large lumber operators a warning that should have satisfi d it of the shoal water in which it was navigating, but this seems to have had no effect upon it, for now it appears to be irretrievably wrecked on a dangerous reef which its past experience should have taught it to avoid. The reserve and almost mystery which surrounds the break-up, and which the reporters seem to be unable to penetrate, seem to justify the fear that the suspension means a very bad failure. Some large lumber firms are heavily involved.

Advices to the St. John press stated that Guy, Bevan & Co., timber merchants, of-Mobile, Ala., were protested in London on the 9th inst., on a £1,000 draft. Attachments have been issued at Mobile on the property of the firm to the amount of £17,000.

Friday evening's *Globe* stated: "To-day it became known that Messrs. Stewart had placed on record on the 9th inst. a transfer of valuable property in Gloucester county to the New Brunswick Trading Company. On the 10th inst. there was placed on record a bill of sale of the same property to the People's Bank, Fredericton. The latter document was dated in 1884, but was never recorded."

A despatch from Montreal to the same paper says:

A large seizure has been taken out by the firm of J. R. Greenshields & Guerin, acting for the Maritime Bank, St. John, against the timber and other property of J. Stewart in Ottawa district. The seizure is for $500,000.

It is said by Messrs. Stewart that instead of their being a source of weakness to the bank they have on more than one occasion been the means of saving it from suspension. Some years ago on the suspension of Messrs. Carvill, McKean, & Co., the bank would have suspended payment had not Messrs. Stewart provided $70,000 or $80,000 to enable it to tide over the run made on it at the time. The Stewart firm claim that very considerable assistance has been rendered by them on more than occasion to the bank.

Mr. Thos. Maclellan, president of the Maritime Bank, arrived home on Sunday morning's train from Montreal. He stated that his visit to Montreal was for the purpose of arranging for the seizure of the Stewart property.

It has transpired that on the 11th inst., a bill of sale was fyled, transferring all R. A. & J. Stewart's deal, property and schooners at St. John to the New Brunswick Trading Company. This includes a quantity of deals in the barks "G. H. Gordon" and "Young Eagle." These deals were furnished from Messrs. F. Tufts & Co.

The following is the order in which the recent bills of sale and deeds have been recorded in the registry office at Bathurst

(1) Bill of Sale: R. A. & J. Stewart to New Brunswick Trading Company, dated March 7th, 1887, recorded March 9th, 1 887; consideration, $38,500, viz.: 3 wood-boats, 10 shares Restigouche Boom Company's stock and 10 debentures Restigouche Boom Company: mill requisites and supplies; trade requisities; 1 fire engine; booms; lumber licenses: 4 shares Miramichi Steam Navigation Company's stock; household furniture; logs in Tetagouche river (estimate), 736,000 sup.ft.; logs in Millstream river (estimate), 1,550,000 sup. ft.; logs in Grant's Brook (estimate), 375,000 sup. ft.; spruce and pine deals and other sawn lumber, 1,982,000 sup. ft.; logs at Jacquet River Boom, 87,000 sup. ft.; spruce logs and birch timber on the Big and Little Tracadie rivers and Pokemouche river (estimate) 5,000000 sup. ft.

(2) Deed dated 31st December, 1886, recorded 9th March, 1887; John Stewart to N. B. Trading Company; consideration $43,400, viz.: The "farm" formerly owned by Hon. John Ferguson, the "homestead" formerly owned and occupied by Hon. J. Ferguson, the store, wharf and mill property, engines, boilers, furnaces, mill machinery, booms and water and all other privileges connected with the mill.

3. Bill of sale dated 7th August, 1884, recorded 10th March, 1887, R. A. & J. Stewart to People's Bank, Fredericton—consideration $1, and also in consideration of advances made or to be made, viz.: All cows, horses, grain, etc., on the "Farm." All stock in store, books and book debts, notes, [illegible] in action, etc. Also, all logs and lumber to be manufactured from the logs.

4. Deed dated 4th April, 1883, recorded 10th March, 1887, John Stewart to A. F. Randolph, president of the People's Bank, Fredericton consideration$ 1, and also in consideration of advances made or to be made the "Farm" the "Homestead," the store, wharf and mill property, dwelling houses, etc., etc.

The Tracadi mill property was transferred to the New Brunswick Trading Co. in 1886, and duly recorded.

LEGISLATURE NOTES.

Mr. Park, in a recent address in the Legislative Assembly, referred in the following terms to the question of stumpage: "Some years ago the speech at the opening of the house used to refer to the depression in the lumber trade. Why is no reference made to the matter now? The question of stumpage is one that concerned the bread and butter of many persons in this county, of many in all the northern counties. Kent and Restigouche, Gloucester and Northumberland were opposed to the government's high rate of stumpage, and candidates in these counties during the last election expressed themselves in favor of a reduction of that stumpage. He hoped that members from the southern and western parts of the province would not think lightly of this stumpage question. It was one of vital importance to the people of the north. During the past four or five years since the government's high stumpage was imposed the value of mills that cost $70,000 had been reduced to $40,000 and less. To show how the stumpage affected the lumber trade of the north he would give some figures in reference to the shipments of lumber from North Shore ports during the past few years. In 1883 there were shipped 149 millions, in 1884 the amount was 108 millions, in 1885 the shipment fell to 87 millions and last year to 72 millions, or a difference of over one-half during the four years. That falling off meant that $160,000 less was spent for getting out logs, sawing of lumber and the hauling of the same than four years previously. Everybody was interested in that—the man who goes to the woods, the man who works in the mill, the man who loads vessels and the merchant. Some one will tell us, no doubt, that this falling off in the shipment of lumber is due to a general depression in the lumber industry. But what do the shipments from Nova Scotia show? In '83 there were shipped from that province 77 millions; in '84 69 millions; in 1885 79 millions, and last year 87 millions, or in other words an increase in Nova Scotia during four years of 13 per cent., while the north shore trade has fallen off over 50 per cent. during the same time. During the provincial elections the canvass was used that the government intended to give a rebate on the stumpage, and he read from a circular issued from Mr. Snowball to show that members of the government have led lumbermen to believe that such a rebate would be allowed. He hoped that the member or members of the government who had made such a promise to the lumbermen would have the manliness to say so now. The government say that they charge the high rate of stumpage in order tr raise a revenue, but he would remind the house that when the stumpage was 80 cents the revenue obtained was greater than it is at present,"

* * *

In debate on supply Mr. Hutchison contended that lumber at the North Shore and particularly in Northumberland county was greatly handicapped and that in the matter ot laths alone there was a difference in the favor of the southern part of the province ot 60 per M, the average rate at the North Shore being 80 cents and at St. John $1.40. Replying to the query of the solicitor general why don't the lumbermen in Northumberland ship their small lumber, the speaker said that they do ship a great deal. This was the only way they had to get rid of it. But it was here again that the North Shore was unfortunate as the freight from the North Shore was about three times as great as it was from St. John. Last year the shippers of his county had to pay $6 on lumber and $1 on laths, while it was a well known fact that in St. John last season laths were shipped to New York at 40 cents per M.

The Provincial Secretary—What are your rafting charges?

Mr. Hutchison said that depended to a great extent on the river. On an average the rafting, delivery and other charges cast us about $1 per M. The North Shore is also handicapped on account of the severe labor that is necessary to get logs to market. While rafting on the St. John may be more expensive, the removal of logs cost less than at the North Shore. With regard to the assertion that there were more small operators now than ten years ago he said such was not the case. The great evil the small operators complain of in Northumberland county is that the small operators do not hold the land and they can't get it. He was a small operator himself. All he could get was twelve miles. He did not blame the increased stumpage for this, but he blamed the system of crown lands management for it. This is exactly the charge he had to bring. In 1886, in Northumberland, Gloucester and Kent counties there were 2,386½ square miles of lumber lands held, from which stumpage to the amount of $65,139.29 was paid, all of which came out of these counties. The whole of this area was held by nineteen gentlemen. Noticing this fact and that these people have the monopoly of the land for ten years, he failed to see the point of the solicitor general's argument that there were more small operators now than ten years ago. He disputed the fact that in the county of Northumberland there were more small operators [illegible] years ago; indeed th re were less. Under the old system if a man wanted certain land [illegible] the auction the next year and he would get them. Now he has got to wait seven years. In [illegible] in Northumberland county he found one man who held 68 [illegible] and paid a yearly rent for stumpage per mile of $[illegible] including the $4 for renewal of lease, amounted to $22.10. Of the 2,386½ miles held in this county he figured that the average stumpage was $27.29 per mile, and $4 per mile for renewal, which gives the government only about two per [illegible] for their investment. This he did not consider fair management. He finds that one man holds 249 miles and that he pays thereof only $25.10 per mile. Another man who holds 19 miles pays $106.60. This on the face of it appeared uniust and unreasonable. Then, again, another individual has 197½ miles and he pays in stumpage $39.30 per mile. Another one holding 39 miles pays $21.54, another holding 406 miles contributes $35 per mile. Another with 72½ miles pays $4.02, while there is another holding 70 miles who pays nothing at all. If this was fair he failed to see it. The crown land should not be shut up to monopolists. The evil is the small operators have not got the land and cannot get it. It was monstrous that all the lands in his county should be held by nineteen individuals and that they should hold it for a period of ten years. The reduction of stumpage would not help matters in this respect. It was a fact, however, that in the campaign the president of the council had in effect stated that the government would just manipulate things so that the lumber would get 25 per cent. off. The country wasn't going to know anything about it. The reduction would be made and nobody would be the wiser.

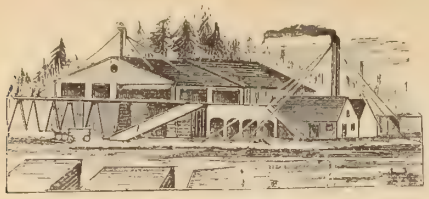
WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U.S. Patent Office, up ot March 20th, 1887, is specially reported by Franklin H. Hough, Solicitor of American and Foreign Patents, 925 F Street, N. W. Washington, D.C., who will furnish copies of patents, for 25 cents each.

358,474,—Shingle-sawing machine,—P. O'Connor, Ludington,
358,495,—Veneering Wood,—J. H. Spedman, Cortland,
358,550,—Saws, Feed-rool for gang,—W. Harvey, Arnprier, Canada.
358,607,—Lathe tool holder,—C. E. Hall, Brick Church, N.J.
358,678,—Wood, Ornamenting,—A. Komp, New York, N.Y.
358,772,—Saw,—J. E. Emerson, Yonkers, N.Y.
357,582,—Saw-mills. Carriage feed-mechanism for,—A. Cunningham, Milwaukee, Wis.
357,595,—Saw-tooth swage,—D. G. Hadley, Fitchburg, Mass.
357,678,—Saw Guide,—J. W. Maxwell, Louisville. Ky.
357,679,—Saw-mill band,—J. W. Maxwell, Louisville, Ky.
357,680,—Sawing-machine. Scroll,—J. W. Maxwell, Louisville Ky.
357,681,—Saw-mill band,—J. W. Maxwell, Louisville, Ky.
357,810,—Lumber-binder,—W. Baynes, Buffalo, N.Y.
357,818,—Lumber-binder,—A. R. Clark, Buffalo. N. Y.
357,866,—Saw-tooth swaging device,—J. A. Shull, Poplar Bluff, Mo.
357,913,—Saw-gummer and sharpener,—C. Eidelbach, Faltonia, Tex.
358,003,—Saw-mill. Combined band and circular.—E. W. Turner and J. Reynolds, Blexwich, England.
358,026,—Saws. File for band,—J. E. Emerson, Beaver Falls, Pa.
358,045,—Shingles. Machine for dressing,—H. Lightner, Neff's Mills, Penn.
358,069,—Saw-tooth swaging machine,—S. A. Parke, Bay City, Mich.
358,159,—Saw-mill dog,—T. Manley, Nevada, Mo.
358,173,—Sawing-machine. Circular,—C. J. Sturgeon, Nilos Grove, Pa.
358,217,—Saw-filer and Gummer,—I. H. Palmer, Ledi, Wis.
358,328,—Saws. Apparatus for removing gum from.—J. C. Ballew, Evansville, Ind.

There are 89 logging railroads in Michi[illegible] of 475¼, and equipped with 127 locomoti[illegible]

The Glasgow correspondent of *Timber*, says:—"There are not many transactions taking place in timber, and although deals are moving pretty freely, prices are still keeping at the low level. The Quebec merchants are finding it rather uphill work in making business of it this year, so far as I can learn. To the Clyde little or nothing has yet been done, and it does not appear as if there will be much business, for Spring shipment at least. The usual contracts for cargoes to the coast ports have mostly been fixed, and they are pretty well spread amongst the shippers. As one or two contracts are still open, it is premature to say who has been most successful."



The Canada Lumberman

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. MORTIMER, PETERBOROUGH, ONT.

Terms of Subscription:

One copy, one year, in advance $1 00
One copy, six months, in advance 0 50

Advertising rates furnished on application.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER, Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least six clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co , 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

ANNUAL SPECIAL EDITION.

PETERBOROUGH, ONT., APRIL, 1887.

A LARGE amount of editorial, correspondence and illustrated matter, has unavoidably been held over until the next issue.

STEWART & Co., of London, Eng., and St. John, N. B., have entered an action against the *Star* newspaper for $100,000 damages for an alleged libelous article in connection with the Maritime Bank, of St. John, N. B., and for half a million dollars damages against the Bank of British North America, for alleged damages sustained by the bank refusing to accept one of their checks.

THE New York *Lumber Trade Journal* is one of the latest additions to our exchange list. It is a semi-monthly publication of thirty pages, and is full of interesting matter pertinent to the lumber trade. Notwithstanding the fact that this journal is only in its second year, and has opposition to fight in every direction, it seems to be holding its own and enjoys a large advertising patronage.

No trade journal published in the South has made greater progress than the *Southern Lumberman*, of Nashville, Tenn. Being the only paper in the Southern States devoted to the saw mill, lumber and machinery interests, it has a wide field to cover, and it is making the most of its opportunities. Published semi-monthly at $2 per year. Free sample copies will be sent to any address on application.

THE Maguire failure has, it is claimed, turned out much more serious than was at first expected, and has now been thrown into court. The assets are pretty well included in the securities given to cover secured claims, therefore the balance of the creditors will not likely get a cent. It is generally stated that two or three Canadian banks are greatly to blame for the way this firm has been allowed to carry on business.

IN view of the success of the experiment made in the direction of preventing such immense losses of timber by fires as have occurred in past years and the strong pressure to continue the service and make it more effective, the Crown Lands Department of Ontario has determined to do so and extend it, which will necessitate an increased vote. It is confidently assumed, however, that any judicious expenditure in this direction will meet the approval of the Province at large.

THE WM. HAMILTON M'F'G CO., of Peterborough, Ont., have arranged with Wm. M. Wilkin, of Erie, Pa., to build his patent Compensating Balance Gang, for the Dominion of Canada, of which a full description will be given in our next issue. They have built and are now shipping one of their New Improved Oscillating Iron Gangs, with gate 54 inches wide and 8 inch crank, for the Charlemagne & LacOuareau L. Co., Charlemagne, Que. This is the same style of gang that they put in last season at Three Rivers, Que., Little Current and French River, Ont., and which gave such good satisfaction.

It is said that Mr. Peter McLaren, the well known lumberman, retires, after a business career of about twenty-five years, with a fortune of a million and a half of dollars. He will probably take up his residence in Toronto, where, it is said he purchased a handsome residence some time ago. It is stated by the Perth *Courier* that he is willing to invest some of his money in a blanket factory in that town. The sale of his property includes everything except the lumber in the yards at Carleton Place.

THE past month has been a disastrous one in certain lumber circles in New Brunswick, as in addition to the failures reported in another column of this paper, we are also called upon to add the name of Geo. McLeod, ex-M.P. for Restigouche, which took place on March 25th. Mr. McLeod was one of New Brunswick's largest lumber operators, but the failure was not unexpected. No statement of liabilities or assets are yet to hand, nor the names of the heaviest creditors. The official reason of the failure is said to be the suspension of T. C. Jones & Co., of Liverpool, which firm held all Mr. McLeod's freight moneys, and large sums of his also, to accruing liabilities. The suspension of this business will be a heavy blow to St. John, where he employed a large number of laborers on his vessels. His lumber operations were chiefly on the North Shore, which will suffer heavily.

A CURRENT newspaper telegram from Ottawa, Ont., chronicles the fact that assurances have been made that the federal government proposes to liberally subsidize the Ottawa ship canal scheme. The project is to shorten the distance between the west and the seaboard, by a direct and continuous water route, by the utilization of Lake Superior, Sault Ste. Marie, North Passage, Georgian Bay, French river, Lake Nippising, connecting and neighboring lakes, and the Ottawa river to the St. Lawrence and the ocean. The plan requires some improvements on the upper Ottawa, and the digging of about 21 miles of canal. Take a look at the map and see what a short cut from the west to the Atlantic the proposed route makes. Of course it is only a summer route, but it will stay open as many months as the "Soo." It is said that this project is original with C. H. Plummer, of East Saginaw, Mich., who at one time was admitted to the Canadian Parliament and there presented his plans.

DURING the past month an extensive sale has been effected between Mr. Peter McLaren, of Perth, one of the most extensive and best known lumbermen in Canada, and Mr. W. E. Edwards, M. P., Mr. James McLaren, president of the Bank of Ottawa, and a number of other gentlemen. The whole property belonging to Mr. McLaren was transferred to the new company, which will be known as McLaren & Edwards. The bill of sale included limits, mills, etc. The limits, which are situated in the counties of Lanark, Frontenac and Addington consist of about three hundred square miles. There is one mill on the K. & P. railway, besides the mills in Carleton Place. The price paid is said to be in the neighborhood of $900,000. Mr. Peter McLaren was one of the representative lumbermen of the country, and his resolve to go into private life has caused considerable surprise. His successors, however, are also well known among the trade, and the indications are that the business will not suffer under the new management.

WE herewith present our readers with the first annual special edition of THE LUMBERMAN, which although by no means as large as we had hoped to have made it, nevertheless contains a very large amount of carefully prepared matter of interest to the trade in general. It was not until after our announcement had appeared concerning this special edition that we fully realized that the same should have been issued earlier in the season. To a great extent this accounts for a much larger number of pages not having been added, and for this reason in particular, and also from the fact that the time allotted us was too short to allow of the preparation of many reports which were intended for this issue, that many omissions may be noticed. We take pleasure, however, in drawing attention to the extensive improvements we have made in the typographical and general appearance of the paper. The new dress of type used for the first time on this issue is from the well-known foundry of Miller & Richard, Edinburgh, Scotland, while the fine toned paper now used is furnished by Messrs. Buntin, Reid & Co., of Toronto. Improvements necessarily come slowly, but by persistent effort, and through the kind assistance of the trade, we hope to fully carry out the prospectus published last fall on our assuming control of THE LUMBERMAN. This issue is intended to find every lumberman and mill-owner in Canada whose name appears on the commercial reports, and we would respectfully ask that a careful reading be given it in every case. We believe that we are not asking too much when we solicit from every man in the trade his subscription to this the only lumber journal published in Canada. It may not be out of place here to mention that the annual special edition of this paper will hereafter be issued on the first of February of each year, and that before that time next year it is hoped that the young 'un of to-day may have grown to a healthy child.

FROM the official reports issued by the Commissioner of Crown Lands for Ontario, we learn that the accounts for timber dues, bonus, ground rents, etc., for the year 1886, amount to $742,029.64, and the total collections under same heads amount to $715,804.61. The total collections during the year from woods and forests is $715,304.61, which includes $147,471.00, payment of bonuses on sale of timber berths of 22nd October, 1885, which became due in 1886. This sum being deducted leaves $568,333.61 as revenue proper from timber dues, ground rents, etc. The amount collected is in excess of 1885, and of the estimated receipts for the year, and may fairly be taken as indicating that transactions in sawn lumber in 1886 have been of increased volume; that sales have been more readily effected, and on improved terms, as compared with the previous year. For the year 1887 the forecast is an increase in the cut of saw logs, and a diminuation in the manufacture of square and waney pine. The market in the latter has been dull for the past year or two, sales of any importance being confined solely to the largest and finest timber, small sized and inferior pine being almost unsaleable except at greatly reduced prices.

WESTERN papers in the States are publishing a special despatch from Ottawa stating that a story of "inhuman brutality and damnable wrong" done to women in the lumber camps of the Upper Ottawa has come to light from Desert. It is alleged that "a gentleman from Pembroke Ont., two or three weeks ago made a trip into the lumber region to investigate the report," and found it true. Every-one who knows anything of the lumber camps will know the story to be a wretched lie. The Pembroke *Standard* takes the trouble however to deny it categorically, and continues:—"Very likely the despatch is the work of a journalistic scamp at Ottawa, who for months past has been making a disreputable living by sending sensational despatches from that city to the American press, everyone of which, on investigation, turns out to be lies. This is no doubt the fellow who invented the story some months ago about a famine in Labrador, who later got up a report about an Indian rebellion in the North-West, and in November last put in circulation the story about the murder of a whole family at White River, on the C. P.R. Even many respectable Canadian papers were deceived by the White River story, so circumstantial was it, and complete in all its details; but the whole thing was nevertheless a fiction pure and simple. This Desert iniquity, we are convinced, is another of the same sort, viz., a pack of lies."

WE desire just here to have a few words with the old-time readers of THE LUMBERMAN, and also the three thousand new ones whom we expect to peruse this issue. We desire to become acquainted not only with the business workings of every lumber manufacturer and dealer, and planing mill man of the country, but also make ourselves acquainted personally with all with whom we do business in any way. In other words we want to make the CANADA LUMBERMAN the mouth-piece of every man engaged in the trade, and take pleasure in repeating our oft-repeated invitation to the trade in general to use these columns. No matter how diligently we may work to make this journal a success, we cannot expect to make it thoroughly representative without the individual and combined assistance of our friends throughout every province of the Dominion. Every Canadian manufacturer who has a spark of ambition, is working at the present moment with the object of making his manufacture second to none, and especially equal, if not superior, to that produced by our neighbors across the border. We have the same object in view, and desire in the near future to see this journal the *accepted* organ of the great lumber trade of Canada, and on a par with any of our big American exchanges. This can be done if even a limited support is given it by the great bulk of the lumbermen of the country. The question "What are we expected to do?" may present itself to some of our readers. That question is easily answered. In the first place we want your name on our subscription list. The commodity will only cost one dollar per year. In the second place we want to receive a few lines from you occasionally letting us know what you are doing and the general state of trade. Now how many of those who are not now regular subcribers will send in one dollar, with a few lines of news? We do not believe in repeatedly making appeals to the trade for support, and therefore hope that this may have the desired effect. We want your assistance, and in return we promise to do our share towards making THE LUMBERMAN a journal of which the Canadian trade will justly feel proud.

EXPORT OF SAWLOGS.

Manifestly it is not to the advantage of either the lumberman or the people of Canada that sawlogs should be cut in our forests and then be conveyed to the United States to be there manufactured into timber. It is not fair to our mill owners, workingmen and others who thus lose the profit of this business, and the competition is especially unequal as our neighbors impose an import duty upon our lumber. Our remarks apply more especially to the pine of the Muskoka and Algoma districts, as it is here that there are symptons of an intention to carry on these operations on a large scale; here they are especially obnoxious and here they ought to be capable of being checked. On our south east frontiers, where logs, especialiy spruce, are taken down small rivers to mills across the border, there may be more difficulty in checking the practice and in some cases it may be less objectionable, so that it might even be tacitly permitted.

The Dominion authorities moved in the right direction last session when they raised the export duty on sawlogs. Having provided the remedy every effort should be made to see that it is applied.

It is quite as much the affair of the Provincial Government to see that the local industries are not starved and ruined by unfair foreign competition, that the resources of the country are not used to enrich foreigners in preference to our own people. It is time that the Province, as such, has nothing to do with export duties but it has jurisdiction in another way, for it is the property of the Province that is in question. Our timber limits are held by lumbermen who are licensed to cut the timber on certain conditions. There should be no insuperable difficulty in the way of divising an agreement of which one condition should be that the sawlogs should be manufactured into lumber in this country and not abroad. Of course it would have to be drawn carefully so as not on the one hand to restrict the export of square timber, spars, &c., nor on the other hand to leave a loophole open for the evasion of the prohibition to export sawlogs. The penalty for non-compliance might be either the exaction of increased dues if the logs were manufactured, abroad, or even the forfeiture of the limit. The officials who now see to ascertaining and collecting the dues, might without additional cost see to the observance of this condition.

The only objection that could be raised to such action on the part of the Province, is that it might be prejudicial to the Provincial revenue by preventing the competition of foreign millowners for the limits, and so having a tendency to lowet their value when put up to auction. But this would not be a sufficient reason, since the increased bonus would be dearly purchased, for the benefit of the home manufacture would far outweigh any gain from this source. The Province when disposing of its property would clearly have both the power and the moral right to make such a stipulation, so no objection could be raised under that head.

It is obvious from the official returns that the export duties previously imposed have not been very rigorously collected. Now that the necessity for action is recognized, as is manifest from the step taken last year of increasing the duty, there is less likelihood of neglect in this respect. It has been said that the great extent of our lake shores and the sparse habitation of the timbered districts would render the collection of the export duty almost impossible and very costly. In this opinion we cannot agree; both governments have various officials who might be instructed to protect the common interests in this respect. Any limit holder breaking the law would run the risk, or rather would face the certainty of incuring the penalty, for his limit would be there as securety for the payment. Then to convey the logs across the lake a tug would be necessary. If it were rendered liable to forfeiture for towing logs from our territory without reporting to the proper authority, its first trip would have to be its last.

It is only right that our forests should not be depleted for the benefit of foreigners at the cost of our own people, and if a little energy is displayed such an injurious practice can be checked.

"PLEASE MENTION THIS PAPER."

A recent issue of our sprightly exchange, *The Builder and Woodworker*, contains some excellent advice to advertisers bearing the significant title given above. It is so good that we present it in full below:

"Please mention this paper." This line stares the reader in the face in many advertisements, in all classes of papers and periodicals, and the request is, in the majority of cases, not complied with. Why should it be? Many advertisers get the idea that no better scheme was ever devised to test the real value of any paper as an advertising medium than this apparently simple request, and yet as an index of value it is practically valueless. Why? Well, think back and see how often you have neglected compliance with similar requests, and tell us why you neglected them. That will be an excellent reason. There is no obligation resting upon the reader to comply with such requests and as time, which to the busy man is money, may be saved by neglecting them, why, they go unnoticed. Business is like a river with many tributaries, and in which it is impossible to trace every individual drop of water to the spring from whence it came. But if a journal is selected for advertising purposes that reaches time and again the persons most likely to be interested in the solicitation, that paper is certainly a sure fountain-head of profitable trade in the stream of patronage far below. Temporary advertising in a small way will not produce an immediate or permanent increase of business any more than a slight shower will affect the depth of water in a well, but by persistency in the use of printer's ink in the right direction the results sought will be gained in the end with interest.

FREE ENTRY OF FOREIGN-SAWED LUMBER.

(Bangor Whig.)

Memorials setting forth that great frauds upon the revenue have been committed under the guise of the laws granting free entry of lumber manufactured in the British provinces by American citizens from logs cut in the State of Maine, have been numerously signed by the principal lumbermen of the Penobscot and Kennebec Rivers and forwarded to the Secretary of the Treasury through our members of Congress, with request that the department set in motion effective agencies for the prevention of the violations of law complained of. Representative Boutelle recently received a number of these memorials signed by the most prominent lumber manufacturers of Bango, Old Town, Orono, Milford and the vicinity representing the business on the Penobscot River, forwarded to him by Messrs. W. T. Pearson & Co., and on Tuesday he called personally on Secretary Fairchild with the papers and had an interview with him in regard to this important matter.

The secretary expressed a very earnest desire to do anything in the power of the department to remedy the evils represented, but stated some of the difficulties encountered, and the importance of having the co-operation of American lumber manufacturers with the revenue authorities in the matter of discovering and punishing fraudulent importation. The interview resulted in the following correspondence:—

TREASURY DEPARTMENT
FEBRUARY 15th, 1887.

Hon. C. A. Boutelle, U.S. House of Representatives, Washington, D.C.

SIR,—Referring to the petition of Messrs. Wm. T. Pearson & Co., Adams & Co., and others of Bangor, Maine, submitted by you to the Department, concerning alleged frauds in the importation of sawed lumber from New Brunswick, claimed to be the productions of the forests of the State of Maine, I transmit herewith a letter this day addressed to the said parties, which I will thank you, after perusal, to cause to be forwarded to the proper address.

Respectfully yours,
C. S. FAIRCHILD,
Acting Secretary.

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
WASHINGTON, D.C., Feb. 15th, 1887.

Messrs. Wm. T. Pearson & Co., Adams & Co., and others, Bangor, Maine:

GENTLEMEN,—The department is in receipt through the Hon. C. A. Boutelle, of your petition without date, concerning alleged frauds in the importation of sawed lumber from New Brunswick, which is claimed to be the production of logs cut in the State of Maine, and sawn in the Province of New Brunswick by American citizens, and to be entitled to free entry under the provisions of section 2,505 and 2,506 of the Revised Statutes, as contained in the Act of March 3rd, 1883.

The petition represents that great frauds exist in such importation in that a comparatively small amount of Maine timber is mingled with the great drives of the St. John River in New Brunswick, which are floated to the mills in that Province and there manufactured, and that the product, consisting principally of foreign lumber, is then imported into the United States, and admitted to free entry as of the productions of the State of Maine, manufactured in New Brunswick by American citizens.

The deparment is unable to take any definite action upon the general statement made in said petition. If you will, however, forward particulars concerning any transactions of which you have knowledge, specifying the names of importers, and importing vessels, dates of importations, and other data, the department will cause careful investigation to be made with a view to detect such frauds, and to prevent their recurrence in the future.

Respectfully yours,
C. S. FAIRCHILD,
Acting Secretary.

FOREST FIRES.

The annual report of the Ontario Commissioner of Crown Lands will be found to contain much that is of interest to our readers. It is very satisfactory to find that the wise measures taken by the Mowat Administration with the view of preventing or checking forest fires have been so successful in attaining the desired end. It has been repeatedly said that fire has done more than the axe to deplete our forests, and any mitigation ot this evil is therefore a most important consideration alike for the lumbermen, the public treasury and the country at large. From the departmental report it will be seen that fires last year were less frequent, less destructive and that when they occurred their speed was checked. This was largely due to the precautionary regulations that have been enacted and still more to the employment of officials whose special duty it is to see them enforced. How valuable has been the service rendered by these fire preventive officials is proved beyond cavil by the fact that the lumbermen have shown their appreciation in the very practical way of cheerfully bearing half the expense. In answer to a departmental circular the leading lumbermen have urged the continuence of the service, have expressed their willingness to continue to bear half the expense, and even advocate an extension of the system. Thus encouraged the Government has arranged to increase the number of these officials and to extend the area under their protective care. Even better results may therefore be expected in the future than those which have already proved so gratifying. It appears from the Commissioner's report that he has some natural hesitation to incur the expense of doing all that is asked or all that he thinks advisable. While economy is of course desirable and even necessary, parsimony in such a matter would be as economical as insufficient insurance of property exposed to risk of a conflagration.

The prevention or even the keeping within narrow bounds of these forest fires will save from destruction an enormous amount of property belonging not only to the lumbermen interested but also to the public treasury which has no less at stake. And besides the question of revenue, the whole community has an interest in the preservation of such valuable resources which form a large part of the national wealth.

Apart from the actual destruction of the forests by fire the mere dread of such devastation has an injurious effect. It often happens that limit owners hasten the cut of certain portions of their territory though it may be neither convenient nor expedient thus to hasten their operations, because they would rather submit to some loss and inconvenience than run the risk of the total destruction of property which for some reason they believe to be particulary exposed to danger. When a fire has run through the forest this urgency becomes an imperious necessity, for their cutting within a very limited period is absolutely necessary to prevent extensive deterioration and soon total loss, from the ravages of boring insects.

So too with the public treasury, there is not only the risk of loss by fire, but the very dread of that risk acts prejudicially. Thus Provincial authorities have sometimes placed limits on the market in excess of requirements, and when circumstances were not altogether propituous, for the avowed reason that it was better to do so even at some sacrifice than to lose all by fire, of which there was danger through advancing settlement, explorations for minerals, hunting and trapping, &c. Such forced sales are clearly not to the advantage of the Province, and are not always convenient for lumbermen, who may not care thus to add to their limits in advance of their requirements. With a reduction of the fire risk, these evils would be diminished.

In view of the mischief wrought by forest fires, the regulations for guarding against them should be maintained and even made more strict if necessary, they should be rigidly enforced, and an efficient staff should be employed not only to see them carried out, but also to prevent the spread of such fires as may occur.

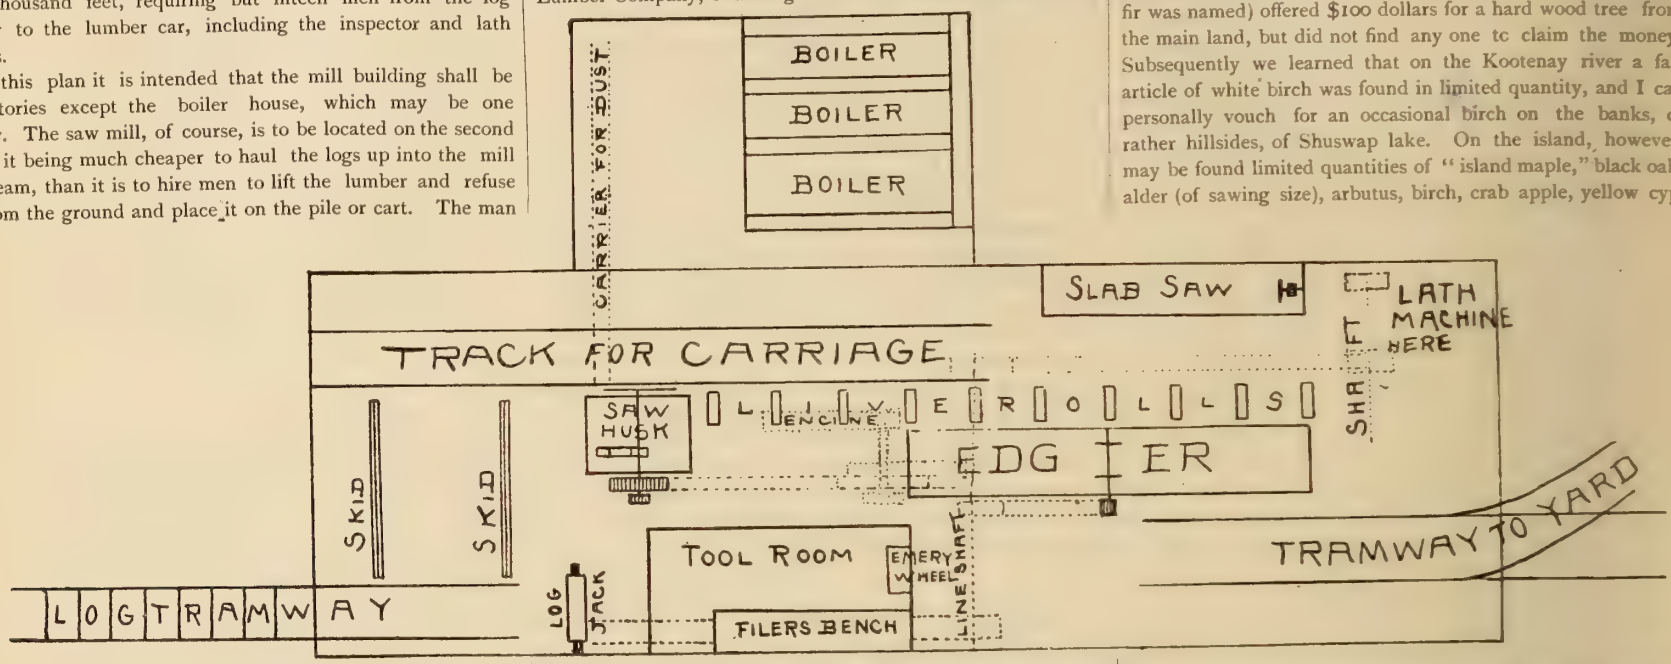
OUR New Brunswick correspondents have repeatedly complained of the injustice being done the trade of that province by the government allowing Americen lumbermen to make free use of their timber resources, and the question is certainly worthy of careful and immediate attention. The geographical position of the province of New Brunswick is such that unless the most stringent protective measures are adopted a continuation of forest destruction by Americans will not only be practiced as in the past but will be pushed with increased vigor. The principal support of the people of this province comes directly or indirectly from its extensive timber operations, and now that this revenue is being cut off, the people are led to enquire "What are we going to do?" Some positive move should be made, and that at once, to impress upon the Government the importance of restricting Americans from engaging in such a wholesale slaughter. If United States lumberman desire to operate in Canada, let them open out their mills on the Canadian side, and enter into fair competition with our own people. No one will object to this, as American enterprise and capital will always be found acceptable in this country, but when they cross the lines for the express purpose of cutting and carrying away our timber to be manufactured in their mills aeross the border, it is quite time we should call a halt. The export duty seems to be a dead letter in this province, aud no time should be lost in drawing the attention of the local members of parliament to the robbery now going on. The question is of too serious a nature to allow of delay.

SAW MILLS FOR PROFIT.

IN order to make a saw mill a success, or in other words a source of profit, it must not only be well managed, but must also be planned and arranged with a view to the handling of the stock from the pond or bank to the piling ground in the most expeditious manner and with the smallest practicable number of hands. The day is passed in which it was necessary to keep as many men in the mill as it cut thousand feet a day, and the man who tries to run a mill of that sort will soon get left.

We present herewith a plan for a saw mill of moderate cost to build and operate in proportion to the amount of its daily output. We have only shown in detail the usual and necessary machines, in order to bring the cost down to the minimum, but those who may desire something of greater capacity can readily add the usual appliances. The writer has seen a mill built after this plan with the addition of steam nigger, steam feed, and lumber trimmer,—the trimmer was placed between the edger and the tramway,—with a daily capacity of fifty thousand feet, requiring but fifteen men from the log jacker to the lumber car, including the inspector and lath hands.

In this plan it is intended that the mill building shall be two-stories except the boiler house, which may be one storey. The saw mill, of course, is to be located on the second floor, it being much cheaper to haul the logs up into the mill by steam, than it is to hire men to lift the lumber and refuse up from the ground and place it on the pile or cart. The man



who runs a ground floor mill of ten thousand feet daily capacity or over is doing an uphill business in more than one sense. The dotted lines are intended to show the location of the engine on the ground floor, also the shafting and belts suspended from the middle joist. The saw mill is intended to be driven by a belt direct from the pulley on engine shaft; another pulley is placed on the crank shaft which drives the line shaft, to which the edger and other machinery is belted. The slab saw should be a swing saw, and may be either suspended from above or supported from below. We prefer the latter, on account of the tendency which a suspended saw has to feed in too fast and choke up. The slab saw is driven by a quarter turn belt from the short shaft shown near the corner of the drawing. The two main belts should be provided with gravity tightener pulleys, so arranged that either one may be thrown off quickly from the sawing floor, in case of accident to the machinery, or for the purpos of examining or changing saws. In cases where it is desired to dress the lumber before shipment, the planer can be placed on the ground floor under the tramway, and driven by a belt from line shaft; but it will not be satisfactory to run the planing machine and saw mill at the same time, as unless the power is ample, the motion is too unsteady for the planer.

The dust carrier is an open box or trough, with a chain belt running through it. The bottom of the trough should be provided with slides for the purpose of discharging at any desired point in the boiler room. The carrier may be extended outside the boiler house, and the surplus dust carried out and deposited in the dump cart. A tramway should also be provided from the slab saw to some convenient dumping place at a safe distance from the mill. While the small mill man may not fell able to have a steam nigger, he should provide some better means for log turning than by the use of cant hooks. A geared windlass driven by a belt from some convenient point and provided with a strong rope and hook, will be found to answer for a small mill, and will save much time and hard lifting.—*Chicago Timberman.*

—Another saw mill is in course of erection in Calgary, N. W. T., with a cutting capacity of from 40,000 to 50,000 feet per day. This establishment is owned by Wisconsin men, who recently had extensive timber berths surveyed along the eastern slope of the foot hills. They are known as the Au Clair Lumber Co., under the management of Mr. Prince.

THE TIMBER OF THE PACIFIC.

A CORRESPONDENT, signing himself "G. W. H.," has been writing a series of articles to the *Northwestern Lumberman*, and as his last production has special reference to the timber of Western Canada, we reproduce the same. Our readers will readily perceive how cautious this writer is in his remarks, and how he inclines to write purely from an American point of view. Even though much that he says may be open to criticism, his version, right or wrong, will not be read without interest:—

From Winnipeg to the Rockies there is not a stick of timber to be seen which a lumberman would esteem worth cutting. From Winnipeg to the foot hills it would puzzle the wayfaring man to find a staff. South of Cassils are the Cypress hills, 25 miles distant, where is a timber tract estimated at 15,000,000 to 20,000,000 feet of jack pine, running 40 logs to the thousand. I did not visit it, nor yet the splendid mill erected for cutting it, but have my information from reliable sources. A few miles west of Calgary is the new mill of the Alberti Lumber Company, obtaining stock from a timber limit in the foot hills, by way of the Elbow river. This stock is not much different from that of the Cypress hills. From the summit of the Rockies to the coast, the Canadian Pacific runs through a densely wooded, mountainous country, and the novice would exclaim, "What worlds of timber!" but the lumberman would, with a more practical eye, discover nothing but "fence rails." An occasional exception must be noted as we pass the limited valleys of the Illecillewaet and Beaver, where, mixed with the predominant small "jack pine," may be seen a patch of larger size, even to trees of two and three feet; and at Donald we heard of a limit of a couple of thousand acres a few miles up the river, said to be "good timber." And in this neighborhood the company obtained 25,000,000 feet of mainly 12x12, with which to build the snow sheds. The flats along some portions of Eagle river looked as though there might be some fair-sized timber mixed through the saplings. Passing these we did not see a good-sized tree on the line of road until we neared Yale, 90 miles from the coast. The sides of the mountains are dense with tall forest growth, from 6 to 10 inchies in diameter; but if there was a world of good timber among it, the character of the steep mountain sides, and of the streams at their base, would forbid its utilization by the lumberman. At Yale (head of Navigation on Fraser river), however, we begin to see some timber and to observe stumps alongside the track, which would measure from 4 to 10 feet across. From all we could learn the whole of the interior, or mountainous portions of the province, is correctly judged by that portion traversed by the railroad.

There is an occasional lake, in fact many of them, in the mountains, hemmed in by cliffs whose precipitous sides extend from thousands of feet above to hundreds if not thousands of feet below the surface of the water, but it is difficult to find any shores, and the timber growth on the hillsides is of the small stuff before mentioned. Some of these lakes are fed by rivers, and where the river empties into the lake an area of a few thousand acres of good timber can be found. We visited one such river, and found a valley of from two to five miles in width, densely wooded with the red cedar of the Pacific, trees from two feet to 10 and 12 in diameter, with trunks 150 to 200 feet to the first limbs. We counted the trees on one acre, and figuring out the contents of an average tree, we estimated 597,000 feet to the acre. We could hear of but one other such tract in the province. There is, however, a tract of excellent white pine *(Pinus monticola)*, about 55,000 acres in extent, said to average 100,000 feet to the acre, in the region of Mable lake, which with a drive of 138 miles down the Spullmcheen river could reach the railroad. It is needless to say that these tracts have been taken up. Aside from those mentioned we could learn of no timber in the interior which could be made available by lumbermen. When we reached the coast, however, we must tell a different tale. As near as we could learn, the available timber resources of British Columbia are confined to a belt on the main land not more than 50 miles in width at the outside (in many cases but two or three miles), and this so broken by mountain ranges as to greatly reduce the timber area. The island of Vancouver, however, is a vast forest of timber of most excellent quality. The island is about 300 miles long, averaging 100 miles in width; its shores are broken by bays and inlets, often running many miles inland, and it would be difficult to find one of them which did not offer a fine quality of fir to the seeker. Smaller islands abound, all of which are well timbered. On the main land I inquired in vain for any variety of hardwood, and was told that the first governor of the province (the honored Douglas, after whom the fir was named) offered $100 dollars for a hard wood tree from the main land, but did not find any one tc claim the money Subsequently we learned that on the Kootenay river a fair article of white birch was found in limited quantity, and I can personally vouch for an occasional birch on the banks, or rather hillsides, of Shuswap lake. On the island, however, may be found limited quantities of "island maple," black oak, alder (of sawing size), arbutus, birch, crab apple, yellow cypress, fir, hemlock, white pine (very little), spruce, white thorn and yew. Of these the Douglas fir predominates, with a mixture of 10 to 15 per cent. of red cedar, an occasional white pine *(pinus monticola)*, and spruce. The fir grows to immense size, and, so far as I can could judge, was esteemed fit for the saw mill only when from four feet diameter upward.

We endeavored to obtain estimates from those we esteemed most competent to judge as to the aggregate timber resources of the province, but out of half a dozen timber rangers, mill men and government officials, the highest estimate given was "7,000,000,000 to 10,000,000,000." From a knowledge of earlier customs in the east, and a conviction that when the four foot timber became scarce smaller growths would be in request, we placed an estimate of from 40,000,000,000 to 50,000,000,000 feet as nearer the correct figure.

The fir has a height of from 150 to 250 feet, its leaf more nearly resembles the hemlock than the pine, and its wood is akin to the fat pine of the south. It is said to be no infrequent occurrence for the saw to strike into a "pocket" of liquid pitch from which one or two gallons may be strewn promiscuously over the mill. The butt logs are very similar to long leaf or Georgia pine, while we saw top logs which appeared more like white pine than like the "loblolly" of the interior of the southern states. An end section of fir laying upon your desk would be pronounced "southern pine" by a majority of your visitors, if they did not examine the face before giving their opinion. It is a pecularity of this timber that it may be used green from the saw (in that climate) without danger of either shrinking or swelling. It would probably need acclimating by means of kiln drying in other climates. I was told by a carpenter whom I saw working in it that when bone dry it was frequently necessary to bore for the nail, and that when once driven, the nail could not be withdrawn without breaking. These pecularities no doubt account for the fact that in every mill we visited we found a pony planer at the rear of the mill through which the lumber was passed as it left the saw. A piece a foot long, one inch square, supported at the ends, will show a breaking load of from 650 pounds at the highest, to 600 pounds at the lowest, or a mean of 638 pounds as shown by government tables. Its mean crushing load is 7,000 pounds to the square inch endwise, and 1,750 pounds sidewise. Its weight dry is 3¾ pounds to the foot. It is a timber which will fill any place where strength is required, being stronger in every respect than oak or maple. It is largely used also for

finishing purposes, although its pitch prevents it from becoming a favorite.

The red cedar is the finishing wood of the coast, taking the place which in the east is monopolized by white pine. It is not the pencil cedar of Tennessee or Florida, nor the red cedar with which we are familar. It is of more open grain ; in fact its grain is no more dense than the white cedar of Michigan. It is however a beautiful wood, and finished *au natural* is no whit inferior in appearance to cherry, and in many instances equal to mahogany. It is almost exclusively employed in the manufacture of doors, sash, blinds and mouldings, while for ceiling and wainscotting it is unequalled. It takes paint like pine, but is so much more beautiful in natural finish, that it is seldom defaced with paint. It is often used in connection with the redwood of California, and like it sells at about $35 to $40 a thousand. It is somewhat gritty in working and in this respect resembles redwood, but of the two was most commended by carpenters. Like the fir it may be used direct from the saw without danger from warping or twisting. Several of the finest buildings at Victoria, notably the Victoria theater and Driard hotel, are finished in cedar, and no one could ask a richer *tout ensemble*. It is not plentiful even at Victoria, and the coast cedar does not equal in quality that of the mountains.

While upon the subject of cedar, we must not forget to mention the beautiful yellow cedar, or cypress, of the northern part of Vancouver island, and I have never heard of it elsewhere. It is of a beautiful creamy color, very dense in texture, taking a high polish and with a specific gravity of 31.21 as compared with fir at 34, red cedar, 24.95, maple, 37.41, white pine 27.79. For strength it will carry a mean breaking load of 693 as compared with fir at 638, maple, 580; oak 550. It crushes endwise at 5,900 as compared with red cedar at 5,500, fir at 7,000, oak, 6,500, white pine, 5,500, and sidewise at 1,400, as compared with red cedar at 1,500, fir, 1,750, hemlock, 1,000, maple, 1,500, and white pine, 1,000. As an ornamental panel with red cedar, mahogany or cherry, it shows a rich contrast, and is altogether a most desirable wood. I could hear of but limited quantities, in patches of 160 acres or so, but its value may be assumed from the readiness with which it finds market at $60 per thousand on the coast.

OTTAWA LETTER.

From Our Own Correspondent.

OTTAWA, March 24th, 1887.

The leading industry of the Ottawa Valley and the one with the most capital embarked, is undoubtedly the taking out and manufacture of lumber. Perhaps it may be a fact unknown, but it is a fact nevertheless, that sixty millions of dollars are invested in the lumber business of the Ottawa Valley, and this is almost, if not equal, to the whole of the capital invested in manufacturing in the Dominion. The principal assets of the firms engaged in lumbering are timber limits, saw mills, improvements on rivers and creeks, to facilitate driving stocks of lumber on hand, piling grounds and machinery. The area of timber limits under license on the Ottawa and its tributaries in the Province of Quebec is 9,732 square miles, and in Ontario 7,153 square miles. In 1886 there were logs cut to the enormous quantity of 496,000,000 feet board measure, the getting out of which furnished employment to thousands of men and teams in the woods, at the mills and on the river. In addition to the saw logs about twenty millions of dimension timber were taken out last year.

WHO ARE OPERATING.

The greater portion of the vast era of limits in the two Provinces mentioned above is worked by firms whose headquarters are at Ottawa. The following operate in the Province of Quebec : Gilmour & Co., Hamilton Bros. J. R. Booth, James McLaren, Ross & Co., Bronson & Grier, Alex. Fraser, Bronson & Weston, J. &. G. Bryson, Gillies Bros., Perley & Pattee, E. B. Eddy, Hurdman & Co., W. C. Edwards, Bronson, Weston & Edwards, David Moore, McLaughlin Bros., Latour Estate, John Ross, Bryson & Charlton, Thomas Glover, Thompson & McKay, R. White, Peter McLaren, Martineau Estate, Rochester & Doherty, McLaren & Edwards, James Cotton, D. Murphy, J. B. Dickson, John Roche, H. U. Noel, John Smith, Estate Sir F. Hincks, Estate A. Grant, R. White.

The names of the principal limit holders in the Province of Ontario are :—

J. R. Booth, Perley & Pattee, Bronson & Weston, McLaughlin Bros., Bronson, Weston and Grier & Co., Gillies and McLaren, Barnet & Mackay, E. B. Eddy, Wm. McKay, McClyment & Co., James McLaren, Alex. Fraser, Thistle, Carswell & Co., Boyd, Caldwell & Son, R. Klock, Hurdman & Co., R. Ryan, N. E. Cormier, Gillies Bros., O. Latour, A. & P. White, A. Barnet, H. M. McLean, Emery Bros., A. S. McLean, Ontario Lumber Co. and McCarthy & Co. There are about 18 firms engaged in the manufacture of square lumber in the Ottawa and Nipissing district. This branch of the trade however is decreasing in operations year by year and this year will not go more than 5,000,000.

SAWN LUMBER

cut at the mills in Ottawa is shipped principally to the United States and to other points in Canada. Last year, however, quite a quantity was shipped to England and found a ready market. Nothing, however, was shipped to the latter point but first class stuff. The manner of shipping to the United States is chiefly by barges which are towed down the Ottawa and St. Lawrence and through the canals to Sorel, thence up the Richelieu River and Lake Champlain to Whitehall and down the Hudson to Albany and New York. Considerable quantities of lumber are also shipped by the Rideau Canal and Canadian Pacific and Canada Atlantic Railways, and lately some heavy shipments have been made by the Canadian Pacific Railway of square lumber from the district of Nipissing. The entire output of sawn lumber from the Ottawa district in 1886 was between 700,000,000 and 800,000,000, but this year that quantity will be lessened owing to the difficulty with the log drawing, the unprecedented snowfall curtailing and in many cases preventing the drawing.

TOTAL VALUE.

The total value of sawn and manufactured lumber exported from this district to the United States was : In 1884, $2,843,575 ; 1885, $2,254,801 ; 1886, $2,170,814. It is estimated that there will be a considerable falling away in the latter figures in 1887.

OTTAWA MILLS.

The immense water power furnished by the Chaudieur and Rideau Falls runs a great number of lumber mills, many of which, at the present moment of writing, are being fitted up for the summer's operations. The Messrs. Grier have during the course of the winter erected a new mill which it is expected will be ready to begin operations about June 1st. The sawmills in this district are of large capacity and are equipped with all modern appliances for rapid, smooth and economical work. These are all "gangs" and contain from four to eight gangs of from thirty-six to forty-two saws each with all the necessary edging tables, all lumber being made parallel and passed over chain butting tables. The lumber manufacturers of Ottawa are fully alive to the necessity of keeping abreast of the times and the necessity of the industry. The mills are run night and day for between six and seven months of the year or from the time the river opens till the Canadian Sovereign, Jack Frost, stretches his scyptre over the waters. The mills in general are lighted by electricity which aids materially in night work. About two-thirds of the sawn lumber of this district is produced at the Chaudiere and Rideau Falls mills. Eleven hours a day constitute a days work for mill hands and others connected with the manufacture and handling of lumber, and wages are paid weekly to mill hands. The number of men who find employment in connection with the lumbering business in the Ottawa district is very large and variously estimated at from ten to 12 thousand. There is no fixed rates for workmen but the following gives an approximate idea : Foremen $50 per month, choppers $24, road cutters $17, teamsters $20, cooks $35, log measurers $35, head sawyer for gangs $40 to $50, for circulars $40 to $60, tail sawyers $30 to $35, edgers and trimmers $35 to $40, filers $40 to $50, ordinary laborers $1.25 per day.

TIMBER DUES.

The timber dues in the Province of Quebec are, generally speaking, higher than in Ontario. For oak and walnut the dues are four cents per cubic foot in Quebec and three cents in Ontario, red pine, white pine, cedar and other square timber two cents in Quebec and 1¼ cents in Ontario, fine logs 13½ feet long, 17 inches diameter, 22 cents each in Quebec, 15 cents each in Ontario. Less than 17 inches 11 cents in Quebec 15 cents in Ontario. Spruce logs 5½ cents in Quebec, 10 cts. in Ontario. White and Norway pine saw-logs per 1,000 board measure $2.00, hemlock logs same measurement $1.00.

SLIDES AND BOOMS.

In connection with the immense timber and lumber traffic of the Ottawa Valley an extensive system of slides and booms has been constructed on the Ottawa and its tributaries. The total length of the Ottawa River is about 700 miles. The upper portion of the river descends from the north-west to Lake Temiscaminque and then turns to the southeast, which general direction it follows to its confluence with the St. Lawrence at Montreal. The most important tributaries of the Ottawa are the Gatineau, Mississippi, North Nation, South Nation, Lievre, Rideau, Madawaska, Bonchere, Coulonge, Black River, Petewawa, Chalk, Mattawa, Dumoine and Magnasippi. On all these streams extensive timber limits are worked by Ottawa capitalists and improvements have been made by public and private enterprise to facilitate the passage of square timber and logs. The first public slides and booms constructed on the Ottawa were begun in 1841, but private enterprise had constructed slides at the Chaudiere, Portage du Fort, Calumet and at Arnprior prior to that date. Philomon Wright, an American pioneer who settled at the Chaudiere shortly after the war of 1812, built a slide on the Hull side which was purchased by the Canadian Government in 1849 for $40,000. In 1843 Mr. David Moore built a slide at Calumet. The first important slide on the Ottawa is that at Carillon, 68 miles below Ottawa. The total amount expended by the Government of Canada in erecting slides and booms on the Ottawa river was $339,204. For repairs, staff and operation $275,113 were expended between the years 1867 and 1882. The total receipts for slides and booms on the Ottawa and its tributaries for 1886 was $107,328. In 1886 269,504 pieces of square timber and 3,550,698 logs passed through the Ottawa slides.

THE TRADE FOR 1887.

The trade for 1887 promises to be brisk but the heavy snow fall will materially lessen the log cut. In conversation with the different lumbermen of the Chaudiere they expressed themselves like this :

MR. J. R. BOOTH

said that the difficulty experienced this winter by the lumbering firms in the Ottawa district in getting out the logs will have the effect of lessening the cut by from 20 to 25 per cent. This reduction will affect the amount of lumber sawn during the coming summer and unless the mills have a large reserve of logs from last season the mills can hardly run their usual full time. In cases where lumbermen sell their whole season's cut before they begin to saw this state of affairs may prevent those who do so from keeping their contracts, but most of the large firms only sell a portion of their season's cut before hand. To all appearances, he added, the floods of this season would equal the memorable ones of seven years ago if the snow and ice went with a rush. Floods, as far as the lumbermen were concerned, would make a splendid drive but might also do damage by preventing mills from running owing to raising the back water on the Ottawa.

MR. E. B. EDDY

said the depth of snow in the bush was unprecedented in the history of lumbering in Canada and would have the effect of lessening materially the season's cut. The amount of sawn lumber turned out from the mills this coming summer would, he thought, be much smaller than last year.

MESSRS. PERLEY AND PATTEE S, MANAGER

said the cut at the mills this year would be much less than last year. He thought injury would be done to the mill business by the hight water which seemed to be inevitable.

MR. BRONSON

of Bronson & Weston, said the state of affairs in the shanties was most unsatisfactory. The number of logs cut this season would be much lessened from last year's returns. His own firm, he said, would have sufficient logs to keep them running all summer. He anticipated bad flooding.

MESSRS. GILMOUR & CO.

who are carrying on an extensive operation on the Gatineau river, state that the depth of snow would lessen the log cut from 15 to 20 per cent. but much depended on how the season would wind up.

MR. HIRAM ROBINSON

of the firm of Hamilton Bros. considered that the cut would be materially reduced owing to the depth of the snow. The probable reduction will be 15 to 20 per cent.

MR. J. HENDERSON.

of the firm of James McLaren & Co., said there was a likelihood that the reduction would be 25 per cent. The markets are steady at present but he thought it likely judging from the dimunition in the cut that prices would go up considerably.

G. B. GRIER & CO'S. MANAGER

thought that the firms would be able to keep their contracts with buyers, but owing to the reduction in the log cut there would be no reserve logs for next fall. He feared bad floods.

Other lumbermen seen on the subject coincided in the view that fewer logs would be cut this season than last, but all agreed that prices would feel more or less of a boom. The date for opening the mills is fixed all the way from April 20th to May 1st, but all depends on the season, and whether or not operations will be carried on between the 20th of May and the 20th of June, depends on the rise in the waters of the Ottawa. From careful competition 600,000,000 feet will cover the output of the entire Ottawa district for the year 1887.

LUMBERING.

MCARTHUR BROS., of Toronto, are cutting a quantity of very nice pine timber, only eight miles from the city of Toronto. It is timber that has been saved apparently for this special occasion. This firm is also putting in a quantity of logs and board pine in upper Michigan and in the Georgian bay district. It owns large tracts of timber, and has made a large sum of money in knowing how to do business in a strictly orthodox style. The firm maintains an office in Saginaw as well as at Toronto, and in the palmy day of oak timber in the Saginaw country it was among the largest shippers.

NOTES FROM THE MILLS.

ONTARIO.

—A sash and door factory is likely to be built at Portage du Fort this spring.

—Loggers are hopeful that wages for the spring drive will be high this spring.

—Work is to be commenced on Tait & Wylie's saw mill at Midland at once.

—Mr. Mat. Sierra, of Norwood, while skidding logs a few days ago, had his leg broken.

—Messrs. Swackhammer and Butler, of Acton, have purchased the Ballinafad saw mill.

—Mr. Bechler is erecting a new mill on the 6th concession of Greenock township, Bruce county.

—William Mitchell, of Deseronto, is making some extensive improvements in what is known as the Big Mill.

—Mr. C. J. Rykert, of timber limit fame, is spoken of as the probable Speaker in the new Parliament at Ottawa.

—The Minneapolis & Ontario Lumber Company has purchased 1,500,000,000 feet of timber in British Columbia.

—Mr. J. B. Coates, of Picton, lately purchased Andrew Irwin' saw mill at Blenheim, and has taken up his residence there.

—A. Hirtle, the proprietor of a planing mill in Berlin, has effected a compromise at 50 per cent. secured, on liabilities of $3,000.

—A large crotched tree was recently felled in one of Boyd & Co's shanties in Monmouth which measured 5 ft. 4 in. at the butt.

—Loggers from all parts of the country are rapidly returning from the shanties and the work in the woods is practically at an end.

—Mr. J. Watson of Cæsarea, has put up a large addition to his shingle mill, and is putting in a lath machine and other machinery.

—Messrs. Bronson & Weston are making numerous improvements in their mills at the Chaudiere in preparation for the coming season.

—At Little Current, Manitoulin Island, Ont., railway ties and logs are coming out of the woods rapidly, and business of all kinds is good as a consequence.

—Mr. Bowerman of Brooklyn has purchased the saw mill on Sawyer's Lake. He will be prepared to cut on the 1st April, and talks of putting up a woollen mill.

—Jas. Keenan, of Huntley township, while drawing logs recently, the binding pole slipped and knocked him off the load. He fell under the sleigh and was crushed to death.

—Messrs. Grier & Co., have placed a complete plant of machinery in their new mill at Ottawa, and will soon commence cutting. The new mill is built after the style of E. B. Eddy's.

—The Midland *Free Press* says there will be a big boom in lumbering in that region this summer. The Ontario Lumber Company have closed with Messrs. Ross and Devonport's tender for the building of their new mill.

—Mr. J. R. Booth has a gang of 50 men engaged in making repairs to his saw mills at the Chaudiere, in anticipation of the coming season. Mr. Booth expects to be able to commence sawing as soon as the river is clear of ice.

—John Shaw, of Forest, and Simon Fraser, of Amherstburg, have closed with the Georgian Bay Consolidated Lumber Co. for the entire cut of their Eyng Inlet lumber mills, amounting to 12,000,000 feet of lumber and 4,000,000 pieces of lath.

—More than 400 American and 130 Canadian barges are employed in the Ottawa river and Lake Champlain lumber trade. This immense fleet would be thrown into ordinary if the President should enforce the retaliatory law lately passed by congress.

—The amount of snow in the Parry Sound district the past winter has been deeper than for years past, and as a result logging operations has been difficult. Notwithstanding this, however, it is said that the cut of logs will be one of the largest for years.

—The last season's cut of lumber in the White Lake district is being shipped now. Twenty-eight teams are engaged in drawing to Pakenham, eight of which are drawing for J. R. & J. Gillies. About 2,000 feet constitute a load, and one trip a day is made.

—A correspondent at Kingston writes that there is not much lumber on the Kingston & Pembroke railway unpurchased. Operators worked at railway ties as a rule. Limit holders get out their usual supply this winter. Most of the ties are purchased by the Rathbun Co. Hemlock is becoming very scarce in this vicinity.

—Messrs. Grier & Co., of Ottawa, intend making a roadway under Broad street for transferring the lumber cut in the mill to the sorting ground. This change will be a great improvement, as by the transfer of lumber in the ordinary way the streets would run a risk of being blocked up.

—An immense moose having been seen by several men belonging to the lumber shanties on the Schyan River, near Pembroke, Messrs. G. B. Moore, J. A. Angus and J. F. Inglee started in pursuit. Getting on the trail they soon sighted the object of the chase, a truly noble animal, and killed him after some trouble. The dressed carcass weighed 900 pounds and the skin 113. The animal is said to have been the largest ever seen in the district.

—From Ottawa reports it is surmised there will be a full cut at least, and if the winter had been a good one for lumbering, many more logs than the mills could have cut up, which is limited, would have been made. This is accounted for by many square timber men having taken contracts for sawn logs instead of cutting square timber. If anything will be short next season it will be square timber, which is being cut in very small quantities compared with former years.

—Mr. George A. Loud, of the Oscoda Salt and Lumber Company, Mich., has returned from the Georgian Bay district, where he is banking several million feet of long timber and short logs for the American market. When the south extension of the Algoma branch of the Canadian Pacific is completed next summer it will be quite easy for Michigan lumbermen to reach the pine forests of the Serpent, Spanish and French rivers, going *via* Mackinaw and the Sault in place of *via* Toronto.

—Mr. J. C. Robert, lumber merchant of Montreal, was in Ottawa a few day's ago, endeavoring to obtain a supply of lumber, but is reported to have announced his ill-success as follows:—"Nearly every plank in the Ottawa market has been purchased. I visited five firms here to-day, and at each place was told that the entire cut has been disposed of. In one or two instances I was offered a few thousand feet by way of accommodation. The manufacturers certainly can't complain as the last ten or twelve months has witnessed an advance in prices of about 15 per cent. Dealers won't figure upon next season's cut."

—Repairs have been going on nearly all winter at the various booms, slides and piers along the Ottawa River. At Des Joachims, about fifty miles above Pembroke, the slide and booms are being repaired, at Mountain Station, near Portage du Fort, a gang of men are re-constructing the side piers on the dock, which were damaged at the breaking up of the ice last spring. The ordinary winter repairs are going on at the Chaudiere and Hull stations, while on the tributaries such as the Dumoine, Pettewawa, Black River, Coulonge, Madawaska, and Gatineau repairs are going on in preparation for the opening of navigation, and also the anticipated ice shoves in the spring. The largest operation is on the Coulonge, the damage being effected last year by the heavy masses of ice coming in contact with the booms and completely demoralizing them. The Ottawa River works have taken precaution this year and will be in readiness for the break-up. It is said that if the ice breaks up in the solid masses, as last year, there will be no saving the wharfs, booms, boats and other works, notwithstanding their extra fastenings.

QUEBEC.

—The roads are blockaded by snow in every direction.

—Owing to the heavy snow lumbering operations in the district of Quebec are being abandoned in every direction.

—A fairy supply of pine logs has been cut in Quebec, and if they can all be driven to the mills there will be no stoppage.

—Business is very dull in the lumber business. No sales are being made in the American market, and Quebec merchants are holding off.

—Messrs. Dobell, Beckett & Co. are credited with the purchase of Stokes and Kelley's elm, about 60,000 feet at 28c. This lot is stated to be two years old, and 45 to 50 feet average.

—The British Admiralty has awarded contracts for pine and spruce deals to Messrs. Smith, Wade & Co., and for Canada pipe staves to Messrs. R. R. Dobell & Co., both Quebec firms.

—A correspondent from Montreal says that the arrivals from the lumbering district around Three Rivers report an immense quantity of snow in the woods. There is fifteen feet in some places. There is certain to be a great dearth of logs in the spring, and the lumber trade will sustain great loss.

—Preparations are being made in the Hull lumber yards for the opening of the season. As soon as ever the ice sufficiently breaks up great activity may be anticipated in this department as the supply of logs at the boom is sufficient to keep the mills going six weeks without any additional supplies from the shanties.

—Messrs. Fuller & Hill, of Bolton Center, Que., are turning out all the butter tubs it is possible for them to make. They have an order from Scotland for two car-loads of tubs per week. A car contains from 1,800 to 2,000 tubs.

—An American firm who possess a patent for manufacturing a fireproof composition out of sawdust and clay are considering the advisability of opening a branch establishment at Hull. The immense quantities of sawdust which can be obtained at an almost nominal price greatly favors such an enterprise, and its establishment will be a decided boon to Hull. If this scheme be carried out it will certainly develop a new industry in the Ottawa Valley and one which would employ a large number of hands, and furnish a considerable export trade to this district. If water power should be required Ottawa instead of Hull may be selected.

NEW BRUNSWICK.

—A man named Joseph Miller, employed in a factory at St. John, N.B., recently had his arm split by a circular saw from wrist to elbow.

—St. John, N. B., exported $22,048 worth of timber, lumber, lath, shingles, etc., during the month of February, against $36,596 during the same time last year.

—A large quantity of pulp wood concentrated at Moncton, New Brunswick, for shipment to the United States. Several vessel loads will be thus shipped, it is said.

—Messrs. Simson & Mason, Limited, have just been appointed sole agents in France, Spain, Portugal, and Algeria for the New Brunswick Trading Company of London, Limited. The New Brunswick Company handle the entire well-known stocks of Messrs. R. & J. Stewart and Messrs. Guy & Co., who ship spruce from St. John, Miramichi, Bathurst and Shediac, besides pitch pine from Mobile and Pensacola. These classes of wood goods are being sold more and more each succeeding year on the continent.

—Wm. H. Murray, Isaac H. Page, John Kilburn, Franklin Stetson, Walter S. Stevens, George B. Dunn, Whitfield Giberson, J. Fraser Richardson, Edward L. Jewett, David Keswick, Jarvis Hayward, Chas. F. Woodman, Darius Vixon, Wm. H. Cunliffe, Archibald F. Randolph, Geo. T. Baird, John S. Leighton, Adam J. Beveridge, Israel Merritt, James Yerxa, Cornelius Hagerman, Matthias Nadeau, Bedford Hume, Frederick Moore, Thomas H. Phair, and Wm. F. Fowler have petitioned the Main legislature to be incorporated into "The St. John Log Driving Company."

—Messrs. Weldon, McLean & Devlin, solicitors for the People's Bank of New Brunswick, have obtained an injunction from Judge Palmer, prohibiting the New Brunswick Trading Company of London from conveying to any person the real estate lands and premises described in certain deeds from one John Stewart to them executed upon the 8th inst., and recorded on the 9th in the county of Gloucester; also prohibiting the same company from disposing or removing any of the property described in a certain bill of sale dated Aug. 7, 1884, from Robert and John Steward to the People's Bank, and registered March 10, 1887.

—The St. John River Log-Driving Company held its annual meeting in Fredericton on the 13th ult., when directors were appointed in the persons of Frank Stetson, president; Robert Conners, F. W. Giberson, Wm. Tidlie, and Darius Nixon. The secretary-treasurer is J. Fraser Gregory. For driving purposes the river is divided into seven districts; 1st, from Grand Falls to boom limits; 2nd, Salmon Falls to boom limits; 3rd, Aroostook Falls to boom limits: 4th, Tobique to boom limits; 5th, Big Presque Isle to boom limits; 6th, Becaquimic to boom limits; 7th, Maduxinkeag to boom limits. The driving was sold at the following rates; district No. 1, 18c. per thousand; No. 2, 11c.; No. 3, 15c.; No. 4, 14c.; Nos. 5, 6, and 7, 9c. per thousand.

MANITOBA AND THE NORTH-WEST.

Alex. McIsaacs was brought in from Cameron & Kennedy's camp at Rat Portage a few days ago having his back broken by a tree falling upon him. The whole lower part of his body is completely paralyzed. Very little hope is entertained.

—On account of the recent increase of freight rates from the Mountains to Calgary, all the lumber merchants have cancelled the orders they had placed with the Mill-owners in the west, and have appealed to General Manager Whyte for a reduction in the tariff.

—Thirty-eight thousand shingles were cut, edged and packed recently in a day of ten hours at McFadden's mill, Minnedosa, by the Orr boys. It is stated that if it had been a favorable day the cut would have reached forty-five thousand. The men at the mill claim this to be the best day's cutting ever done in Manitoba, and want to know who can beat it.

BRITISH COLUMBIA.

—Victorio, B. C., has three saw mills which have an annual capacity of 40,000,000 feet. There are numerous small saw mills in operation near the city, and all doing well.

CHIPS FROM YANKEELAND.

The railroads are hustling the logs to the Saginaw river at a lively rate.

The Detroit and Bay City railroad will have hauled at the close of the present season 230,000,000 feet of logs.

The project for a winter bridge across Detroit river has taken definite form. The first stages of the work has been begun.

Hamilton, Mass., is to have a planing and saw mill run by power furnished by a wind mill. It is believed that this is a new application of such power.

A Buffalo, N.Y., paper says that the lumber trade of that city and Tonawanda leaves more money in local hands in the two places than the grain trade, large as that is.

Careful estimates of the log crop of the streams tributary to booms, will furnish logs to Bay City and the Saginaws, the present winter, place the amount at nearly 600,000,000 feet.

In Michigan the value of lumber, per 1,000 feet, has only increased from $12 in 1866, to $13 in 1886, while stumpage has jumped from $1.25 to $5.50 per 1,000 feet during the same period.

Baird & Robins, of Big Rapids, Mich., are about to erect a large steam saw mill at Rhinelander, Wis. The *Herald* says the mill will have a capacity of from 80,000 to 100,000 feet per day.

The question of inspection and straight measure still continue to agitate lumber circles, and their seems to be a rather decided front in opposition to the plan of selling by straight measure.

The proposed building of the Alpena & Petoskey railway, in northern Michigan, is likely to promote other enterprises with the object of opening out the timber resources of the northern counties.

The *Lumberman's Gazette* claims that "the dark, sand-burdened Saginaw river still continues to float out more lumber than any other stream in the world that we know of; Muskegon comes next."

The logging business is being pushed for all it is worth in Alpena county, as well as in other parts of the state; and the outlook at present is favorable for the full realization of the anticipated log crop.

New York hardwood men are agitating the subject of uniform inspection throughout the country, or at least the adoption by the various exchanges at principal points, of a system which shall be common to all the leading markets.

Down in Maine the law makers have become exercised over the waste of forest wealth going on in that state, and the result is a bill now pending before the legislature providing for the appointment of a commission to look the matter up.

Lumbermen in New York are taking considerable interest in the proposed national inspection system for hardwood lumber, and it is not unlikely that a call will shortly emanate from their new exchange for a convention at some central point to consider the matter.

The American Forestry Congress has addressed a memorial to the Congress of the United States on the necessity of preserving from depredation and fire the forests that now exist on the Government domain, and on the desirability of encouraging tree-planting on the great plains.

It is evident that the mill capacity of the northwest, especially that of Wisconsin and the upper peninsula of Michigan, will be greatly increased during the current year. In both the sections indicated there is to be a wonderful development of resources by reason of the building of railroads and the opening of mines. As these regions are largely timbered with pine, mills will be erected simultaneously with the building of railroads.

Flatt, Bradley & Co., of East Saginaw, Mich., have a contract to supply the British Navy with masts. They are at present getting out spars on the Pinconning branch of the Michigan Central railroad, and lately shipped a quantity to Nova Scotia, a new departure in the method of forwarding masts to the seaboard, as hitherto they have gone down the lakes by water. There must be some urgency in British naval affairs, since the builders cannot wait till the opening of navigation.

The exports of lumber from New York have been much larger so far in 1887 than in 1886. The shipments of pine in January amounted to 5,905,000 feet, as compared with 5,181,000 feet in January, 1886. About three-sevenths of this year's exports went to South America, and one-third to the West Indies. A successful effort to establish rail shipments is in progress in the Saginaw Valley. In 1880 that district sent out 27,000,000 feet of lumber by rail, and 770,000,000 feet by water. Last year the rail movement amounted to 176,000,000 feet, and that by water to only 591,000,000 feet. The principal gain in the former direction has occurred since 1884.

The Minor Lumber Co., Alpena, Mich., is said to have recovered $9,200 of the $11,000 appropriated by the defaulting salesman, W. J. Miller. The latter is now in Canada.

An Associated Press dispatch from Chicago says: The grand total of the white pine lumber product of the Northwest for 1886 was 7,426,368,000 feet. This is 870,000,000 feet in excess of the preceding year, and is only slightly short of the total cut for the year 1882, 1883 and 1884. The greatest gains were in the older milling districts. The grand total of the shingle product of the Northwest was 4,575,531,000 shingles, which is the largest showing in any preceding year. These figures are cited as showing that the maximum annual lumber product of the white pine districts has probably not yet been reached. The stock of lumber on hand at the mills at the close of the year is placed at 3,068,093,000 feet, or 170,000,000 less than at the close of 1885, and 450,000,000 feet less than in 1884. The stock of shingles were 350,000,000 more than in 1885, and 10,000,000 less than in 1884.

Every indication at present points unmistakeably to the belief heretofore expressed by this paper that unless some entirely unexpected event happens, the lumber business will open encouragingly, and continue prosperous during 1887. Our opinion is seconded in this wise by *Lumber*, one of our exchanges: "The trade outlook is very favorable at present although the actual business is not quite so heavy as at this time last year on account of bad weather. The arrangements for building this season are quite as extensive as at this time last year, possibly more. Quite a number of solid business men are contemplating extensive building operations the coming season. If the general business of the country is not interfered with by legislation or other outside causes, everything points to an extremely brisk season. Lumber seems to be holding firm in all markets with a slight prospect of an advance in some articles, particularly hemlock and yellow pine."—*Lumberman's Gazette.*

EUROPEAN LUMBER NOTES.

The English lumber market is gradually improving.

The stock of lumber in the Liverpool market is very much reduced.

It is generally apprehended that timber freights will be advanced in England shortly.

A correspondent writing to the *Timber Trades Journal*, wants to know why it is that the ends of Quebec Birch are Painted red.

Two cargoes of lumber shipped by Messrs. D. & J. Maguire & Co., insolvents of Quebec, to the English market, were seized at a London port recently.

Considerable discussion is at present going on among the members of the trade regarding the advisability of establishing a Lumber Exchange in England.

Liverpool trade is still in a stagnant condition, with very few orders in the market, and no disposition to enter in arrival business, in which, so far, there has been very little done, especially in Quebec goods. The failure of Messrs. R. A. & J. Stewart has naturally given rise to considerable comment.

Rumours having been circulated as to the New Brunswick Trading Company, Limited, being affected by the reported difficulties at St. John, N.B., we made direct enquiries, says *Timber*, and were assured by one of the directors "that even had the rumours been true there would have been no loss to the Company, who are quite prepared to meet their engagements."

The prevailing impression in England is that very little is doing in business for the new season for the Baltic, but it is said that considerable transactions are constantly taking place in a quiet way, and that more sales have been made than many are aware of. The Quebec shipping houses have also done a large amount of business for f.o.w. shipment to United Kingdom; but very little of it for London. The competition between sellers has been keener than usual this season, especially during the last few weeks.

The London Board of Trade returns for last month were issued on the 9th March. They are very favorable, particularly as regards the exports, which show an increase under all the leading heads. The declared value of the imports was £28,513,994, against £26,621,869 in February, 1886, the items which have augmented most being articles of food and drink, raw materials for textiles, and manufactured articles. For the two months to date the increase is £4,256,508. The value of the exports last month was £17,255,133, against £16,384,007 in February, 1886—an improvement of £871,126, which is mainly in yarns and textile fabrics, metals, machinery, and apparel. The gain for the two months is £1,567,080. The great expansion in yarns and textile fabrics continues to be chi fly due to the extended scale of shipments of cotton goods to the Eastern market, more especially India.

The shipbuilding industry at Tyne is looking up. Many of the yards are better employed, and two of the yards which have done nothing for some time, are commencing active operations. This will favorably affect the log trade, and as the stocks of Quebec goods are becoming very light, it should stiffen prices. Some of the Quebec shippers have been here trying to place cargoes for spring shipment; but so far, only one Tyne firm is reported to have bought. 21s to 22s. Quebec to Tyne is quoted for spring shipment.

Canadian woods to the Liverpool markets are reported by Farnworth & Jardine as follows:—Yellow pine timber: The deliveries as is usúal at this season of the year. have been small; the stock is very moderate, but there is no improvement either in the demand or value. Red pine is seldom inquired for, and prices rule low. Oak logs:—There has been a moderate enquiry for prime wood, but inferior quality is neglected. Oak planks have been imported moderately; the demand continues good, and prices are firmer, and the stock remaining over is light. Ash is in fair request, and the stock is low. Pine deals are in dull demand: the stock is far to heavy, and prices nnchanged. Quebec staves are seldom inquired for. From New Brunswick the following is reported —The import has consisted of two small cargoes; there has been a fair demand throughout the month, and the stock is now reduced to a more healthy condition; notwithstanding this, prices do not improve, aud several sales have been made on contract for the season's shipment at very low rates. Pine deals are in dull demand, and the stock is sufficient. Birch: Only one parcel has been imported, which has chiefly gone direct from the quay into consumption; there has been a fair demand, but late sales show a slignt decline in value, and the stock is ample. Birch planks:—Several sales have been made on contract but at rather lower prices.

THE LUMBER WORLD.

A scheme is being worked up by Mr. E. H. Bronson, M.P. P., for the purpose of building at the Chaudiere mills for the manufacture of pulp out of sawdust. Mr. Bronson has been encouraging the scheme for some time and it is expected that before long a company will be formed with a large capital, a powerful water power at the Chaudiere purchased and extensive mills erected for the manufacture of pulp from the sawdust which has for so long been a nuisance to both lumbermen and forwarders. This idea of manufacturing paper from sawdust has several times been attempted in this city and very favorable results obtained, but the want of capital caused the abandonment of the enterprise. Should Mr. Bronson's idea be carried out and a company formed with a sufficient capital to start the work of manufacture there is little doubt but that success will aftend the efforts of the company, as paper is now being manufactured in many places throughout the United States from sawdust, at a great profit to the manufacturers. Besides, if this idea was carried out we would get rid of a vast amount of that sawdust against which so many protest. A *Journal* reporter called upon Mr. Bronson's manager but could obtain no furter information beyond the confirmation of the fact, as Mr. Bronson is himself in Toronto and the scheme is not as yet sufficiently matured for publication. Mr. Bronson, it is said, has purchased Thompson's grist mill at the Chaudiere, and his firm intend to convert it into a paper pulp factory.—*Ottawa Journal.*

Bobcaygeon *Independent*:—The immense territory to the north of this village is still in a great measure clothed with the primeval forest, for settlement is so slight and scattered that no material change has been made in the original condition of the country. It is true that a large proportion of the pine has been cut and removed, but the forest has been but little changed in its character and thousands of square miles are yet untouched by the axe of the settler. Throughout this immense territory the best, most thrifty and largest timber is that of the black birch which grows everywhere in rich profusion. Up to the present time but little of this timber has been used for other purposes than fuel, but it would seem that its valuable qualities are at length beginning to be recognised. There is probably some exageration in the price mentioned, for black birch is a wood of too universal a growth throughout the Canadian forest to permit of so rapid a rise in price, but a general increase in its value may be safely calculated upon in the future. It is a beautiful furniture wood and becomes of exceeding hardness with age. Its present value is probably not more than $14 or $15 per thousand, but as soon as the price advances to $18 or $20 there will be an opening for an enormous trade. The supply is unlimited but as the logs cannot be floated in water, they have to be transported on the railway, and at a less price than that mentioned they can not be profitably handled. Those settlers in the back country who possess black birch within handling distance of a railway would do well to hold them, for their value is certain to become greater.

VALUE OF CANADIAN WOODS FOR EXPORT.

By Prof. John Macoun.

NOTES culled from the Indian and Colonial Exhibitions and a few practical observations founded thereon, may not be in appropriate in the coming issues of The Lumberman. At the present time much attention is given in England to woods of every description for the purpose of getting new material for both house decoration and carriage building. The Colonial and Indian Exhibition held out inducements to the various experts and wood-workers in London and the Provinces, to come up to the Exhibition and examine the woods from the various Colonies and India. This was soon taken advantage of and numbers came daily to examine and criticise. Generally speaking the woods from the other colonies claimed more attention at first, as they were brighter colored, closer grained, and more attractive looking, but as the novelty wore away it was discovered that these woods were very heavy, hard to work and in many cases so scarce that their introduction to the English market was an impossibility.

Following closely on the opening of the Exhibition came the reporters of the various scientific publications, and these found much to admire and to praise in our timber exhibits. We were kept busy from morning until night giving notes and answering questions. These in a short time bore fruit as parties soon came forward to make enquiries as to the best means to be employed in opening up a trade with Canada for the various species of hardwood which we have so abundant n many districts.

* * *

The senior partner of the largest chair manufacturing company in England, located at High Wycombe, called upon me and after talking the matter over and examining our specimens asked me to put him in communication with some parties in Canada, which I did. He would guarantee to take $35,000 worth every year, but not in the form of square timber, but just in the round log and short lengths. My discussion with him brought out the fact that there is much difficulty experienced in England, from overcharges on railways than in Canada, and that the great cause of a want of success in the timber trade is the middlemen in combination with the railways. It costs as much to carry a single barrel of apples from Liverpool to London and deliver it as it does to purchase it in Canada, carry it 1000 miles on land and 2500 miles by sea to Liverpool. Dealers g t more *liberal* rates, and the business by this means is kept in the hands of a few.

* * *

When it is considered that English beech is getting scarce, and that there are at least 20,000,000 of people in England who sit on common chairs, the importance of this trade cannot be over estimated. My advice to Englishmen was always the same : open up communication with our lumbermen, get them to cut all kinds of timber to the sizes required, immediately after being felled, and ship nothing that would by any possibility become waste or would be difficult to handle. I had a double object in this advice, one was to employ our own people and the other to prevent deterioration by rotting, caused by the decomposition of the sap.

* * *

This naturally leads to the all-important question of cutting and drying. Pine timber, cut in winter and put in the water in spring and floated down to the mill and only taken out of the water to be sawed into lumber, remains perfectly sound, and the sapwood often quite white. Hardwoods and pine, but especially the former, are drawn to the various local mills and perhaps allowed to lie all summer exposed to the heat and rain without apparently a thought being given to the injury already done or any attempt made to protect it from further injury. A careful perusal of that section of my paper, read before the Coachmaker's Institute in London, which deals with the "deterioration of woods after cutting," will make clear to any one the absolute necessity of a complete change in our present mode of procedure in this respect.

* * *

Following closely on the footsteps of the Chair-makers came the Coach-builders with their multifarious wants. Some wanted spokes, others hubs, shafts, or materials for bodies, but none seemed to know anything of Canadian wood, With the permission of the various leading coachmakers in London, I examined their stocks and saw their modes of seasoning and of course heard the praises of English oak and ash, and soon became convinced that our plan of shipping hardwood to England was altogether at fault.

* * *

Ransome & Co., of Chelsea, experimented on fourty-five different species of woods from India and the Colonies, and amongst others who addressed the meeting was the writer. A few days after in conversation with an eminent engineer he remarked that our wood—ash and oak—bore no comparison to theirs as regards toughness and elasticity. Further enquiries showed me why our wood was condemned by practical men, and this subject I also took up in the paper read before the Coach-builders Institute, (the report of which appeared in the last issue of your paper,) in the section on "toughness." Conversations following the reading of the paper showed me that I had made an impression on the general public and that many of my hearers believed my statements.

* * *

One dealer came to see me about elm hubs, who supplies many of the omnibus builders with the material for wheels. He told me the young tough elm which grew so plentifully with us was just the material he wanted, and he was prepared to take immense quantities either in the round log with the bark off or sawed the proper lengths for a hub. I found that the American Rock elm in London, was chiefly our common elm, and much of that which came as square timber was gray elm or common elm grown on dry soil. Large white oak spokes are wanted by the same firm, but many complaints are made of the unreliability of the dealers. Only a few weeks before our conversation a large consignment of spokes had been received and a cablegram despatched to repeat the order. When the latter lot arrived they were much inferior to those sent at first. The first lot were real white oak (*Quercus alba*) but the second while still white oak, was the more brittle species (*Quercus Macrocarpa*).

* * *

A very profitable business could be done in these lines by men with a little capital, getting a portable sawmill and just cutting up on the ground, where people are clearing land, all the smaller of the valuable trees that are now worse than wasted. It is now high time that our farmers and others, owning tracts of half grown trees, should realize their great value as permanent remunerative property. Owing to the increase of population and the ever increasing demand for agricultural implements, suitable timber will become more and more difficult to obtain, and when this time arrives the man who has a tract of young hickery, ash, oak or elm, or all intermixed, will have a mine of wealth of untold value. At present the Americans are seeing the end approaching, and are looking with longing eyes at our wealth of forest lands. The timely export duty on logs will do something to retard the the wholesale destruction of our pine forests, but to these as to everything else there is a limit and the end will surely come.

* * *

Passing from wheels to bodies I found that mahogany was the chief wood used. White wood (*Liriodendron Qulipifera*) was used for a variety of purposes and so was Sycamore (*Platanus occidintalis*) or Button wood. When I asked about Basswood no one seemed to know much about it, but the tests we subjected it to showed them its valuable properties, and make it the coming rival of mahogany when color is not a requisite. At present mahogany is eighteen cents the square foot inch measure, and basswood could be delivered at less than one third the cost. Before I left London I introduced Mr. Bennett, of the "Bennett Furnishing Company," of London, (Canada), and Glasgow, Scotland, to a number of gentlemen engaged in the business, and before I left he had taken a number of orders for sample lots of oak, ash, hickory, basswood, and elm at eight cents a foot per small orders. Since then he has obtained the contract of furnishing all the city schools of London with desks for three years. I mention this to show what may be done by coming in contact with men who are desirous of doing business in the changed conditions of the present active age.

* * *

Yellow pine deals as our "White Pine" is called, hardly reaches London at all except by way of Liverpool. I made numerous enquiries about it and never succeeded in finding any except what came by rail. Arnold & Co., of the Royal Dockyard Wharf, Woolwich informed me that the present mode of shipping timber from Canada, greatly curtailed the trade and in many cases stopped it altogether. This firm receives square timber from Quebec, and on its arrival it is thrown into the water and lies there until it is wanted for a customer, when it is drawn out, if the tide suit, and is sawed up as the customer may desire. Should the tide not suit, Norwegian or Archangel deal or scantling is sold instead, as it is always cut before shipment, in Norway, to the size the London market requires. Having noticed the various Ottawa lumber merchants cutting from six inches to two feet off the ends of most of their deal, I enquired if that were necessary, and was answered by being shown Norwegian deal from six feet to twenty-eight feet long. In Norway they take all they can out of the tree and do the sawing in their own country. I was informed by the foreman that in the five years he had charge of the yard a whole log of ash or black birch had never been bought. He wondered with me why we cut away so much of the tree and then sent the heart, which every one knew was the poorest. While in conversation he counted up the cost of sawing 750 feet of ash out of the square log as it lay in the pond. The sum total was £1.17.6 or about $9.-50 in our currency.

* * *

I am quite convinced that the days of squared timber have departed, and that the sensible, economical, and profitable plan is to have an intelligent agent who knows the requirements of the market, and have all lumber manufactured to suit the wants of the purchasers. If this be done it would place lumbering on a more certain basis and give a far wider market for one of our most important industries. Squaring timber belongs to the time when sawmills were not in existence and as it has served its purpose the sooner such work ceases the better. Quebec has filled her cup to the brim by being ruled by the Longshoremen. The middle-men in England are in the same positions and the producers and consumers are looking forward to a closer union which will be of mutual advantage. By doing business like merchantile men lumbermen can get a share of the profit by shipping direct from Montreal to London. The Tilbury Docks, twenty miles below London, are now open and Canadian lumber can go direct to London without being re-shipped at Quebec and Liverpool as much of it is now.

* * *

Another most important product is the pulp that has become such an article of trade in a few years. At present England imports immense quantities from the North of Europe, but the matter has only to be taken up in an energetic manner in Canada and a valuable business will soon be established. It is only a matter of time, perhaps in the near future, when balsam, spruce and the refuse of pine and even sawdust will be made into pulp, and no prophetic powers are needed to fortell the thousand and one uses to which such material will be put.

CANADIAN PACIFIC ACQUISITION.

That the Canadian Pacific railroad will one of these days raise Cain with some of its American competitors may be seen in the following despatch from Boston :—Quickly and surely the Canadian Pacific is completing its control of access to the Eastern seaboard. The latest move on the checker-board is the lease of the Connecticut and Passumpsic rivers railroad to the Boston and Lowell, which, though not yet consummated, has progressed so far as to become a practical certainty. The Directors of the Passumpsic road considered the matter to-day, and it is understood that they talked very favorably of the Lowell proposition. Whatever conclusion they reached will be indorsed by a good majority of the stockholders. The Passumpsic line is something over 100 miles long, and runs from White River Junction, Vt., north to Sherbrooke, Canada, thus forming the connecting link between the Boston and Lowell at White River Junction, or Well river, and the Canadian Pacific at Newport. Obviously its acquisition will be of great importance to the Canadian Pacific and the Boston and Lowell in carrying out their far reaching plans.

THE MANUFACTURE OF EMERY WHEELS.

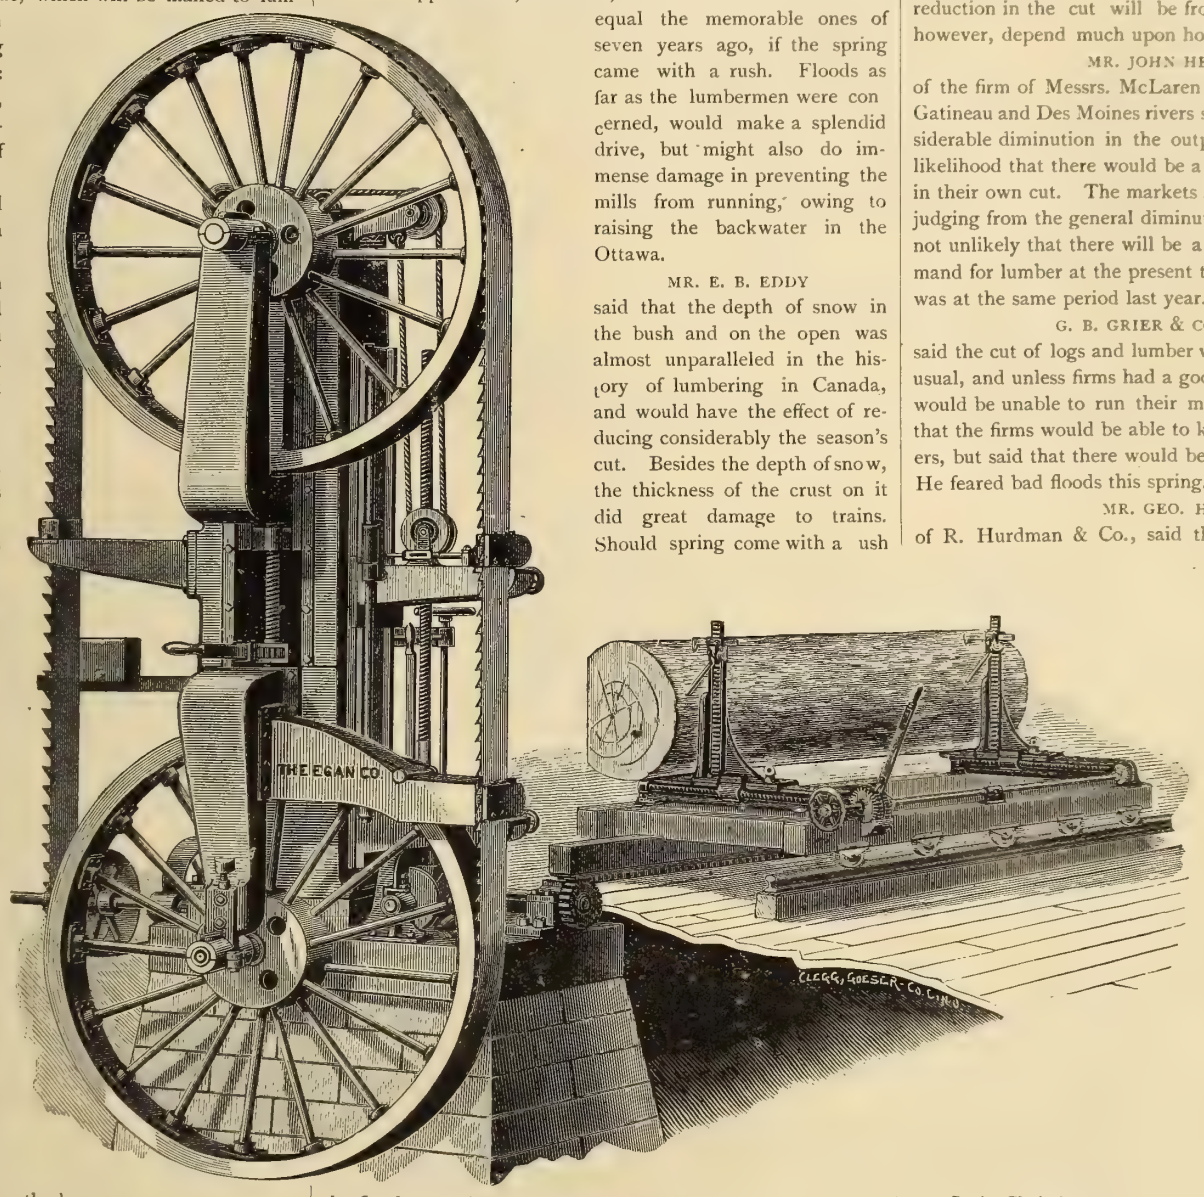
Among the outfits of saw mills there seems to be one article that of late years has proved itself indispensible. Both for gumming and sharpening saws, Emery Wheels are in great request. No makers of these goods have a higher or more extended reputation than the manufacturers of the "Hart" Wheel. It has become well known in Australia, India is a customer, France and England are steadily using them, while in the United States and Canada, probably as many are used as of all other makes together. Besides a large factory in Detroit there has been for the lasst even years an establishment in Hamilton, Canada, where the Hart Wheel is made. In the latter place besides manufacturing emery wheels a large number of mechanical devices for running emery wheels are turned out every year. Prominent among these and of interest to our readers is the line of RogersPatent Saw Gummers and Sharpeners.

Mr. S. C. Rogers, one of the directors of the Hart Emery Wheel Co., of Hamilton, has invented a very complete yet low priced devise for grinding circular saws, and also three machines for sharpening them. One of these is illustrated in an advertisement on another page. These circular saw filers will take respectfully 36 up to 48 and 72 in. circular saws, and will sharpen cross-cut saws also. There is in addition a device, (forming an attachment if needed) for the three machines which sharpens up to 72, for sharpening gang saws.

These files although not automatic may claim to be semi automatic, for the shape of the teeth and the degree of filing they need are fixed by positive stops and guides, at the will of the operator in such a way that all the teeth are filed alike. Any part of a tooth can be filed, the throat, back, breast, or point only. Having set the machine to do the work, the operator has nothing more to do than to move a lever back and forth. This motion works both the saw and emery wheel so that the latter comes in contact with just that part of any tooth that requires sharpening. The work is done wholly with emery wheels, no files are needed as the saw is finished by the machine ready for use.

NEW BAND SAW MILL.

THE economical production of lumber is a point to which lumbermen have been giving considerable attention lately. The introduction of Band Saw Mills into mills in the U. S. has been attended with considerable difficulty. Lumbermen admitted the economy of the Band Mill, but doubted its efficiency and utility. Consequently the tests that band mills have had to undergo, have been in many instances severe. The Egan Company, of Cincinnati, Ohio, U.S.A., sold a Band Mill to a lumberman of that city and he set it just across the logway from a circular, so that the cut and general behavior, figuratively speaking, of the two mills could be closely watched and compared. Of course the circular mill cut the most lumber, but it was evident that the great saving of the band mill, together with the finer quality of lumber it produced, overcame by far, the difference in the amount cut, and at the end of thirty days, the circular mill was taken out and a band mill put in its place. We illustrate on this page, the Egan Company's latest Band Mill, embodying many new and advantageous improvements over any other band mill now built. The following detailed description of this mill is taken from the Company's Catalogue, which will be mailed to lumbermen and wood-workers on application, and mentioning the CANADA LUMBERMAN :



The column is cored out, and is the stiffest that mechanical skill can construct of iron.

The base is also cored, and is braced for great strength and strain.

The axles or shafts, both above and below, are of steel and large in diameter ; both shafts can be lined up, and the lower shaft boxes are not on the base, but in separate, independent adjustable boxes.

The outside bearings on both upper and lower shafts are adjustable.

The upper shaft has boxes and bearings almost five feet in length, and in the solidity and construction of this shaft and bearings we excel all other manufacturers.

The wheels are 8 feet in diameter and 10½ inch face. They have staggered spokes, and are very stiff, with extra heavy rims and hubs, and will stand a speed of 1,000 revolutions per minute without springing, and will carry a 10-inch saw blade.

The guides are very perfect, and have a "throw" of about ½ inch so as to clear the log in gigging back. The patent rollers at back of saw are much improved in their arrangement, and prevent the saw from becoming crystalized and cracking. The last plank can be cut to 1 inch without raising the guide above the knees.

Head blocks of any special manufacture will be furnished to suit purchasers, or they can buy what suits them, and we can make the carriage to order. If desired we can adapt the mill to suit any carriage parties may have.

The feed can be either friction feed, rope feed, or steam feed. Many of our latest mills have been furnished with rope feed, and it has given general satisfaction, working very easy and without a jar. The steam feed has also given good satisfaction on our new mill, and where the carriage and logs are heavy and fast sawing is wanted, it is a great improvement.

The mill is built in the most perfect manner. The best materials are used throughout, and we test and run the mill in our works before shipping, and will warrant it in every way.

For further information, prices of this or cuts and prices of any other Improved Wood-Working Machinery, address the manufacturers, The Egan Company, 176 to 196 W. Front St., Cincinnati, O., U. S. A.

—The saw-mill at South River, formerly owned by Mr. Erb, has been purchased by a firm of Americans who intend extending and refitting it. The price paid is said to be in the neighborhood of $3,000

REDUCTION IN THE OTTAWA LUMBER CUT.

IT is a common subject of remark that the present winter's snow-fall has been almost unparalleled. Reports from various parts of the country speak of the great depth of snow in the woods, the consequent bad roads and general unsatisfactory state of affairs in the country.

The following information, kindly given by representatives of the big Ottawa Valley lumber firms to a *Journal* reporter, show how the snow is affecting them.

MR. J. R. BOOTH

said that the difficulty experienced this winter by the lumbering firms in the Ottawa districts in cutting and getting out logs and timber will have the effect of lessening the cut by at least one-fourth. This reduction in the amount of timber cut will of course lessen the amount of lumber sawn during the summer and unless all the firms have a large reserve of logs from last spring many of the mills will have to shut down before the summer is over. In cases where lumbermen sell their whole season's cut before they begin to saw it this state of affairs may prevent those who do so from keeping their contracts, but most of the large firms sell only a part of the season's cut beforehand.

To all appearances, he added, the floods this season would equal the memorable ones of seven years ago, if the spring came with a rush. Floods as far as the lumbermen were concerned, would make a splendid drive, but might also do immense damage in preventing the mills from running, owing to raising the backwater in the Ottawa.

MR. E. B. EDDY

said that the depth of snow in the bush and on the open was almost unparalleled in the history of lumbering in Canada, and would have the effect of reducing considerably the season's cut. Besides the depth of snow, the thickness of the crust on it did great damage to trains. Should spring come with a ush the floods would be terrible and might do much damage in stopping some of the mills from working till late in the season owing to the height of the backwater. The amount of sawn lumber that will be turned out during the summer was sure to be much smaller than for years previous.

MESSRS. PERLEY & PATTEE'S MANAGER

said the lumber cut would be reduced one-fourth. At present all hands were engaged in cutting roads and hauling the logs to the creeks chopping being to a great extent stopped. Last fall was splendid for log making, and large quantities were made and piled in the bush, so that notwithstanding the reduced cut there was plenty to do. Lessening the cut at least a quarter, and where firms have not a good reserve of logs, it will effect the amount sawn.

Big floods, he thought, were inevitable, and injury would be done to the mill business, especially to those mills whose wheels are low, by the water in the Ottawa rising and preventing some of them from running for a month or so.

MR. BRONSON

of Bronson & Weston, said that the state of affairs in the shanties was very unsatisfactory. The great depth of snow which had only been equalled by the spring of seven years ago, would have the effect of very much lessening the number of logs turned out. His own firm, he said, would, however, have a sufficient supply of reserve logs to keep them running all summer. He thought from appearances that bad floods were probable, and that some damage might be done by the mills being prevented from running until the water lowered.

MESSRS. GILMOUR & CO.,

who have extensive lumber operations on the Gatineau River, state that the depth of snow in the Gatineau districts is unparalleled in the remembrance of the oldest inhabitants, and never was the work of cutting and getting out logs more retarded. Nearly all choppers had been set to work hauling and breaking roads for the teams in order to get hauled all the logs which had been cut during the season. This would lessen the cut at least 25 per cent., and will have some effect upon the cut of timber at the mills.

MR. HIRAM ROBINSON,

general manager for Messrs. Hamilton Bros., said : "Lumber operations have been going on by our firm this season on the Gatineau and Des Moines rivers, and it is my opinion that the output will be considerably reduced. Our men who have been cutting are now shovelling snow and breaking the roads for the teams, hauling logs that are cut and piling up. The probable reduction in the cut will be from 15 to 20 per cent. ; it will, however, depend much upon how the season may wind up.

MR. JOHN HENDERSON,

of the firm of Messrs. McLaren & Co., who have limits on the Gatineau and Des Moines rivers says that there would be a considerable diminution in the output of lumber. There was a likelihood that there would be a decrease of about 25 per cent. in their own cut. The markets at present are very steady, but judging from the general diminution in the cut this year, it is not unlikely that there will be a rise in the prices. The demand for lumber at the present time is very much less than it was at the same period last year.

G. B. GRIER & CO'S MANAGER,

said the cut of logs and lumber would be 25 per cent. less than usual, and unless firms had a good supply of reserve logs they would be unable to run their mills all summer. He thought that the firms would be able to keep their contracts with buyers, but said that there would be no reserve logs for next fall. He feared bad floods this spring.

MR. GEO. HURDMAN

of R. Hurdman & Co., said there would not be nearly the quantity of logs got out this season as there was last. "We have stopped most of our choppers and have them engaged in getting out the logs already cut. This shortness in the cut will not effect our cut of lumber at the mills as we have a large reserve of logs on hand. I expect we will have bad floods if spring opens early. This will of course make a good drive and enable lumberman to get their logs very early."

MANITOBA AND THE NORTH WEST.

—The annual report of the Winnipeg Board of Trade places the business done in lumber last year at $1,342,000.

—J. A. Christie, lumber dealer, Brandon, talks of giving up the retail trade at that place.

—Mr. T. E. Martin, of Regina, N. W. T., has commenced importing lumber from the mills at Vancouver B. C. If satisfactory rates of freights and terms of purchase can be secured, he expects to do a large trade.

—Frank Dick, lumber dealer, Calgary, N. W. T., has sold out his stock and business at that place to Fred Robinson, proprietor of the Beaver saw mills, B. C. F. Dick will continue as manager of the yard at Calgary.

—Manitoba advices state that the immediate demand for lumber is almost nil at the present time, and very little business expected before the first of April. It is probable that the cut will be in excess of last year. Dealers feel that prices are too low, and think they should have an advance of from $1 to $3 per M. They furthermore think that the improved condition of the trade, consequent upon the reduction of old stocks, would warrant them in advancing prices. The only trouble in the way is the lack of union among mill men, and the apparent suspicion with which they regard each other. It is hoped that some arrangement may be come to whereby a regular schedule of prices may be arranged, on a common sense, business basis.

ADVERTISEMENTS

THOSE wishing to **BUY** or **SELL TIMBER LANDS, LUMBER** or **SECOND HAND MACHINERY** will find THE CANADA LUMBERMAN an excellent medium in which to make known their wants. Advertisements of this character will be inserted at the low rate of **ONE CENT A WORD**, cash to accompany the order in every case. Address

TRADE REVIEW.

TORONTO.

March 28th, 1887.

From our Own Correspondent.

With the opening of spring the lumber business is beginning to assume a degree of activity and the outlook for the coming season is being regarded as decidedly encouraging. Prices remain unchanged, a tendency towards an advance bill stuff being about the only noticeable alteration. There seems to be a scarcity at present of dry lumber, several dealers reporting their stock as lighter than for years past. This will make a demand for green lumber as soon as the mills commence operations. The only thing that may interfere with what promises to be a good season's trade is strikes, but from present indications such is not likely to occur. Building operations are going on here as rapidly as ever, and this will not only make a boom in the lumber trade, but also furnish plenty of employment to mechanics and laborers. Those of our lumbermen who operate or are interested in mills in Simcoe and Muskoka territory report that their cut will be from 25 to 50 per cent. heavier than is customery. The output will therefore be considerably larger.

The following are the ruling quotations in this city at present :—

Mill cull boards and scantling	$10 00
Shipping cull boards, promiscuous widths	12 00
" stocks	13 00

Black ash 1 & 2	20 00@25 00

MONTREAL LUMBER MARKET.

MONTREAL, 24th March.

There has been no special activity in the lumber market since our last report, bad roads have still mulitated considerably against country business, and the demand fell off largely. Dealers are anxiously looking forward to spring for an increase in trade. Business this month so far, does not show an increase over the corresponding portion of last year, and most likely by the end of the month we will find that there has only been an average trade done. Advices from the lumbering districts say that only about two thirds of the average cut of logs will be made this season, owing to the immense quantity of snow in the woods. Consequently there is a prospect of an advance in prices in the spring, as the stock left over from last year at the mills is very light.

An early opening of navigation is anticipated here, and several charters for lumber freights have been made from Quebec to the Clyde at 19 s. There is no change as yet to note in prices.

The following are the quotations of the yards here :—

Pine, 1st quality, ₱ M	$00 00@40 00
Pine 2nd " "	00 00@30 00
Pine, shipping culls, ₱ M	14 00@16 00

Shingles, 2nd, ₱ M	2 50@ 0 00

HAMILTON.

HAMILTON, MARCH 15th.

The lumber trade during February was dull in the retail yards, and although the trade was dull prices were firm. Now that the weather is moderated and the snow all gone, and considerable building has started, trade is reviving in the yards and prices are being fairly maintained, and the prospects are very good for a fair seasons business. Advanced prices are looked for in some lines.

The following are the ruling prices in the retail yards :

Mill cull boards and scantlings	$ 9 00 to $10 00
Shipping cull boards, promiscuous widths	10 00 to 12 00
Shipping cull stocks	13 00
Scantling and joist up to 6ft	13 00
" " 18ft	13 00
" " 20ft	14 00
" " 22ft	15 00
" " 24ft	16 00
" " 26ft	17 00
" " 28ft	18 00
" " 30ft	10 00
Cutting up plank 1½ and thicker, dry	20 00 to 25 00
Cutting up boards	20 00
Dressing stocks	16 00 to 18 00
1¼ flooring, rough	16 00 to 18 60
1¼ flooring, rough	16 00 to 18 00
1¼ flooring, dressed face measure	32 00
1¼ " " "	25 00
1 " " "	23 00
1 Beed sheeting	28 00 to 30 00
Picks A M. Inspection	30 00
Three Uppers A. M. Inspection	40 00
XXX sawn shingles per M	2 75 to 2 90
Sawn Lath	2 25
Red oak	20 00 to 25 00
White oak	25 00 to 30 00
Basswood No. 1 and 2	18 00 to 20 00
Cherry No. 1 and 2	50 00 to 60 00
White Ash No. 1 and 2	25 00 to 30 00
Back Ash No. 1 and 2	20 00 to 2 00

CHICAGO.

CHICAGO, March 18th, 1887.

From our own Correspondent.

The lumber trade has been booming here all through March and prices have advanced accordingly. I think the output here will exceed that of any previous corresponding month for several years past. The cause is generally assigned to the effect of the "Inter-State Commerce Bill" as the railways have advanced their western freight rates to take effect April 1st, consequently some of the yards here who are interested in 15 or 20 branch yards each in the west have been pushing shipments for all they were worth, not only from their own yards but from all others where they could buy anything at a fair price. One firm alone here have shipped on an average over half a million per day on cars from their own yard all this month and part of last month. The prospects for the regular country trade are only fair and so far country yard dealers have been ordering very little. Farmers can not do any very great amount of building with wheat at 75 to 80 cts. per bushel, and other produce in proportion, so I conclude we will not be over run with country orders this spring. The stock of dry lumber on hand here now is considerably short of what it was a year ago and this assortment very much broken up, there being plenty of good lumber on hand to meet all requirements, but a scarcity of the lower grades, and my latest information from Muskegon is that about the same state of things prevails at the mills, consequently we need not expect much dry lumber from there when navigation opens up, which by the way will not likely occur before April 15th or 20th. About six firms going out of the yard business here, May 1st, and any amount of Dock property to rent which is quite a change from a few years ago when it was impossible to get a yard location at any price. At a lumberman's annual blow out, which occured here a short time ago, the *Chicago Tribune* reported S. K. Martin, as saying (when speaking his little piece) that "*the brains* of the lumber trade was right here in Chicago." How is that for a case of "swelled head." There is no doubt as smart men in the lumber trade here as anywhere, but the sun does not rise and set in Chicago. I enclose price list, &c.

EXCHANGE ECHOES.

Lumberman's Gazette, Bay City, Mich.—There has never been a winter since the first saw mill was erected in this country where there were so many mills in operation, and so much lumber and timber manufactured as during the winter of 1886-7 just closing. This shows unusual activity in the trades which demand timber and lumber for their prosecution, and expected activity in railroad rolling stock building.

* * *

Ottawa Free Press.—Lumbermen generally express themselves quite pleased at the outlook for the coming season. Notwithstanding the passage of the Inter Commerce bill the prospects for large and brisk sales are as bright, if not brighter, than in past years. This applies principally to the American and Canadian markets. As regards the English trade, however, one firm reports a decided falling off both in square timber and sawn lumber. On the other hand another firm reports that their business in these lines with the English market will be exceptionally heavy. Prices will certainly rule as high as last year, and the opinion is generally held there will be a shade of advance. Owing to the Inter Commeree bill coming into force on the 1st of April, there is a heavy rush to get as much of the contract lumber as possible shipped to the United States before that date, and complaint is made of an insufficiency of cars. The actual amount of lumber which will be manufactured this season will be much heavier than that of last year. Not one firm reports a falling off in this respect, while two firms, Messrs. Hurdman & Co., and Messrs. Grier & Co., report a decided increase; the former of about 25,000,000 feet and the latter of about 20,000,000 feet. The new mill which Messrs. Grier & Co. are building, will increase their manufacturing capacity enormously. The lumber manufacturing industry of the Ottawa Valley was never so prosperous as at present, and notwithstanding all the disadvantages under which it labors for want of a more reciprocative commercial policy with the United States, it can compete successfully in Eastern American markets with the Michigan lumber.

* * *

Monetary Times.—We have repeatedly besought the attention of mill-men, lumberers and builders to the desirability of a freer use of hemlock timber and lumber for building uses. The supply of pine will not last for ever; and it would be well to familiarize people with the fact that there is a wood easily available and will take its place for many purposes. This is coming into use in Canada, year by year, more freely. That hemlock is making progress in popular esteem in the States, too, is evident. The Bay City *Gazette* tells us that a larger product of this wood is looked for in Michigan this year than ever before. It is coming into competition with pine in the lake cities, and indeed it is no mean competitor, light and strong and durable as it is, especially when it can be furnished for two dollars less per thousand. Then again, as we learn from the *Timberman*, in Central and Southern Ohio the hemlock from the forests of western Pennsylvania has been coming in alongside the pine from States further west and for some purposes beating its rival. "Within the past year, the development of the Western trade in Pennsylvania hemlock has been very marked, and the indications are that the rise has but just begun." That journal ventures to declare that it is the bill stuff of the future, and is besides, successfully used for shingles. Pennsylvania makers turn out hemlock shingles and sell them, with a fifteen year guarantee, at prices which pine producers can hardly match.

WE respectfully invite all readers of "The Lumberman" who are not already subscribers to fill up this sheet and return same at once. Our offer to new subscribers is the most liberal yet published, and should be accepted by every member of the trade in Canada.

BEWARE OF THE SHODDY SPECULATOR.

TORONTO, March 18th, 1887.

To the Editor of the Canada Lumberman.

"This is the fool who lent money gratis."—*Merchant of Venice.*

It is a trite observation that history repeats itself. We cannot avoid enquiring: Are we on the eve of another stagnation in trade as was from '72 to '79, when the crash of falling firms was heard daily? In one of our Eastern provinces a bank has gone down accompanying an extensive lumber firm; in Great Britain Stewart Bros. have failed for $500,000; while south of us a monetary panic is predicted by the Solons of Wall street, and at home the feeling is not one of security, many houses being supported by flying buttresses.

It were well did lumbermen take something more than a superficial glance at the standing of the parties to whom the bulk of their sales are made, and endeavour to realize the fact that sooner or later a reaction will follow from which they will suffer the inevitable consequences of supplying men who have nothing to lose. As long as our speculative builders are able to make sales of the miserable tenements erected by them, so long can our dealers expect with a degree of certainty, to be paid a portion of the amount due them, but the moment any stringency is felt then payments cease, and the lumberman finds too late that he has supplied material to increase the value of the property mortgaged to the individual furnishing the cash.

It is worse than folly to ignore what is patent to all in the trade. We all know that sales are made to men who have not one cent to lose, and who, trusting to the future, expect to realize sufficient means to stave off the evil day. It is not to speculative builders alone that reference is made, but to contractors as well. Men eager to do an extensive business tender for work far too low, and having obtained the contract find that with a number of such low priced contracts on hand, they cannot attend to each as it deserves and are compelled to call a meeting of creditors at which a compromise is made of about 30 or 40 per cent. on the dollar to be paid in installments at 3, 6 and 9 months, the payments of which cannot be met as their assets are not in existence, but merely suppositious margins due on contracts, which have to be earned and subject to whatever may happen. The final winding up of the affairs of the ambitious incompetent builder is the result.

Competition among both the lumber dealers and builders is to a very great extent the cause of the evil. Nor can the real estate agent escape censure. Blocks of land are thrown on the market, (so far realizing more than their actual worth) easy terms are offered to such as will build. Houses spring up like Jonah's guard in a night—bad material, bad workmanship, and our pushing, energetic, speculative builder

"Fix'd on his house he leans; his house
And all its props decay;
He holds it fast; but, while he holds
The tottering frame gives way."

Notwithstanding the severe losses experienced almost monthly the lumber dealers continue to sell to a class of men the most worthless—men who in the majority of cases are not competent to correctly calculate the cost of a building, and in almost every instance have not the most remote acquaintance with the science of accounts. Scarcely one of our dealers but has been victimized by this unsavoury class, the shoddy speculative builder and his more pretentious brother the ambitious incompetent contractor.

Lumbermen have the remedy in their own hands, which if applied, will, to a certain extent at least, save them many a dollar obtained from small margins. Let them combine, if that can be done, and agree to supply material to none but those having some means of their own, or to such as can give the most satisfactory security, and above all, absolutely refuse all contractors who have taken contracts so low that there is not a fair margin to cover all contingencies.

CANADA.

NEW BRUNSWICK MATTERS.

MADAWASKA, N.B., March 21st, 1887.

To the Editor of the Canada Lumberman.

This has been one of the most discouraging winters for lumbering on the Upper St. John we have seen for many years. There will be a falling off of one-third the usual output. The great depth of snow we have had so long is decreasing rapidly, and, contrary to the general expectation, is passing away without causing floods. Quite a large quantity or logs are still left to haul.

The Vanburn Mills, on American side, start operations next week. There is annually shipped from this mill from 25 to 30 millions shingles, besides clap-boards and other lumber, all cut on this side, and shipped to the States without the payment of one cent of duty.

Holmes & Hammond expect to have their new mill running about the first of April. The principal machinery consists of five shingle machines. This new mill is situated opposite Green River, on American side, and it is expected that a large business will be done.

Our National Policy is like all first-class machines, easily disgraced by unskilled workmen and neglect, and through the neglect on the part of our Government officials, who are encouraging the robbery of our forest wealth by Americans, the benefits of which accrue to our neighbors instead of our own people. Canadian enterprise is being discouraged, and in a very few years, if the present state of affairs continues to exist, what little timber we have left will be stripped by Americans, leaving them not worth building mills on; whereas if a heavy export duty were exacted, our streams would be provided with mills and the ring of saws would testify to the opening up of additional labor, and encourage our children to hue out a home of their own in the land of their birth, who now are compelled to go abroad and seek work from those who have robbed us of our timber, and manufacture the same across the border. If this lumber was manufactured in Canada we could soon encourage a boom in milling, besides encouraging a channel to cultivate thousands of acres of our best lands into fields of wheat and other cereals, which now show nothing but the blackened stumps of hardwood, from which our spruce and pine have been taken.

I cannot see the policy of granting subsidies to railroads for the purpose of opening out our country, and then allow Americans to come over and rob our forests out of all the traffic required to support them after they are built. It is too much like a cow giving a good mess of milk and then kicking it over.

We have very little standing pine left on the river St. John, spruce is scattering, small and scarce; cedar is rapidly disappearing, and this year the American woodsman, in his eagerness to obtain a stock of logs at all hazards, cut from the top of the snow, leaving several feet of stump.

There seems to be a great cry among lumber monopolists over the high stumpage tax in New Brunswick, but to our mind the Government has acted wisely in this respect.

The only way to successfully open up our country is to restrict the cut of our lumber by adding more stumpage and export duty and manufacturing our lumber at home. In the near future agriculture must be resorted to in order to keep up our towns and cities instead of lumber, and the sooner politicians take this matter up the sooner there will be a boom in farming, and our province placed on a solid foundation.

A new line of railway has been run out from Campbelltown, Restigouche, to Grand Falls, which will open out one of the finest tracts of land in New Brunswick, besides bringing this upper country within one hundred miles from the seaport, making a market for Restigouche fish and a channel through which to ship our lumber. Many of our people are talking about locating on this line.

Yours truly,
P. O. BYRAM.

GRAVENHURST, March 24th, 1887.

To the Editor of the Canada Lumberman,

The stocking on Muskoka River and its tributaries is about completed, the following quantities being for Gravenhurst: Mickle, Dyment & Son, 12 millions; Ontario Lumber Co., 8 millions; Thomson & Baker, 7½ millions; Isaac Cockburn, 6 millions; McBurney & Laycock Co., 6 millions; Thomas Tait, 4 millions. The drive on the Muskoka River this year is expected to be about 60 millions. Snow still very deep and no prospects of going off as yet.

The cost of stocking has been considerable in excess of the estimate, mainly on account of severe snow storms.

Repairs on the mills have commenced, and owners anticipate a good season. Yours truly,

LUCIUS.

NOTICE to CONTRACTORS

CHANGE OF TIME.

THE time for seeing the Plans and Specifications for the

NEW EXAMINING WAREHOUSE AT OTTAWA,

is hereby extended to Monday, the 21st February, and the time for receiving tenders to Tuesday, the 8th March.

By order,

A. GOBEIL,
Secretary.

Dept. of Public Works,
Ottawa, 12th Feb., 1887.

CANADA AND WEST INDIES.

TENDERS FOR STEAMSHIP LINES.

TENDERS will be received at the Finance Department, Ottawa, up to and including the 1st day of May next from persons or companies, for the performance of the following steamship services, viz:—

1st, a line of mail steamers sailing from Halifax to Havana, thence to Kingston, thence to Santiago de Cuba, thence to Canada; and (2nd) a line of mail steamers between Canada and Porto Rico and adjacent islands. Trips to be made by each line fortnightly. Steamers to be of a size sufficient to carry 2,000 tons of cargo, and to be able to steam twelve knots an hour, averaging not less than eleven knots an hour. The contract in either case to be for a period of five years. Tenders will be received for the above services either separately or together. Tenders to be marked on the outside "Tenders for Steamship Service to West Indies." The Government of Canada do not bind themselves to accept any tender.

By command,

J. M. COURTNEY,
Deputy Minister of Finance

Finance Department,
Ottawa, 7th Feb., 1887.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from misrepresentations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlasses, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.

SEND FOR PRICES

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for New Examining Warehouse, &c., Ottawa," will be received at this office until TUESDAY, 1st March, for the several works required in the erection and completion of the

New Examining Warehouse, &c.,

—AT—

—OTTAWA.—

Plans and specifications can be seen at the Department of Public Works, Ottawa, on and after MONDAY 14th February.

Intending contractors should personally visit the site and make themselves fully cognizant of the work to be done, according to the said plans and specifications, before putting in their tenders.

Persons tendering are further notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque, made payable to the order of the Honorable the Minister of Public Works, *equal to five per cent.* of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, January 27th, 1887.

EVERY *MAN who is in any way interested in the Lumber and Wood-working industries of the country should send ONE DOLLAR for a year's subscription to the Canada Lumberman. The investment is a small one and will pay you ten-fold. Sample copy sent to any address on application.*

English Timber Trade

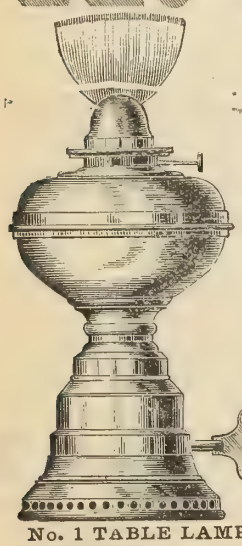
Timber reports trade in England in American black walnut as very quiet and principally of a hand to mouth character, with little disposition to purchase stock on speculation The logs sold recently brought very fair prices. Stocks are moderate, there is an improving dema d, and the prospects are very favorable. The dem nd for American whitewood keeps up well. Planks and boards seem to go off more readily than logs, but of the last named there are some very good parcels in the West India Docks, for which the importers seem to be very firm in their prices. The consumption of sequoia (California redwood) has not increased so much as expected. It does not seem to be taken to so freely in Europe as is the case in the United States and in Australia.

The aroma of red cedar is fatal to house moths; the aroma of black walnut is fatal to fleas It is a matter of common observation that persons engaged in the business of making shingles from odoriferous cypress timber in malarial districts are rarely, if ever, affected by malarial diseases, and that persons engaged in distilling turpentine do not suffer from either malerial diseases or consumption. It is said that when cholera was epidemic in Memphis, Tenn., persons working in livery stables were entirely exempt from it. It is affirmed that since the destruction of the clove trees on the island of Ternate the colony has suffered from epidemics unknown before; and in times when cholera has prevailed in London and Paris, those employed in the perfumery factories have escaped its ravages.

The Rathbun Co. have introduced into the Cedar Mill two new Perkins' patent shingling machines, manufactured by the William Hamilton Manufacturing Co., any, of Peterborough. One of them was tested last Friday and made 106 cuts per minute, turning out in one hour 5,250 shingles. The shingle department is now turning out 100,000 shingles per day.

The Wanzer Lamp

Patented at Home and Abroad, 1886.



No. 1 TABLE LAMP
Produces a fine, clear, 50 candle-power light. Consuming only Half Pint of Oil during 6 Hours.

50 CANDLE-POWER

No Chimney! No Smoke! No Odor!

Positively Non-Explosive!

No Heat around the Oil Well!

Every Lamp Guaranteed

OUR LAMP is all we claim for it, being positively non-explosive, the oil being kept continually cool, consuming only half a pint of ordinary coal oil during six hours burning; using only an inch wick, and producing a fine clear 50 Candle Power light. No chimneys are required, but ordinary globes or shades may be adjusted to it. No smoke or offensive odor. Water can be heated in a few minutes. Tea or Coffe made, and Oysters Cooked, &c., without obstructing the light. Reflectors of entirely new designs for both out-door and in-door use are furnished at low figures. Made in all styles—Table, Hanging, Library, attach to Chandeliers, Gas Fixtures, etc. *Agents wanted where territory has not already been taken.*

R. M. WANZER & CO., - - - - Hamilton, Ont.

NOTICE.

SEALED TENDERS, addressed to the undersigned and endorsed "Tender for Indian Supplies," will be received at this office up to noon of SATURDAY, 30th April, 1887, for the delivery of Indian Supplies during the fiscal year ending 30th June, 1888, consisting of Flour, Bacon, Groceries, Ammunition, Twine Oxen, Cows, Bulls, Agricultural Implements, Tools, &c., duty paid, at various points in Manitoba and the North-West Territories.

Forms of tender containing full particulars relative to the Supplies required, dates of delivery, &c., may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.

Parties may tender for each description of goods (or for any portion of each description of goods) separately or for all the goods called for in the Schedules, and the department reserves to itself the right to reject the whole or any part of a tender.

Each tender must be accompanied by an accepted Cheque on a Canadian Bank in favour of the Superintendent General of Indian Affairs for at least five per cent. of the amount of the tender, which will be forfeited if the party tendering declines to enter into a contract based on such tender when called upon to do so or if he fails to complete the work contracted for If the tender be not accepted, the cheque will be returned.

Tenderers must make up in the Money columns in the Schedule the total money value of the goods they offer to supply on their tender will not be entertained.

Each tender must, in addition to the signature of the tenderer, be signed by two sureties acceptable to the department, for the proper performance of the contract.

When implements of a particular make are mentioned it is because the articles so designated suit the department for the purpose required better than others; in such cases the competition between tenderers must, of course, be in the transportation to the place of delivery.

In all cases where transportation may be only partial by rail, contractors must make proper arrangements for supplies to be forwarded at once from railway stations to their destination in the Government Warehouse at the point of delivery.

Tenderers will please note carefully the following conditions:—

1. Supplies will not be paid for until the Department has been assured of the satisfactory delivery of each article for which payment is claimed.
2. No tender for supplies of a description different to that given in the index will be considered, and supplies which are found on delivery, to be of kind or quality different to those described, will be rejected by the agents of the department; and the contractor and his sureties will be held responsible for any loss entailed on the Department through failure to deliver in accordance with terms of contract.
3. It must be distinctly understood that supplies are to be delivered at the various points for the prices named in the tender; *that no other additional charge for packing or any other account will be entertained*, and that an invoice must accompany each separate delivery of supplies. An invoice for each separate delivery must also be sent to the Department of Indian Affairs at Ottawa, and one to the Indian Commissioner at Regina, if the supplies are for the North-West Territories. When the supplies are for points in the Manitoba Superintendency the triplicate invoice should be sent to E. McColl, Winnipeg.
4. Prices must be given for articles to be delivered at each point of delivery named in the Schedule for each article for which a tender is submitted, and not an average price for each article at all points of delivery; no tender based on a system of averages will be considered
5. Tenderers should understand that they must bear the cost, not only of sending their samples to the Department of Indian Affairs, but also freight charges incurred in returning such samples to the tenderer.
6. When supplies are to be delivered "equal to sample," tenderers should understand that the sample is to be seen either at the Department of Indian Affairs, at the office of the Indian Commissioner at Regina, at the office of the Inspector in charge at Winnipeg, or at any one of the undermentioned Indian Agencies.

LUMBER DEALERS,
TORONTO, ONTARIO,
Office No. 9 Victoria Street.

C. H. CLARK

Wholesale Dealer in
TIMBER, LATHS, LUMBER AND SHINGLES.
BARRIE, - - ONT.

TO SHIPPERS.

AN influential and well-known firm of British Timber Merchants desire to open out correspondence—with a view to permanent business relations—with some reputable lumber firm in Canada, who are doing an export business, particularly in White Pine and White Oak, with the object of securing the sole agency for the whole of the United Kingdom. The fullest justice can be done to such an agency. None but those doing a large trade and meaning business need apply. Address in first instance,
A. G. MORTIMER, Peterborough, Ont.

MINING REGULATIONS

To Govern the Disposal of

MINERAL LANDS OTHER THAN COAL LANDS,

1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron, or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting, for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode, or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron, on veins, lodes, or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mines.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provide for the character of the survey and the marks necessary to de-ignate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations the claimant shall, within sixty days thereafter, file with the local agent in the Dominion Lands Office for the district, in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt, it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operation on the same; but the claimant is required before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE cash, and the sum of FIFTY DOLLARS extra for the survey of same.

Not more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.—The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area, which shall be bounded by north and south, and east and west lines astronomically, and its breadth shall equal its length, Provided, that should any person making an application purporting to be for the purpose of mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The Regulations also provide for the manner in which land may be acquired for milling purposes, reduction works, or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1884, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect of quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The regulations apply also to

RED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS.

Contain the *forms* to be observed in the drawing up of all documents, such as:—"Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location" "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed-rock Flume Company." "Grant for Drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulation to govern the disposal of Dominion Mineral Lands, the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

WORKING CLASSES ATTENTION! We are now prepared to furnish all classes with employment at home, the whole of the time, or for their spare moments. Business new, light and profitable. Persons of either sex easily earn from 50 cents to $5.00 per evening, and a proportional sum by devoting all their time to the business. Boys and girls earn nearly as much as men. That all who see this may send their address, and test the business, we make this offer. To such as are not well satisfied we will send one dollar to pay for the trouble of writing. Full particulars and outfit free. Address GEORGE STINSON & Co., Portland, Maine.

BAND AND SCROOL SAWS.

A VERY useful tool in a pattern shop is a good band saw. The more it is used the better it is liked, and one is continually being surprised by its capabilities. It will do nearly everything that a circular saw can do, and a great many things that can't be done by a circular saw. The band saw, if kept in good order will do nice work, but if the guides are allowed to get worn out of shape, leaving the edge of saw loose, the saw so badly set and filed that each and every tooth strikes it in a new place on the stuff being sawed, and then the hole through the table so large that you can stick your finger down through the table all around the saw, it won't be likely to do very nice work, and it wouldn't be safe to get very close to the line in sawing, because you never would be sure of where the saw was cutting on the bottom side of the stuff. With a saw that is set and filed accurately, you may safely cut right up to the line, when necessary, if it don't crowd the saw, but allow it time to cut free and clean.

In sawing short curves it is very easy to cramp the saw by feeding too fast, or in the wrong direction. It is hard to give any explicit directions in regard to feeding when sawing curves, but let the feeding be so done that all the power exerted will tend to force the saw against the collar or plate behind it. You should not twist the stuff so that the saw is pressed hard against the sides of the guide, as this causes great friction and consequently throws a great strain on the saw, also heating it. If you persist in doing this you will break a great many saws, besides wearing out the guides very fast. The rubber covering on the wheels will also come in for an excessive amount of wear.

When the saw needs setting or filing, before you take it off the wheels, brush the dirt and gum out of the teeth. A file card does this first rate; then joint the saw with an emery stone, taking care to hold the stone square across the saw. Take off the saw and if it needs setting, set it just as little as possible. Don't try to make a wide saw do the work for which you should use a narrow saw by setting it very wide, for it won't work nice, and it is hard on the wheel covering. In filing, it is customary to file all from one side and square across, although the saw would cut better if filed partly from each side.

After the saw is replaced on the wheels, and the guides adjusted to the saw, not the saw made to run in the guides, just as they are, because it runs so before filing, unless both the top and bottom guides are just right to fit and hold the saw. Make sure that they are just right. They should be exactly in line with the saw, and take in the whole width of saw except the teeth. Then adjust the upper wheel. This will usually, and I presume always, be provided with means for tilting it over toward the front or back as may be necessary so that the saw won't run off. It should run against the back of the guide very lightly when not doing any work. This saves the guides and also prevents any unnecessary heating of the saw.

Now joint off both sides of the saw in this way, use an emery stone having a flat surface, then holding the stone against the side of the saw touching the back edge, first keeping it in contact with the back edge, swing it around until it touches the sides of the teeth. This method will prevent any possibility of cutting off the front corners of teeth, and therefore the saw will cut to its full width.

The saw should run straight and true when in motion and not squirm around like a snake, as I have seen some do. You can perhaps imagine how close to the line it would be advisable to get with a saw that runs back and forth sidewise, three or four times in each revolution. Of course this sidewise motion should be controlled by the guides, but the same saw that has the most need of the controlling influence of the guides doesn't get it, because the guides are in no better shape than the saw itself.

A saw that has been broken and mended a number of times is very apt to run crooked not only on account of the joints, but because the soft places which the brazing of the joints make, are very apt to get bent. When your saw gets broken and you wish to mend it, begin by filing down the ends you wish to join. Make the joint from one-half to one inch long, taking care to file the ends to a straight taper, so that the joint will fit closely together without springing and also to be of the same thickness as the rest of the saw. This is important, as you will find that if you have to spring the joint together when you braze it, you will spring the saw on each side of the joint. Then when you are ready to braze the joint, take care to clamp it down straight, and don't get more thickness of brass, silver or whatever solder you use than there will be of steel after the joint is finished. Put the saw on the machine, adjust the guides and try it. If the edge runs in a straight line, and the new joint passes the guide without being heard, you have done a good job, and you will be repaid for all your troubles by the quality of work turned off.

If I should try to tell all that might be done by a band saw I should wear out the patience of the reader, and perhaps not tell him anything new after all. The best job I ever heard of as being accomplished on a band saw was the sawing of gear teeth, right to the line, so that they only required sandpapering to complete them. I didn't see the gear teeth, but I always thought they must have been finished before the sandpaper touched them. Seriously, about the only thing in the line of sawing that can't be done on a band saw is making holes. This is where the band saw has to yield to the jig saw, its older relative. This machine (the jig saw) as in use in most shops, makes more noise than all the rest of the machinery together, and does comparatively little work. It is just the opposite with the band saw, which makes very little noise, but does a great deal of work.

There are, of course, some exceptions to the kind of jig saw noted, but even the best of them require constant care and a good deal of it. The saw wants filing very often, and why shouldn't it when you remember that about five inches in length of it does all the work, and consequently gets dull very quickly? Then the guides for the cross heads—perhaps there are two cross heads—must be kept snug, and the connecting rod or pitman mustn't be allowed to get loose, and there is usually trouble in keeping the machine oiled, as the sawdust, more or less of it (generally more) falls directly on the cross-head and pitman, and soon obsorbs the oil from these parts and from the guides. But we must put up with all their faults, because we can't saw holes with a band saw, until some genius (?) makes a band saw with a joint in it.

One great difficulty in the way of a smooth running jig saw is a little too much speed; they run too fast. If the pitman and crosshead are very heavy, and are not well balanced, you can easily see what a little too much speed will do. Then there are jig saws that are not provided with any appliance to ease the shock of reversing the motion at the end of stroke. The spring commonly used at the top to strain the saw helps the reversing at the lower end of the stroke, but hinders it at the upper end. Another point where the jig saw has the advantage of band saw is in the size of work which may be done. On the band saw the size is limited to the diameter of the wheels which carry the saw, but with the jig saw the only limit to size of stuff sawed is the size of room where the saw is located.

A good jig saw should have its crosshead and pitman as light as is consistent with the necessary strength, and well balanced, with good tension for saw at the top end. This is a sure method of holding the saw, and one that can be operated quickly. The pitman must not be too short; neither should it be too long, as this will add unnecessary weight to the reciprocating parts. Not less than three, or more than five times the length of stroke will put the length within reasonable limits. The tension spring helps the reversing at lower end of stroke. Then if the blower for removing the sawdust could be located at the top end of stroke; but the difficulty in the way of this is the pipe necessary to convey the compressed air from the blower to the upper surface of work. Still an air cushion might be utilized to keep the sawdust off the crossheads and guides, and it would certainly make the saw run steadier. Then, to bring out the good points, and make them show to the best advantage, the saw should stand on a good foundation.

It is not a good plan to use much oil on the saw, or the saw guides, because the sawdust sticks to it, and the oil gets on your work, and it makes things dirty and disagreeable. This applies equally as well to the band saw. It is much better to keep the saw in such good order that it will need no oiling at these.

I recollect reading in the *American Machinist* about the influence poor tools, dirty machines, and the poor work resulting therefrom, had upon the character of the workman. Where these things are chronic, the men's work will soon become like the shop, poor and dirty in looks, and whoever saw a dirty machine do a good job?

Take, for example, a band saw that hasn't had the oil and dirt wiped off in six months, and this too, where it has been the rule to oil the saw and saw guide as often as any one thought necessary. The oil will collect all the sawdust that will stick to it: the saw itself I should expect to find in keeping with the machine, every tooth set to a different width, and filed to a length of its own. This saw won't do good work, and the man who has the care of it won't be apt to lose much sleep on this account.—*F. W. Barrows in American Machinist.*

A new lumber tariff has been publlshed by the C. P. R. which fixes rates from Shuswap and all shipping points east of Shuswap to all points from Banff to Emerson. On the longer distances the rates in, comparison with those in force are slightly lower, but on shorter hauls rates are doubled. The new tariff is regarded with great displeasure by dealers in Calgary and by mill men in the naighborhood of Donald as calculated to destroy their trade. Calgary and Banff are deprived of all advantages from their proximity to timber, and will have to pay as much for lumber brought 150 miles as they would have to pay if it was 600 miles distant.

NOTES FROM THE MILLS.

ONTARIO.

—The Rathbun Co. has established an agency at Smith's Falls.

—Scrimgeour Bros., sash and door manufacturers, Stratford, have admitted Jas. Bennock a partner.

—The firm of Hastings & Peterkin, planing mill, Toronto, has dissolved, Wm. Hastings retiring.

—Maunder's sash, door and shingle factory at Little Britain, Ont., is being overhauled and improved.

—Mr. Ed. Bradley has been repairing his saw-mill at Kilgorie, Ont., and has put in a new engine.

—Mr. Wm. Hall, late of Stanton, has leased the Shelburne planing mills, and has commenced operations.

—Messrs. Hamilton & McGowan, of Laurel, Ont., have moved their saw-mill to lot 26, con. 5, Amaranth.

—Messrs. John and Thomas Cross, of Chesley, Ont., have purchased Gardner's saw mill at Dobbington, Ont.

—One million feet of oak lumber on Walpole Island has been purchased by the St. Clair steamship company.

—The estimated cut of logs for Mr. J. R. Booth, in the Nipissing District this season is put down at 174,000.

—Lewis and Hiram Vanest have purchased from W. Estis one half interest in the saw and feed crushing mills at Parkham, Ont.

—Pocock & Haynes, sawmakers, recently of Hamilton, have been voted a bonus of $5,000 to establish their works at Oshawa.

—Work on the new steamer to be constructed at the Rathbun Company shipyard will be commenced in the course of a few weeks.

—Mr. John N. Stewart, an old resident of Ashton, Ont., has removed to Eastman's Springs, where he has purchased a valuable mill.

—The bulkheads and booms at the Chaudiere, protecting the saw mills and slides, have been completely repaired in anticipation of the spring floods.

Messrs. Gilmour & Co., in addition to other improvements, have built a fine new saw mill at Chelsea, and will soon be ready to begin the season's sawing.

—A gang of 28 shantymen were recently sent to the Georgian Bay lumbering district by the Grand Trunk railway to work on the drive and in the mills.

—The Kingston and Pembroke Iron and Mining company, with a capital of $5,000,000, has been formed to develop the iron ore district along the K. & P. Ry.

—Messrs. J. R. Booth & Co., of Canada, shipped in one week recently over one hundred and fifty car loads of lumber to various points in the Eastern States.

—The Terra Cotta Lumber Company are making preparations for the erection of extensive buiklings, &c., in the so-called hospital field in the east end of Deseronto.

—Messrs. Perley & Pattee, lumber merchants of Ottawa, have extended their docks around Blyth's Point on the Ottawa river. The extension entailed great labor and expense.

—Mr. D. McLeod, of Marsden, Ont., got out about 20,000 ties and a large quantity of birch this year. Morrison & Co., of the same place, expect to have their saw mill running soon.

—The Ontario Lumber Company are making extensive shipments of lumber from Burk's Falls this spring. They have hundreds of thousands of feet piled in the station yard awaiting cars.

—Says the Orillia *Packet*, lumbermen agree that the shanties will yield a very good average cut this spring as the result of the winter's work, notwithstanding the prolonged and severely bad weather.

—The new Paper Pulp Company, at Ottawa. have a large gang of men employed in fixing up the old Thompson mill on the Chaudiere. The old driving water-wheels are being removed and heavy iron ones put in their place.

—Mr. John Ellison, of Port Stanley, has been granted a bonus of $6,000 by that town on account of the wood bending and turning works which he is erecting there. It is expected that these works will be in operation about April 1st.

—Mr. James, of Pickering, Ont., is opening a large lumber yard in Toronto. He has 25 men at work near Gambridge, Ont., getting out cedar for fence posts, paving blocks, etc., for shipment via the Midland railway to this city.

—One of the largest turbine wheels ever imported into Canada passed through Ottawa last month. It was purchased in Holyoke, Mass., by the Du Lievre Milling and Manufacturing Co., and will be utilized in increasing the power of their phosphate crushing mill at the Du Lievre Basin.

—Mr. J. Dovey has arranged to at once build at Lindsay a large shingle mill. The site selected is on the east side of the river, where the Thurston mill stood some years ago. The mill is expected to be in operation by the end of May.

—A consignment of sixteen car loads of laths was shipped the other day to the New England states by Messrs. Bronson, Weston and Dunham, lumbermen of the Chaudiere. The shipments of laths to the other side this spring have been large.

—Messrs. Fox & Co., Toronto, manufacturers and dealers in lumber, sash, doors, blinds, etc., inform us that an unusual amount of building in Toronto is in contemplation for the coming season, and that nothing short of an earthquake or a strike among the building trades, which terms are synonymous, can retard or prevent the boom.

—The splendid new iron tug which the Upper Ottawa Towing Company is building at Pembroke is fast nearing completion and will be ready for launching when the ice goes off the river. After the engine and boilers are placed she will be taken to the Lower Allumette lake by way of the Culbute canal, to engage in the season's towing.

—Mr. W. P. Sweatman, for many years manager of the lumber firm of Messrs. A. & P. White, at Pembroke, is leaving with his family to enter the service of the celebrated Massey Mfg. company at Winnipeg. He was presented recently with a handsome silver tea service and a most feeling address by the congregation of Holy Trinity Church at that place. The workingmen also presented him with an address and a gold chain and locket, also a case of silver dinner knives. A deputation of clergymen waited upon him, presenting a beautiful address and valuable present of books as a recognition of their appreciation of his untiring and faithful labors in all good works.

—Messrs. Train & Son are thoroughly overhauling the saw mill at Burk's Falls. The building is being enlarged by the addition of 30 ft. in length, and 10 ft. in width along the whole structure, making the mill to cover 40x100 ft., thus affording an increased power of 4 ft. head, and bringing the two Leffell Wheels nearer their work. They are also putting in a new saw rig and carriage, independent rope feed, trimmers, burner, slush chains and live rolls. This is being supplied by the well known firm of The William Hamilton Manufacturing Company, of Peterborough. The drag saw, shingle machine and lath cutter have been removed to the mill floor for convenience of the workmen and oversight. This mill when completed will cut 30,000 ft. per diem of lumber, and about 25,000 shingles. The firm have now about two and a half million feet to cut, and are arranging for an additional amount. Cutting will begin about the 15th of May, when 25 or 30 hands will be employed. Mr. W. H. Train has the general management of the work at Burk's Falls.

QUEBEC.

—A gentleman, who has recently arrived from River Desert on the Gatineau, states that the roads to the lumber shanties are now impassable by teams, and that it is impossible to take provisions to the shanties.

—An immense iron gang for cutting lumber, with a 54 inch sash, and taking saws 3 feet 8 inches long, weighing in all about 25 tons, was loaded the other day for shipment to the Charlemagne Lumber Co., below Montreal. This monster machine, was made at the Wm. Hamilton Manufacturing Company's Works, at Peterboro' Ont., whose invention it is.

—Messrs. James MacLaren, of Buckingham, lumber manufacturer; Albrech T. Pagenstether, of the city of New York, merchant; Warren Curtis, of Corinth, state of New York, paper manufacturer; John Edward Doyle, and John Forman, of Montreal, merchants; will apply to the Quebec Legislature to be incorporated as the Laurentides Pulp Company (Limited), with a capital of $200,000. A factory is proposed to be built in Montreal.

—*L'Electeur* defends the Mercier Government's action in increasing from two dollars to five dollars the ground rent payable by lumber merchants on their timber limits. It does so on the ground:—1. That the Government requires $125,000 a year additional revenue to put an end to deficits and meet the interest on the new loan. 2. That for twenty years owing to the low rent, the lumber merchants have been gradually getting into their hands all the best timber lands to the detriment of the settlers, and holding them, not so much to work them as to sell them on the first chance at enormous profits, paying little or no stumpage, and thus robbing the Province of the revenue which it has a right to expect from its forest resources. 3. That it is desirable to protect these resources against speculation; and 4. That it is time the lumber merchants should contribute their proper share of the revenue, and that all the public burdens should not fall on the people. *L'Electeur* adds that there are actually 4,000 square miles under license, and that the increase from $2 to $5 per acre will yield an additional revenue of about $138,000.

—Commencing this date the extensive lumbering and manufacturing business so long conducted by Mr. E. B. Eddy, with headquarters at Hull, becomes merged into and will be conducted as a company. Mr. Eddy remains at the head of the concern, with Mr. S. S. Cushman (long connected with the establishment) as vice-president, and Mr. W. H. Rowley, formerly manager of the Merchants' Bank, as secretary-treasurer. The company is incorporated by Act of Parliament, and starts out with a capital of a million and a half. The business, which has now assumed very extensive proportions, was established in 1854, just thirty-three years ago. The house has always enjoyed a first-class reputation for business enterprise and integrity, and in its new relationship will doubtless hold the valuable connections already established throughout Canada, the United States and abroad.—*Ottawa Journal.*

NEW BRUNSWICK.

—Spruce logs are worth $9.25 for American, $8 for Canadian.

—Freights to New York by water are $3 to load above Suspension Bridge, $2.75 below.

—Miller & Woodman's and A. Cushing & Co's mills commenced sawing on the 21st March.

—The ice in the St. John River and lakes is not heavy and there is every prospect of good driving.

—Operations in the woods are done. The cut is probably one fifth short, as the great depth of snow prevented anything like good work.

—Mr. Jordan foreman for Hayford & Stetson will build a shingle and rotary mill on the site of the Warner mill destroyed by fire in December last.

—Hayford & Stetson have built during the winter seven lime kilns close to their Indian Town saw mill, which they propose to fire with their refuse.

—The annual meeting of the St. John River Log Driving Company will be held in the city of Fredericton on the 20th April. The driving rights and duties will be sold at public auction the same day to the lowest bidder.

—The St. Croix, (N.B.) *Courier* says the authorities of the United States have sent men to the upper waters of the St. Croix and Saint John rivers to take account of marks and the quantity of logs got out on American soil with a view of stopping the alleged smuggling of Canadian lumber into Maine ports.

—Advices from St. John's, N.B., states that the cut of logs on the St. Croix river the past winter, was intended to be about 50,000,000 feet, but in reality it will not amount to more than 30,000,000 feet, or less than half of last year's cut. An early break-up of the ice in the streams is anticipated, and driving operations are likely to be very successful.

—A Springfield correspondent of the St. John, N. B., *Sun* writes: "Chas. Perkins, of Norton, has given employment to quite a large number of men. He has now under his employ some 22 men. During the winter he has got out some 150 cords of pulp, which is now at Norton station ready to ship to the contractors in the United States. He is now getting lath wood, and expects to ship some 100,000. He says the winter in our country has been very favorable for his business."

MANITOBA AND THE NORTH-WEST.

—The Minnesota & Ontario Lumber Co., of Rat Portage, have sent men to the mountains to examine the timber limit which the company purchased there recently.

—The contract for supplying tamarac poles for the telegraph line between Battleford and Clarke's Crossing has been awarded to Mr. Tupper, of Victoria; and for the line between Clarke's Crossing and Humboldt to Baptiste Boyer.

—Winnipeg *Free Press:* The winter's cut in the lumber regions of Lake of the Woods will amount to about 32,000,000 feet. The Keewatin Lumber and Manufacturing Co. have had five camps established all winter, and will get out twelve million feet saw logs and 150,000 ties. Some 30 million feet of logs are reported. Immense quantities of ties have been taken out this winter. A Selkirk estimate of the lumber which will be brought in from Lake Winnipeg during the coming summer is:—Wood & Co., one million feet; Brown, Rutherford and Neilson, fifteen hundred thousand feet; Selkirk Lumber Company, four million; Captain Robinson, two million; Drake & Rutherford, two million; Jonasson, Frederickson and Walkley, fifteen hundred thousand; J. Woods, one million, an aggregate of fifteen millions. Apart from this J. Woods will bring in fifteen hundred thousand shingles, and Messrs. Howell & Scarry about 50,000 railway ties. This would make the total lumber output for the winter about 45,000,000 feet—probably an outside estimate. There is, however, no doubt but that the output this year is considerably in advance of previous years, and the prospects for the summer business are fairly bright.

A STANDARD GANG SAW MILL.

WE noted in our last issue that the Wm. Hamilton Mfg. Co. of Peterborough, Ont., had just made arrangements with Wm. M. Wilkin, of Erie, Pa., to manufacture his improved patent Compensating Balance Gang, and now give description and cut which very clearly shows its general construction and operation. The radical departure in this machine from previous practice consists in the device adopted for preventing the excessive vibrations to which the ordinary gang mill has been subject. The immense weight of a heavy sash full of saws, reciprocating at the rate of 200 to 300 strokes a minute required an absolutely stable foundation ; and even then many gangs tore themselves to pieces.

The shaft of the compensating gang here illustrated is provided with three cranks, the centre one operating the main pitman and the sash. The other two carry inverted pitmans attached to a counterweight sliding in vertical ways. The counterweight is exactly equal to the sash and its saws. The three cranks have the same throw, the two inverted pitmans are of the same weight as the driving pitman, and as the motions of the sash and the counterweight are in exactly opposite directions, it will be seen that the reciprocating parts are self-balanced, the opposing shocks and vibrations will thoroughly neutralize each other, and the machine will run at any speed without jar. Such are, in brief, the claims of its makers. Moreover, it will be seen that the vertical throw of the mechanism being absorbed within itself, the journal boxes are required to bear only the uniform weight of the sash, rods and counterweight.

The sash is made of one casting of steel, and is oscillated by long inverted pendulums pivoted at the bottom, and oscillated near the top by means of an eccentric rod and rock-shaft, so timed with reference to the stroke that the saws enter the cut without shock, leave it when stroke is complete and rise clear of the log, being again thrown into action near the top of the down stroke. The feed is continuous, and variable at the will of the operator.

In the machine shown the rolls open high enough to take in a 14 inch cant 32 inches wide, or the rolls may be filled with several smaller cants or "flitches," piled in tiers, so that flooring may be rapidly made. The ordinary feed carried is ¼ inch per revolution of shaft, and the number of revolutions per minute is 300. The saws are held by tabs and buckles keyed at the top. They may be placed any distance apart for making lumber of any desired thickness by the insertion of guage blocks between the buckles. The capacity claimed for this gang is about 40,000 feet of inch boards a day, with but one attendant aside from the saw filer.

LATEST NEWS NOTES.

Messrs. Sherwin & Kelly, Allanwick, have started a shingle mill at that place.

Winnipeg, Manitoba, done a business in lumber last year amounting to $1,342,000.

The Rat Portage *News* reports that the Keewatin Lumber Co. will open a yard at Winnipeg.

Carswell, Thistle & Mackay, Calabogie, expect to cut 8,000,000 feet of lumber this season.

Alpena, Mich., parties are reported to have recently sold 1,000,000 feet of lumber to Buffalo parties at $8.50, $17 and $37.

Mr. H. T. Pierce, of Martinville, is now associated with the management of the Flint Saw Mills at Three Lakes Quebec. This concern will now manufacture bobbins and spools in the rough for Messrs. Thompson & Co., Sherbrooke.

The Eliza Cook, lumber laden, from Halifax, N. S., for Bermuda, encountered bad weather April 2nd, in which she lost her deck load of lumber, and subsequently became a total wreck. The crew were rescued by the steamer Concordia, of Glasgow, the hulk and cargo being abandoned.

Messrs. McLachlin Bros. of Arnprior, are said to be contemplating the erection of a railway from their Pettewawa limits to the Madawaska, in order that they may have more rapid carriage of their lumber, under their own control, and free from the annoying delay of towing down the Ottawa.

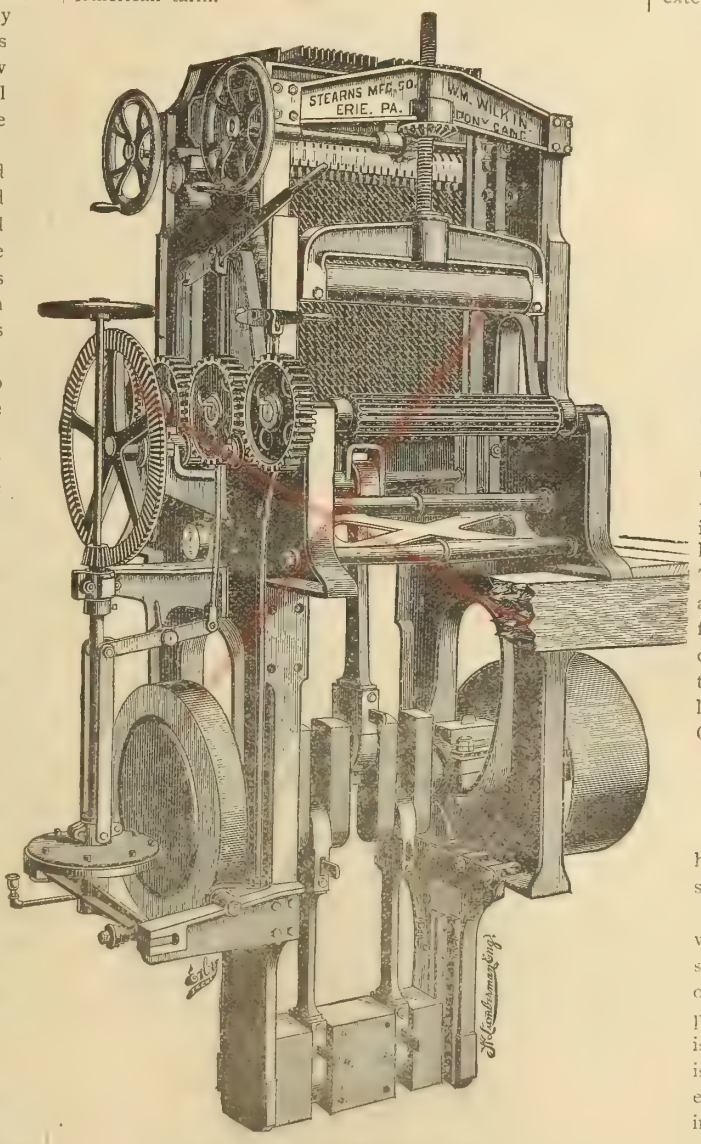
When the south extension of the Algoma branch of the Canadian Pacific railway is finished, it will be easier than now for Michigan lumbermen to reach the pine forests on the Serpent, Spanish and French rivers, for then they can go by the way of Mackinaw and the Sault instead of Toronto.

According to the Halifax *Herald* quite an extensive business has been done at Minudie and River Hebert, N.S., in lumbering and piling. The vessels at both places are putting on their cargoes and preparing for loading, but the depression occasioned by St. John failures has seriously affected the deal trade.

The following tariff of tolls to be charged by the Rouge Boom Company during the season of 1887 has been approved: Pine logs 3 cts. each, spruce logs, 2 cts., long, round or flat timber 5 cts., square timber 10 cts. Railway ties 1 cent. A duty of 10 per cent. *ad valorem* has been imposed upon molded celluloid balls and cylinders, coated with tinfoil or not, but not finished or further manufactured.

The lumbermen at the Chaudiere state that no difficulty will be experienced by them in securing the required number of hands to work in the mills during the summer. The wages will be the same as last summer from $1.20 to $2.75 per day. Most of the firms regulate the pay of their hands according to the success of the season. If a season is unusually good the pay of the men is raised 25 or 50 cents a day as the case may be.

Chaudiere lumbermen have been apprized of the fact that two or three wealthy Michigan lumber companies which own large quanities of Pine in Ontario will import a considerable quantity during this year, notwithstanding the Canadian export duty. A single raft of 3,000,000 feet was put together in Georgian Bay last autumn, and will be started for Saginaw on the opening of navigation. The Dominion tax will, it is said, be removed whenever lumber is put on the free list of the American tariff.



THE STANDARD GANG SAW MILL.

The projectors and builders of the great Joggins log raft that came to such an ignominious end last summer are again at work rebuilding the monster, and instead of curtailing its dimensions are making it 200 feet longer. Mr. Robinson, the designer and constructor, is confident of success at the next trial, and as the unsuccessful past will give experience for the future, it is thought not unlikely the next launch will have a successful termination. The saving of freight on the immense mass of logs and timber will be very considerable, in fact it amounts to a moderate fortune.

Messrs. Smith & Sutwell, of Thornbury, Ont., have for some time past been negotiating with Mr. J. Ferguson and the Ontario Government, to secure a site for a saw and planing mill, sash and door factory at North Bay, and arrangements are about completed satisfactorily. They will also open a local market for all the hardwood timber such as birch and maple that can be furnished, as the quantity of pine which they will secure from the Government will be limited, and in order to keep the mills going the whole season a larger quantity of hardwood would be required than the sett'lers at present in the township of Shadowfield can furnish.

The New Brunswick Trading Co., says the Miramichi *Advance*, is removing its head office to Black Brook, but will also continue to occupy a town office. The company has added a fine new building to its already large share of Black Brook village, which is fitted up as a counting-room, store, etc. Preparations are being made at the mill for the coming season's sawing, and the indications are that the company intend to push business as usual notwithstanding the reverses of firms lately connected with it in an indirect way.

Lumber operations at Fisher River, Man., [illegible] a correspondent :—The lumber camps are breaking up for the season. C. W. Bubar finished last Saturday and started for Selkirk on last Monday morning to bring in supplies and men for the summer. He has had a successful winter's work. Messrs. Brown, Rutherford & Neilson's teams will start for Winnipeg on Monday, the 9th inst. They have taken out an excellent stock of logs this season. They are the largest average I have ever seen in any camp during any season on this lake. The Selkirk Lumber Company have still two teams at work, but will soon be breaking camp also. They have the largest cut of any on the lake, having about 60,000 logs.

The lumbering interests of [illegible] extensive and the equipments complete. [illegible] which has both circular and gang [illegible] 350,000 feet of lumber every ten hours, and is driven by an engine of 1,500 horse power, with sixteen boilers. The timber mill turns out 50,000 feet of ordered stuff for builders, and the shingle mill equipped with the best machinery, cuts 125,000 shingles per day by means of a 250 horse engine. Five hundred men are employed in these mills. A line of railway runs the entire length of the firm's property, through its lumber yard. These yards have storage capacity for 40,000,000 feet of lumber. The planing mill is run by water power. At present it has four modern planers and there is room in the building for five more. The mill has a capacity for planing 80,000 feet of lumber per day. Connected with the mills is a complete fire system. A commodious brick fire shed has been erected at the water's edge, between the two largest mills, with stables, engine room and quarters for the 25 men who constitute the fire company. They have charge of an Amoskeag steam fire engine. Then there is a force pump in the engine house connected with a 12 inch pipe which leads around the different mills and through the yards. This pump can throw 15,000 gallons per minute. There are 10 hydrants outside the mills and 18 inside. An electric fire system, 16 bells, connects the several principal parts of the yard with the fire department. At the head waters of the Moira and Otonabee rivers there are extensive timber limits. The Central Ontario Railway also taps one of Gilmour & Company's limits.

HOW TO CLEAT LUMBER.

Something may be said as to the advisability of cleating hardwood lumber, especially ash, oak and hickory, when sawed rough edged.

Cleating is beneficial if done at the proper [illegible] when the plank comes from the saw and before it has [illegible] split by handling. After a split has opened a plank [illegible] or three feet, a cleat cannot be put on securely enough to prevent the split from extending the first time the plank is handled or "dumped" from a truck. The proper way is for the mill hands or foreman to select the planks, generally the ones coming from the center of the log, that indicate by their appearance a tendency, by small checks or free, straight grain, to be liable to split [illegible] whole length of the plank, and at once nail on a cleat of tough, strong wood. Oak or elm is best.

Care should be taken that the cleat does not extend over the edges of the plant or lap over the sides so as to be easily pulled off in handling, or take up extra room in stowing is shipped where freight is charged by the cubic foot instead of board measure. Plenty of nails should be used. For two inch plank, the cleats should be ¾ inch thick and 6d or 8d nails used. Nailing on strips of laths is only a waste of time and material.

Ash splits more readily than any other plank, and the better the quality and the freer from defects, the easier it splits.

Inspectors usually take this fact into consideration : and if a plank is otherwise perfect, will measure down in width one or two inches, and grade it as firsts when it would be classed as seconds if ordinary square edged plank. Most of the best ash, oak and hickory is used for carriage material, and consequently cut into small and short pieces, and the quality is more important than the width and length. In such kinds of lumber, knots are a much more serious defect than splits. Cleats will help much to prevent the latter if put on as suggested.—*New York Lumber Trade Journal*.

The Canada Lumberman

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

PUBLISHED MONTHLY BY

A. G. MORTIMER, PETERBOROUGH, ONT.

Terms of Subscription :

One copy, one year, in advance $1 00
One copy, six months, in advance 0 50

Advertising rates furnished on application.

All communications, orders and remittances should be addressed and made payable to A. G. MORTIMER, Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of pub ication at least six clear days before the day of publication to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co , 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, ONT., MAY, 1887.

NEW MARKETS.

THE passage of the Retaliation Bill by the United States, makes it possible, though not very probable, that the chief foreign market for our lumber may be closed against us. This possibly, makes additionally necessary what was already highly expedient, that we should extend or open new markets. This as a matter concerning our commerce is especially with the jurisdiction of the Dominion authorities. As the Parliament of Canada is now in session the Government should be urged to take such steps as may assist in bringing about the desired result.

Among the markets which force themselves upon attention as being easily accessible, important and capable of receiving far more largely from us, the foremost in all these respects is the West Indies. We already export to them the products of our forests but the amount is by no means what it ought to be, or what it might be made. The great share of this trade is enjoyed by our neighbors of the United States, though Canada is as well situated for conducting it and is as well endowed with the supplies required by the islanders. Indeed it is certain that much of the export to the West Indies from the ports of the United States consists of Canadian lumber. There is no reason why we should allow our neighbors to be middlemen and to deprive us of much of the profit of a commerce which we could quite as well conduct at first hand. We ought to be able to extend our supplies to the West Indies by replacing to a considerable extent the lumber sent there from the Northwestern States. It must be remembered also that a large proportion of the exports to this market consist of goods in a more highly manufactured condition than mere lumber, such as sashes, doors, &c. Thus the extension of this trade is a matter of importance, not only to our owners of timber limits and sawmills, but also to our numerous planing mills and kindred industries. One circumstance that facilitates the extension of this trade is the fact that Canada is receiving large quantities of raw sugar from the islands, and the vessels bringing it are seeking return cargoes. Why should they not be afforded by the products of our forests, the freights for which would thus be made reasonable?

Another important market which is attracting more attention of late is that of the Australian colonies. They have an abundance of excellent hardwoods, but are deficient in pine and kindred timber. Their imports in this line are consequently large and are mainly drawn from the United States and Europe, much from England having been first imported by that country from Norway or Russia. Now British Columbia should be able to compete advantageously for this trade with the Pacific Coast of the United States, and other parts of Canada must be at least as well situated for it as England or other European countries. The proposed great Australian exhibition would afford an opportunity for making a display of the produce of our Canadian forest, which should not be neglected.

There are other available markets which either have not been tried at all or have not been adequately tested.

The Canadian authorities should be urged to make renewed and greater efforts to open these markets. But they can only aid, and it is upon the exertions of enterprising men of the trade that the chief dependance must be placed.

A LUMBER ORGANIZATION.

WE have on several previous occasions referred to the necessity existing for the formation of some organization calculated to benefit the lumbermen, and from which both the large and small operators would be equally benefitted. In the past organization among lumbermen has received but little attention. Even among the largest dealers the opinion seemed to exist that mutual assistance was not required. Every man wanted to lay out his own plans, and keep his system as much as possible from his neighbors. This feeling of independence, however, is giving way, and to-day there are lumber exchanges, or similar organizations, in most of the prominent markets. At a meeting held in Toronto during the past month, at which many of the representative lumbermen were in attendance, the question of forming a trade branch or lumber section of the Toronto Board of Trade was discussed. The chair was occupied by Mr. A. H. Campbell, of Toronto. By invitation Mr. Henry W. Darling, Ex-President of the Board of Trade, and Mr. Willis, Secretary, were present. Mr. Darling explained the method of organization, and also set forth the advantages to be gained by connection with the Board. The meeting resulted in a unanimous expression in favor of taking advantage of the facilities offered by the Board. Messrs. A.H. Campbell, of Toronto ; David Gilmour, Trenton ; J. L. Barton, Barrie; and Jas. M. Irwin, Peterborough, were appointed a committee to prepare an address to the Council for permission to organize and also to prepare the necessary by-laws.

It is indeed satisfactory to know that at last there is a prospect of bringing the lumbermen into closer business (and social) relations with each other, a step which must undoubtedly have a tendency towards bettering the condition of this extensive industry, but the question may arise in the minds of some of our readers, as it has to us, whether or not an alliance with the Board of Trade is going to have the beneficial results that most of those who are taking the initiative in this matter imagine. By introducing this question we have no intention of casting a reflection on the workings of the Toronto Board of Trade. On the contrary we believe it is a very necessary institution and is doing a good work, but we think it possible to overdo almost everything, and on these grounds we are of the opinion that an entirely separate organization would result in more work and far more satisfactory results. While possessing a large amount of influence, which if properly used in the interest of any branch of trade, this Board could be of incalculable service, but when its interests are so varied, intricacies arise which often tend to injure one or other of the industries represented. This has been the experience of other representative industries, and we much fear that should the lumbermen ally themselves to this body that in the no distant future our forecast may be found to be true. To more fully explain our argument we mean that the Toronto Board of Trade has already assumed more work than it can successfully carry out, and in consequence some one must suffer. The man who attempts to carry on a dozen different branches of trade usually goes to the wall, but he who centers his mind on one object is the man who, generally speaking, winds up with a good bank account and reputation. What is good for an individual, applies also to the largest industry of the country, therefore we say let the lumbermen have a separate organization, look after their own interests without depending upon disinterested parties to do it for them, and with the extensive influence they can bring to bear, the organization will be a success and they can claim credit to themselves alone.

OUR TIMBER LANDS.

THE suggestion that a map should be prepared by the Ontario Department of Crown Lands showing not only the timber limits now under license, but also those still unappropriated, is one that should not be lightly rejected, for the adoption of it gives promise of great usefullness. The Ontario Administration would do well to consider whether the objections it saw to complying with this request are of sufficient moment to be prohibitory. On second thought they may probably admit that their main objection, namely the expense, is hardly sufficient. Even if it were to cost $10,000, a hasty estimate which is probably largely excessive, that sum would be well expended in affording such valuable information. It could hardly fail to bring into the Provincial treasury an amount of money that would far more than compensate for the expenditure, besides its other advantages.

To the lumbermen it would be very useful to have such an authoritative indication, not only of the extent of timber limits that are already appropriated, but also of that area that remains available, with the localities in which it is situated. This information could hardly fail to stimulate their biddings and to produce an effect in augmented receipts at the next sale of timber limits that would be most satisfactory to the Provincial Treasurer.

It would obviously be most useful, nay it is indispensable, that the Province should know as nearly as possible what amount of this class of property it possesses. By such means it would be better able to form an idea of the extent of its resourses and their probable duration, while it would at the same time be enabled more intelligently to turn them to advantage. It would be well, too, that the whole community should be better informed as to the quantity of timbered lands still remaining.

The Province of Quebec could, without much difficulty, be induced to follow the good example. The other Provinces of Canada, and the Dominion authorities for Manitoba and the Territories, might be expected to fall into line, and then there would be presented at least an approximate idea of our existing forest wealth, and the period within which it would be exhausted. These maps might by degrees be rendered more complete as information was obtained as to the quantity and kinds of timber on the different areas. Already there must be much of such material available in the field notes of the Provincial Land Surveyors who have been engaged in laying out townships, &c. Such information, even though imperfect, would be of immense assistance to lumbermen wishing to extend their operations. Of course it would not supercede that personal inspection which must always precede a purchase, but it would at least indicate the likely locality in which to institute the search. The knowledge also of the limited amount of timber left in certain localities would have a beneficial tendency in promoting economy in the operations of the lumbermen. Even the best informed are apt to exaggerate an imperfectly known quantity and to assume without sufficient reflection that large resources are practically inexhaustible.

There would be another advantage in such maps, that they would encourage the adoption of the system of not opening forest areas for settlement, while better lands for agricultural purposes are available. It is no kindness to the agricultural settler to set him to grow wheat on land far better fitted to produce timber, while it has a prejudicial effect upon lumbering operations. Oftentimes a lumberman is hurried on to cut in some portions of his limits through fear of the consequences of settlement, when otherwise he would not have been so hasty in his operations.

By all means let us have these maps, for they will well repay the cost and trouble of producing them.

EDITORIAL COMMENTS.

THE Government has decided to reimpose, for the coming season, on the St. Lawrence canals, the same tolls that prevailed in 1885 and 1886, viz., two cents per ton.

ATTENTION is directed to the new advertisement of Mr. Peter Hay, of the Galt Machine Knife Works, which will be found on another page of this issue. Those of our readers who are at any time in need of machine knives should remember that no better article is turned out than that furnished from the Galt works.

THE *Official Gazette* of a fortnight since, contained an order-in-council to the effect that clause No. 2 of the timber regulations of 1868, for the Province of Quebec, which established a uniform ground rent of $2 per square mile for each mile under license for cutting timber is modified, and the imposition of a fixed rent of $5 per square mile for cutting timber is substituted therefor.

THE PATENT REVIEW, a neat and tidy little paper, devoted exclusively to matters affecting patents, has recently made its appearance in Ottawa. Mr. A. Harvey, C. E., is the publisher, and from the amount of energy he has already shown in its arrangement we have good reason to believe that the venture will be a success. The public at large are more or less interested in a journal of this discription and should extend it a liberal support.

MATTER for publication in THE LUMBERMAN to be in time for any specified issue, should reach us not later than the 20th of the month. If something of importance is to reach us later than that date we should have notice of it, so as to make our calculations accordingly. We trust our correspondents will make a note of this. Changes of advertisements must be in by the 22nd of the month to insure attention, and new advertisements not later than the 24th.

WE have to thank our contemporaries throughout Canada and the United States for the many kindly greetings extended the LUMBERMAN during the past few months, as also the kind words of encouragement which daily reach us from subscribers from all over the country. We are not so far above flattery that we can fail to appreciate such expressions of good-will, and shall continue to do all in our power to merit a continuance of the good opinions of our readers.

SAULT STE. MARIE people are delighted in the anticipation of an unusual boom this year. Two great American trunk railroads are to be built to that point from the west, and two from the Canadian side. The Hay lake channel is to be deepened, and the canal enlarged for vessels of heavy tonnage. Building operations will be carried on with great vigor and real estate is going up rapidly. From present indications the "Soo" is likely to become a place of no mean importance.

AN unusual amount of changes and improvements are going on this spring amoung the saw mills, which of itself indicates that the lumber trade is prospering. New mills are being erected in different parts of the country, while many others are being overhauled and the latest improved machinery added. In this, as in all other branches of trade, operators are continually tearing down and building, in order to keep pace with the demands of the trade, and as a consequence manufacturers of the latest style of machinery are reaping a harvest.

ONE evil effect of the proposed enormous ground rents of Quebec timber limits is that it would drive the limit owners to strip them as speedily as possible, so as to free themselves quickly from the heavy rent. This would for the moment help to fill the Quebec treasury through an artificial influx of anticipated income, but this would be no gain as it will only be robbing the revenue of future years of the receipts that would naturally accrue then. It would be equivalent to the case of a tenant for life, or for a term "wasting" the timber on the property

NOTWITHSTANDING the very sensational reports concerning the financial crisis in New Brunswick, which have been published in Canadian and American papers, it is now evident that the state of affairs is not by any means as serious as was at first generally supposed. The after results of the failure of the Maritime Bank, the private bank of McLennan & Co., the lumber firms of Stewart Bros. and Geo. McLeod, while certainly affecting to a greater or less extent the operations of other firms, did not result nearly as disastrous as the public at first imagined. Confidence is now being restored, and it is not probable that further failures of any importance will occur.

FROM the Trade and Navigation returns for the last fiscal year we learn that the amount of export duties collected on saw logs &c., was $20,726.07. Of this $2,869.46 was on pine logs, $17,585.11 on spruce logs, and $271.50 on shingle bolts. This is an improvement on preceding years, but it can hardly be supposed that the duty was very closely collected especially on pine logs or the sum would be larger. This was before the increase of the duty, which will make an increase for the current year. Every effort should be made to collect these duties in all cases, so as to protect our lumbermen and mill owners from the unfair competition of our neighbors.

THE pine forests of Michigan are getting played out. Although lumbering is carried on to a large extent there is not nearly as much timber exported as ten years ago. Indiscriminate chopping has done its work. The men would cut a sapling down rather than run a log around it. No thought was given to the future, and now the lumbermen have to be content with timber that a few years ago they would not have thought worth cutting. The result of the havoc which the men played among the young trees is that the State Legislature is being petitioned to pass a Forestry Act making it unlawful to cut down trees under a certain thickness.

WE take pleasure in drawing attention to the full page display in this issue of the Canadian Rubber Co., of Montreal and Toronto. This extensive company recently made large additions to their factory, and are about increasing their already large capital of $1,000,000 to double that sum, in order to more fully keep pace with their rapidly growing trade from every point throughout the Dominion. The many friends of Mr. Walker, manager of the Toronto branch, will be pleased to learn that he has fully recovered from his recent severe illness, and is again in his old quarters, better than ever prepared to attend to the wants of his customers.

AN idea of the magnitude and relative importance of the timber trade industries of Canada may be obtained from the Trade and Navigation tables for the last financial year. The exports of "Produce of the Forest" amounted to the enormous sum of $22,865,087. This ranks in almost the foremost place, "Animals and their Products" coming first with $23,077,513, "Agricultural Products" being next with $21,441,817. And in the amount thus given for forest products is not included carts and carriages $25,992, ships $266,363, furniture, doors, sashes and other manufactures of wood $685,466, besides other items. Thus it will be seen that as regards the value of their export the timber trades stand first among the industries of the Dominion.

THERE are expressions of discontent in British Columb and a portion of the Northwest Territories in regard to th freights charged for the carriage of lumber by the C. P. I Hitherto the C. P. R. has earned a favorable reputation f reasonable freights, and it should take care not to forfeit i good character in this respect. Its monopoly of transport ca only be endured through its acting fairly and even liberally such matters. It is also for its own permanent advantage th it should aid in building up the country from which it mu seek its customers if such a gigantic undertaking is to pro lastingly and progressively remunerative. The C. P. R. shou carefully revise its rates for lumber, so as to remove any occ sion for discontent. By a liberal policy it will best serve its own interests as well as those of the trade and of the public.

BUT few names in Canada are more familiar to the general public than that of Mr. E. B. Eddy—the great match man—who first established himself at Hull, Que., in 1854. He has of late years been among the heaviest lumber operators in Canada, in addition to which his extensive wood-working establishment is acknowledged to be one of the largest on the continent. During the past month we have been made acquainted with a change in name, Mr. Eddy having associated with himself a number of other gentlemen of capital and standing, who have formed themselves into what will hereafter be known as the "E. B. Eddy Manufacturing Co., Limited," a body corporate duly incorporated by an Act of Parliament, with a capital of one and a half million dollars. Mr. Eddy has been elected President of the company and also Managing Director; Mr. S. S. Cushman is the Vice-President, and Mr. W. H. Rowley, Secretary-Treasurer.

FROM the official report of the Commissioner of Crown Lands of the Province of Quebec, for the twelve months ending 30th June, 1886, we find that the total revenue for that period was $630,475.82, made up as follows: Of the lands specially designated Crown Lands, there were 99,019 acres sold for the price of $45,851.27; and the sum of $52,450.35 was collected on account of these sales, and those of previous years; $46,252.10 being derived from sales of land for agricultural purposes, and $6,198.25 from those of mineral lands. The revenue derived from timber dues, ground rents, bonus, etc., is given as $528,574.80. The result of the transactions of the Department of Crown Lands for the twelve months as stated above, is almost the same as that obtained in the preceding fiscal year. The figures show a slight decrease, but this is attributed to the fact that during this last period no extraordinary sale of either timber limits or mining locations took place, while in the year 1884-5, a sum of $68,145.41 was derived from a very important sale of timber limits.

WE have before us parts VI and VII of "Architectural Studies," just issued by Wm. T. Comstock, of New York. The first of these is devoted to small and low-priced country houses, giving among them a number of designs that can be executed for $1,000 or less. One is impressed, in looking over these designs, at seeing how much a little good taste can do for the improvement of houses where only a small sum of money is to be expended. The second of the two, part VII, is devoted to the interiors of moderate-cost houses, giving a large number of examples of window finish, wainscoting, window seats, staircases, hall and library finish, book shelves, china closets, mantels, bath room fittings, with full working details drawn to large scale, carrying out the idea of good, tasteful, but moderate-cost interior fittings, as part VI does that of good planning and well proportioned exteriors, the whole scheme being to furnish suggestions for building a good comfortable home, after a well thought out plan and within the limits of a moderate purse. They are published in paper, portfolio, at the cost of $1 each.

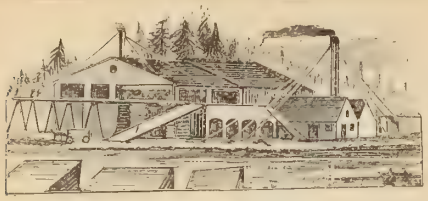
THE *Southern Lumberman* being asked its sentiment regarding the admission of Canadian lumber into the United States, says:—"We favor a tariff on all lumber or timber brought into our ports, except such woods as do not grow in the United States. When we say tariff, we don't mean a tariff for revenue only, but a *protective*, or if you please a *prohibitory* tariff. We don't want any money sent from our country to pay for any kind of timber or lumber that we have for sale ourselves." Our contemporary very courteously acknowledges its selfishness, and when we reflect on the amount of grumbling that is going on among the trade across the lines because the Canadian Government has seen fit to protect our people against the slaughter of our forests in favor of the Americans, we cannot help but think that the average Yankee is indeed *very* selfish. Canadians don't grumble because the Americans choose to adopt a prohibitory tariff, on the other hand we rather like it, and consider that what's sauce for the goose is sauce for the gander. We propose to make our cousins *pay* for the woods that do not grow in the United States. We hold the trump card.

THE SPANISH BAY TIMBER.

A LANDLOOKER who has lately been examining some of the Spanish river timber, in the Georgian Bay region of Ontario, reports, on his return, that the pine he saw there is not of a very high average grade. It will run but a low percentage to uppers, but makes common of excellent quality, free from black knots and shakes. The country he describes as well drained, but with streams that are ill-adapted to the driving of logs. In consequence, logging is much more expensive than the average of such work in Michigan and W[illegible] rails have to be shifted. Creosoted elm and birch did well, and are to be recommended. Chestnut was unfortunately not included in the experiment, although it is considered one of the best woods for ties. The behavior of the catalpa was one of the most interesting features of the case, all [illegible] wood being sound, except just under the rails, where they are crushed nearly to a pulp.

THE intention of the new Administration of Quebec to increase the provincial revenue at the expense of the lumbermen is one of most serious consequence for the trade in Quebec. Hitherto that Province has been disposed to foster rather than to discourage its greatest industry, so that the new policy is as startling as it is ill-advised. Even as an expedient for augmenting the revenue, Mr. Mercier may find that he has made a false calculation in adopting this step. For the moment it may raise the receipts, but in the long run the effect may be the very contrary. Such an enormous increase in the ground rents as that from $2 to $5, must have a crushing effect upon the industry. If so it would be the old story of killing the goose that laid the golden eggs. If the business is rendered stagnant the receipts of rents, &c., may fall off instead of increase. Limits placed in the market would find bidders shy of property depreciated not only by heavy additional burden imposed upon it, but also by the uncertainty whether there might not be another sudden turn of the screw. And the depression and impoverishment of a great industry cannot have its baleful effects confined to those who have their capital invested in it. The vast army of men employed would also share in the loss and indeed its influence would pervade the whole community. It is to be hoped that the Quebec Ministry will yet reconsider a decision which must be so injurious if carried out.

As has been previously stated in THE LUMBERMAN it is quite probable that a still higher export duty on Canadian logs will be imposed during the present session of the Dominion Parliament. The lumbermen are asking for the change, in order to more fully diminish the shipments of forest produce in its unmanufactured state. It is to the interest of not only the lumber trade but the public in general, that whatever of our forest products finds a market in the United States, or any other country, should be sent in the shape of sawn lumber, thus securing additional employment for Canadians. Our American contemporary, the *Northwestern Lu[illegible]*, thinks that the policy of the Dominion Government in regard to the export duty is of doubtful wisdom, for the reason, as it says, that it has the effect of checking the movement of Canadian logs to Lake Huron mills, on the American side, that had begun to assume important proportions. We are also called upon to reflect that "but for American enterprise and capital the lumber industry of Algoma and Muskoka would be of slow growth." We would remind our contemporary that Canadians are not as anxious to have their forest wealth slaughtered as it seems to imagine. Our object is to *protect* our forests as much as possible, so that in future years we will, unlike our cousins across the border, have something to fall back on. No attempt has been made to prevent Americans from cutting timber in this country, but when this privilege has been allowed we claim that i should be manufactured here also, or the alternative of a high export duty. Canadian lumbermen are sufficiently wide awake and have the capital necessary to do full justice to the lumber trade of Canada, but at the same time a welcome is extended to any outsider to open out operations here, provided they will comply with the just demands laid down by our government. It may fairly be open to question whether even it is advisable that we should export considerable quantities of saw logs or lumber to the States, seeing that in a very few years we may need all that we can produce for our own use. If Americans complain so bitterly now about the duty on saw logs, what would be the result were our government to further restrict the output of forest productions, by putting an export duty on sawn lumber also? In consideration of the fact that Americans are so eager for our fish, forests, minerals, coal and other natural products we would suggest that they forsake that God-forsaken country, emigrate to Canada, and take the oath "For Queen and Country.'



The Canada Lumberman

DEVOTED TO THE LUMBER AND WOOD WORKING INTERESTS OF THE DOMINION.

TRADE REVIEW.

TORONTO.

Trade, which for some time back was rather quiet, seems to have greatly improved, with fair prospects of being good, provided no untoward circumstances occur. There is a scarcity of 18 and 20 feet joists, both 2x8 and 2x10., few, if any yards, have enough to fill an ordinary bill. Mill cull boards are fetching better prices than usual. The Grand Trunk, R.R. has issued a circular to lumbermen notifying them that on and after May 1st, rent will be charged for piling ground at the rate of 5c. per M. ft. for each week or any part thereof. This is a move in the right direction.

The following are the ruling quotations in this city at present:–

Mill cull boards &scantling..$10 00	Dressing stocks.....16 00@18 00
Shipping cull boards, promiscuous widths..... 12 00	Picks Am. inspection..... 30 00
" stocks 13 00	Three uppers, Am. inspection 40 00
Scantling and joist, up to 16 ft 13 00	B. M.
" " " 18 ft 14 00	1½-in flooring, dressed 25 00@30 00
" " " 20 ft 15 00	1¼ " " rough .14 00@15 00
" " " 22 ft 16 00	1¼ " " dressed 23 00@25 00
" " " 24 ft 17 00	" " undressed ... 14 00
" " " 26 ft 18 00	" " dressed 16 00@20 00
" " " 28 ft 19 00	" " undres'd 12 00@14 00
" " " 30 ft 20 00	½Beaded Sheeting, dressed ..... 18 00@20 00
" " " 32 ft 21 00	Clapboarding, dressed.. 12 50

" boards " 20 00	Cherry, No. 1 & 2 ...50 00@60 00
	Whiteash 1 & 2.....25 00@30 00
	Black ash 1 & 2.....20 00@25 00

HAMILTON.

APRIL, 25th, 1887.

There is nothing of any importance to note from this market. Prices are firm and bill stuff is in good demand.. Considerable difficulty is experienced in obtaining long bill stuff.

The following are the ruling prices in the retail yards:

Mill cull boards and scantlings .....$ 9 00 to $10 00	1¼ flooring, rough. 16 00 to 18 60
Shipping cull boards, promiscuous widths..... 10 00 to 12 00	1¼ flooring, ro gn. 16 00 to 18 00
Shipping cull stocks 13 00	1¼ flooring, dressed face measure ... 32 00
Scantling and joist up to 6ft..... 13 00	1¼ flooring dressed face measure ... 25 00
Scantling and joist up to 18ft..... 13 50	1 flooring dressed face measure ... 23 00
Scantling and joist up to 20ft 14 00	Beed sheeting 1,.. 28 00 to 30 00
Scantling and joist up to 22ft..... 15 00	Picks A M. Inspection..... 30 00
Scantling and joist up to 24ft..... 16 00	Three Uppers A. M. Inspection..... 40 00
Scantling and joist up to 26ft ... 17 00	XXX sawn shingles per M..... ... 2 60 to 2 70
Scantling and joist up to 28ft ... 18 00	Sawn Lath 2 25
Scantling and joist up to 30ft 10 00	Red oak..... 20 00 to 25 00
Cutting up plank 1¼ and thicker, dry 20 00 to 25 00	White oak..... 25 00 to 30 00
Cutting up boards 20 00	Basswood No. 1 and 2 ..... 18 00 to 20 00
Dressing stocks... 16 00 to 18 00	Cherry No. 1 and 2 50 00 to 60 00
	White Ash No. 1 and 2..... 25 00 to 30 00
	Black Ash No. 1 and 2..... 20 00 to 25 00

MONTREAL LUMBER MARKET.

MONTREAL, April 25th, 1887.

During the early part of this month, business in the lumber trade was very quiet, a condition of affairs which was due principally to the rough weather, and bad condition of the country roads which prevented farmers and others from drawing their supplies. The movement altogether was very light, and quite a decrease in business could be noted in comparison with the corresponding period of last year.

Latterly, however, a distinct improvement has taken place, and we have to report a fairly active trade; still, the business done does not show an increase over last April. The demand at the yards has been rather brisk, but not much has been done in carloads. Late advices from mill owners do not give much hope for higher prices this summer, although the cut has been much less than last year's, prices therefore remain steady. Dealers here confidently expect by the middle of next month to turn over a good many carload lots. The delivery in the city has been considerably interfered with the last few days, owing to the inundation of the lower part of the city. There is a bright outlook in the building line for this season. Among the more prominent buildings to be constructed being the magnificent stations of the Grand Trunk and Canadian Pacific Railway.

The following are the quotations of the yards here:—

Pine, 1st quality, ₱ M $00 00@40 00	Bass, run of log culls out, ₱ M..... .....$18 00@20 00
Pine 2nd " " 00 00@30 00	Oak, ₱ M..... 40 00@50 00
Pine, shipping culls, ₱ M..... ..... 14 00@16 00	Walnut ₱ M 60 00 100 00
Pine 4th quality deals ₱ M..... 10 00@12 00	Cherry, ₱ M 80 00 100 00
Pine, mill culls, ₱ M. 8 00@10 00	Butternut, ₱ M..... 35 00@40 00
Spruce, ₱ M ..... 10 00@13 00	Birch, ₱ M..... 20 00@25 00
Hemlock, ₱ M..... 9 00@10 00	Hard Maple, ₱ M.... 25 00@30 00
Ash, run of log culls out, ₱ M..... 20 00@25 00	Lath, ₱ M..... ... 1 50@ 0 00
	Shingles, 1st, ₱ M... 2 00@ 3 00

THE AGE OF TREES.

Evidence as to the age of trees always requires careful examination. The *Lumber Trade Journal* says that many surveyors and lawyers know that the concentric rings are not to be taken as evidence of the lapse of time, and it gives the following as the result of an examination of pieces of wood from trees the age of which was known: Big hickory 11 years old showed 16 rings; green ash, 8 years, 11 rings; Ky. coffee tree, 10 years, 14 rings; Burr oak, 10 years, 24 rings; chestnut, 4 years, 7 rings; peach, 8 years, 6 rings; chestnut oak, 24 years, 18 rings.

MARITIME NOTES.

THE leading topic of conversation in mercantile circles is, of course, the Stewart failure, and the Maritime Bank suspension; the failure of Mr. S. Schofield, before, and the assignment of Mr. Geo. MacLeod, after the Bank break up, have been allowed to, as it were, drop out of sight. When compared with the overshadowing proportions of the smash up which has, I am afraid brought sorrow to many homes.

It is all very well, this lending money to one large house, but I cannot help thinking it savors too much of the plan of having all one's eggs in one basket, which is not good policy; of course it is all right as long as things go smoothly but let a pressure come, and then where are you? Report is very busy about some of the proceedings between the bankrupt firm and the closed bank, and at the meeting of the shareholders of the institution to be held shortly, some highly interesting developments will probably be reached.

* * *

Our great business is, of course, lumber, and as everybody knows, lumber has been an unprofitable article to handle for the last five years, and the reports so far from the English markets are not encouraging, although the stock there is light, and the cut here, not within thirty per cent. of that of last year; still this does not seem to have the effect of raising the prices in the trans-atlantic markets.

A number of our people have tried to make out that our local government charges too much stumpage on lumber cut on Crown Lands, and that that is the main reason why our shipments have decreased in quantity and our returns therefrom become so unremunerative. I cannot agree with this idea, for while I am of the opinion that our Government stumpage ($1.25 per thousand feet) is very high, still the opponents of this charge do not go far enough away and consequently do not see the real obstacle to our obtaining good prices for our lumber. They forget that the Baltic ports are very much nearer the English and Continental markets than we are, that their wood answers for all ordinary purposes, equally well with our spruce, and that there is a difference in freight alone of more than one pound sterling per standard or nearly two dollars and a half per thousand feet in favor of the Baltic ports, without taking into account the fact that labor is much cheaper with them than with us.

* * *

The American market is opening up very well this spring, and if the carpenters and other laborers can be induced to settle their little difficulties with their employers without having recourse to the lamentable strike, there seems to be a fair prospect for remunerative returns on wood goods shipped this season to United States ports.

There is one very important factor in the success or failure of our American shipments this season, and that is the action of the Dominion Government towards the American fishermen. So much has been said and written about this matter that it is not worth while for me to go into the question—I can give my opinion in a very few words—Canada is right to insist on the recognition of the three mile limit, but she is decidedly wrong to harass the American fishermen in the numberless petty ways that we see used last season. The result of such conduct will be that the Retaliation Bill will be put in force, which will simply mean almost ruin to these lower provinces, and will do more to further the fast growing feeling of secession, not to say annexation, that is spreading over the Atlantic portion of this country than anything else that could possibly happen. The interests of the Lower Provinces are very closely interwoven, much more so than with Upper Canada, despite our political union, and we, in this part of the country, cannot afford to quarrel with the United States no matter what the magnates at Ottawa may think.

CHIP.

OTTAWA LETTER.

OTTAWA, April 25th, 1887.

[*From our own Correspondent.*]

THE month is fast merging towards a close, and yet comparatively speaking everything wears a wintry aspect as far as the mill work at the Chaudiere is concerned. Everything to be sure is in preparation for opening the season's campaign, but the ice on the Ottawa is firm and as yet shows no signs of making a move. From all appearances this spring is going to be a repetition of the year 1876, the year so late in opening and so well remembered for its remarkable high water in the Grand River. This winter just past has been one exceptionally severe, and its effects on the log cut has been more or less marked. The great depth of the snow in many localities was remarkable, and jobbers who had signed contracts were put to a great deal of extra expense on this account. The main roads could readily enough be kept in order, but in the bush and on the roads to the railways the snow was of such prodigious depth and fell so frequently that in many cases as many as five snowplows were detailed to each team to make a passage for the logs out to the main road. Of course this meant very large expense, so that the output of logs was not only attended with difficulty, but also with a heavy outlay in the matter of labor. Horse labor was high and men's wages were on the whole good, and many more were employed than had the winter been of the ordinary kind. One effect the heavy snowfall had, however, and that was that the logs got out this year are of a better quality than those of the previous year. They were so hard to be got out that the log makers got directions to make none but those of the best quality. In many quarters in the Ottawa region drawing is yet in full blast, notably on the Upper Dumoine and Gatineau where Hamilton Bros.' men are still drawing logs to the ice and those engaged say the sleighing is of an excellent kind.

RIVER IMPROVEMENTS.

The Government have been active in making all due repairs to slides, booms and piers on the Ottawa and its tributaries. The south slide at the Chaudiere has been repaired and a new apron put in. The booms, slides and piers at the Petewawa, Dumoine, Madawaska, Magnissippi, Bonnechere, Black, Colounge, and Gatineau rivers have been strengthened as well as the slides at Des Joachim, Portage-du-Fort and Calumet. The Upper Ottawa Towing Company have issued their tariff. They have built a splendid new iron tug at Pembroke for towing operations on the lower Allumette lake, which was a want badly felt, and will greatly facilitate the transit of logs from the Upper Ottawa region. The tow will be managed between Des Joachine rapids and the head of Allumette rapids by the tugs "Hiram Robinson" and "Bronson" and the powerful steamer "C. O'Kelly."

THE CUT.

The sawlog cut is variously estimated between 600,000,000 and 700,000,000 feet, but the best informed say the former. The square timber cut is away down low, white pine 530,000 feet, waney white pine 355,000 feet, red pine 485,000 feet. This does not include some 14,000 pieces made and drawn to French River on the Georgian Bay. Besides the above Mr. R. White has 170,000 feet of white pine on Black River, stuck since last year, which he confidently expects to get to the market this season. He confined his operations this year to saw logs.

The Americans who have penetrated to the Nipissing and Georgian Bay districts, have not been idle this winter. With an eye to the main chance they have secured some of the finest limits in the localities named, and it is computed that 75,000 standards of logs will cross the lakes to the American mills—Canadian logs to be manufactured by American saws. Many of the Canadian dealers think that the export duty on logs leaving Canadian territory should be increased. Canadian shippers have to pay full rates to the United States government when shipping manufactured lumber, whereas these American saw log shippers get off comparatively scott free. This is claimed to be an injustice to the Canadian dealers as the competition is not equalized.

A HIGHER GROUND RENT.

The Mercier Government in the Province of Quebec propose raising the ground rents on timber limits in the Province of Quebec from $2 to $5 per square mile, and the limit holders in this locality feel quite wrathy over the proposal. The Quebec treasury is dry and a shift is made to fill the empty chest in this way. As there is some 47,000 square miles of limits taken up the revenue would be considerably augmented by the proposed increase. The lumbermen held a meeting here a few days ago and discussed the matter in all its moods and tenses. They think a great injustice is contemplated, and they propose making their grievances known to Mr. Mercier at an early date. A meeting will be held in Montreal in a few days when the protest will be formulated.

Bradstreet's, the weekly financial and commercial newspaper published by The Bradstreet Company, is now in its fifteenth volume, and is surpassed by none of the financial and commercial periodicals of this country or in Europe. In the fourteen volumns already issued can be found a greater diversity of original and carefully prepared matter—facts and figures—relating to business topics than in any other periodical during the same period. Nor is it surprising that it has reached and maintains this position, for it is owned and published by a large corporation—with its cash capital and assets of over $1,400,000, its nearly 100 branch offices, and its small army of over 1,600 salaried employes and 65,000 regular correspondents. This organization makes extensive investigations into industrial and other matters, gathers full reports of the condition and prospects of the leading crops, and reports regularly each week the condition of trade throughout the country, thus practically making *Bradstreet's* an authority as to the condition and prospects of the commercial world. It needs but a glance at the newspaper to satisfy any one that its publishers have been ambitious rather than avaricious. Files of *Bradstreet's* have become an acceptable and almost indispensable journal for progressive business men.

THE SPANISH BAY TIMBER.

A LANDLOOKER who has lately been examining some of the Spanish river timber, in the Georgian Bay region of Ontario, reports, on his return, that the pine he there is not of a very high average grade. It will run but a low percentage to uppers, but makes common of excellent quality, free from black knots and shakes. The country he describes as well drained, but with streams that are ill-adapted the driving of logs. In consequence, logging is much more expensive than the average of such work in Michigan and Wisconsin. There are but few improvements for facilitating work as yet, and though they will come after a while, it will be some time before they are available. Considerable purchases of timber have been made in that district by lumber manufacturers on this side, but it is not determined yet whether they are going to be immediately profitable. The way the pine supply on this side is shrinking, there is hardly any question but that anything in the way a tree belonging to this species that will make a saw log will be worth a proportionate part of its weight in gold within a very few years. Those who have dipped into Georgian Bay timber and the impression that they were buying Cass river pine, if there are any such, have doubtless some disappointing truths to learn regarding the quality of their purchases; but even they, and probably all others who have bought there, will be likely to see their money with good interest out of the property. The imposition of extra duty on unmanufactured timber has been a drawback to the owners of Canadian pine, and the possible retalatory measures on the part of the United States against the Dominion government may prove another, though the latter is not likely to amount to anything serious. The business relations of the two countries are too close and intimate to admit of much official foolishness, or of a little long continuing.—*Chicago Timberman.*

MR. MEREDITH'S REQUEST.

THE Toronto *World* editorially remarks: The request recently made by Mr. Meredith of the Commissioner of Crown Lands that the Government would prepare a map showing, in colors, the timber limits now under license and the area remaining undisposed of, was a reasonable one. The information would be extremely useful as a guide to legislators, lumbermen, and all others interested in knowing the condition and extent of our available timber resources. The Government ought to have the facts at hand or readily accessible, and the public have the right to the information. We cannot but think that Mr. Pardee's estimate of the cost of preparing such a map at $10,000 is a considerable over-statement, but even if it were approximately correct it might be worth the money to give the law-makers and the public a correct idea of how much of the resources on which the Province depends for future revenue is still intact. Our forest wealth should be husbanded with the greatest care. As has often been said, in using the revenue derived from timber sales to pay the current expenses of government, we are really living on our capital. When the forests are exhausted we shall be forced to resort to direct taxation. It is time that the whole question of provincial finances was reconsidered, with the object of ascertaining how long we can depend upon the crown lands as our main source of revenue, and whether some steps cannot be taken to capitalize at least a portion of our receipts from this source, so as to secure a permanent income when the timber is exhausted.

London, Eng, Timber.—We are glad to be able to report that the trade at last shows some signs of returning amination after the long spell of dulness and inactivity which have characterized it for so many months past. We have reported for a few months past a somewhat improved tone in the public sales, with more briskness and confidence on the bidding, which has kept prices very firm. This improvement appears to gain strength as the spring advances, and the sales held this week have shown not only continued firmness, but in some instances an advance in prices. By general consent the demand since the commencement of the month has shown a gratifying increase, which is confirmed by the very satisfactory dock deliveries for the week, which it will be seen total up to 4,513 stds. of deals, battens and boards, against 3,942 last year. These deliveries are all the more satisfactory as the dock stock is small, and they have not been unduly stimulated by heavy public sales without reserve, but represent an ordinary quiet week's consumption, and judged by this standard must be of good omen for the future. The deliveries may fluctuate week by week, but we think the tendency will be to an improvement over last year. Is is to be hoped that the shipments next season may again be on a reduced scale as, even taking a favorable view, our market will be hardly in a position to absorb an excessive quantity of stuff. It will take some time for the trade to recover from the weakening it has experienced during the past few years.

TENDERS

SEALED TENDERS, marked "For Mounted Police Provisions and Light Supplies," and addressed to the Honourable the President of the Privy Council, Ottawa, will be received up to noon on Monday, May 30th, 1887.

Printed forms of tenders, containing full information as to the article and approximate quantities required, may be had on application at any of the Mounted Police Posts in the North-West, or at the office of the undersigned.

No tender will be received unless made on such printed forms.

The lowest or any tender not necessarily accepted.

Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to 10 per cent. of the total value of the articles tendered for, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to newspapers inserting this advertisement without authority having been first obtained.

FRED WHITE,
Comptroller N. W. M. Police.

Ottawa, March 25th, 1887. 2d86

CANADA AND WEST INDIES.

TENDERS FOR STEAMSHIP LINES.

TENDERS will be received at the Finance Department, Ottawa, up to and including the 1st day of May next, from persons or companies, for the performance of the following steamship services, viz:—

1st, a line of mail steamers sailing from Halifax to Havana, thence to Kingston, thence to Santiago de Cuba, thence to Canada; and (2nd) a line of mail steamers between Canada and Porto Rico and adjacent islands. Trips to be made by each line fortnightly. Steamers to be of a size sufficient to carry 2,000 tons of cargo, and to be able to steam twelve knots an hour, averaging not less than eleven knots an hour. The contract in either case to be for a period of five years. Tenders will be received for the above services either separately or together. Tenders to be marked on the outside "Tenders for Steamship Service to West Indies." The Government of Canada do not bind themselves to accept any tender.

By command,

J. M. COURTNEY,
Deputy Minister of Finance.

Finance Department,
Ottawa, 7th Feb., 1887.

BY STRAIGHT MEASURE OR INSPECTION.

THIS is just now a live question in the lumber trade, and especialty a certain portion of it whose operations are mainly carried on in the producing regions, and at the distributing markets, of the lower lakes. There it has become a declared issue between a majority of the buyers and a certain proportion of the sellers; and if present indications may be relied upon, there is likely to be a lively and interesting struggle between the two when the season is fairly opened.

Concerning the merits of the controversy, there ought to be less dispute than as to its practical result. Presented merely as an abstract question, the answer to it is easy, simple, and measurably conclusive. The buyer of lumber, in common with the buyer of any other bulk commodity, the quality and value of which is uncertain and impossible of accurate determination by a mere casual examination, is entitled to some other and adequate means of knowing what he is to get for his money. The basis of any wholesale trade in lumber is the quality of the stock handled. It is this which establishes the price, and determines the sale, if a sale is made. Without knowledge of this factor of the transaction, no man can buy intelligently. It is an essential feature of a purchase from both sides. If the owner of stock should fail to acquaint himself with its actual merits or defects before he went into market with it, how long could he expect to do business successfully? It is beyond question equally necessary for the other party to a trade to know what he is buying.

Granting that this knowledge is a thing the purchaser is entitled to, it becomes merely a question of how he is to obtain it. Obviously the simplest, and perhaps the best way, is for him to examine what he proposes to buy himself. This is the method of small transactions, the first crude plan of determining values that suggested itself when trading between men began. So long as the business done is confined to transactions of a small magnitude, it is satisfactory, because the buyer only invests in what his judgment approves, and even if he fails to get the worth of his money, may not realize the fact. But it will be admitted without argument that the same plan cannot be applied to business done on a larger scale, and give equally satisfactory results. A man buying a wagon-load, or even a car-load, of lumber may examine it for himself and decide upon the evidence of his own eyesight and judgment as to what it is worth; when he buys a million feet, this becomes to all intents and purposes physically impossible. What can he do? Clearly he must be allowed some way of ascertaining what the stuff is, and practically but two remain open to him: he may accept the representations of the seller, or he may buy it subject to an examination by a competent, disinterested man—that is, inspection.

The necessity for inspection arose just as soon as men began to deal upon a large scale in bulk commodities, and in the process of commercial development it has come to be a part of the machinery of business in every line in which the nature of the merchandise handled makes expert examination necessary.

Lumber is certainly such an article. It is handled in bulk, and it is subject to wide variations in quality and worth. Any average lot of log run lumber will range in quality from mill culls to first clear, and hardly any two piles will show precisely the same proportion of the respective kinds and grades into which it is ordinarily assorted. One board furnishes no definite guide as to what the next one in the pile will prove to be; indeed, one cannot tell from it what will be the quality of the succeeding cut from the same log. As a matter of absolute fact, no two piles of lumber, or two logs, or even two boards, are exactly alike. The difference may be so slight as to be of no commercial account, or they may be so great as to make one piece of lumber valueless, and the other worth the highest price the market shows; between the two extremes the variations are infinite in number. An average of these differences may be obtained by assorting the lumber into grades: according to a definite system, and from such an average it is easy to determine the value of the whole. This is merely what inspection is for, and what, honestly made, it does.

Inspection, pure and simple, means nothing more or less than an examination of the stock to see what it really is. It is or should be, within the right of the buyer to have this knowledge, without which he must be compelled to take all the chances in a trade, while the seller takes none. It is to be presumed, in all cases, that the seller knows what he is offering. If he does not, it is his own fault. But the buyer cannot know unless he is allowed to ascertain, and this privilege the straight measure advocates seem disposed to deny him. Men may prefer to buy on their own judgment of lumber, because they think their own judgment may be better than any inspector's, which very likely it is; but this does not furnish a reason why another buyer should not have his lumber inspected Fairness would dictate that manufacturers should give their customers the same opportunity to test the value of what they sell, as they require in buying the raw material they manufacture. They, or some of them—insist that a buyer shall judge of the quality of a pile of lumber by looking at the top and sides, with no chance to plunge into the middle of it, and to find out of what stuff it is really made; but where is the maker of boards who would think of buying his timber in the same uncertain, haphazard way? Would one of the Saginaw mill men, for example, consent to skirt around the edges of a thousand-acre tract of pine, and then buy it 'straight measure'? No; when he buys timber, he must have it inspected, and inspected, not by a disinterested man, but by a land-looker of his own selection and employment, who is instructed to carefully examine every acre, to scale the trees, and to ascertain beyond a doubt just what the timber is that he is asked to purchase. If there is any good and sufficient reason why a principle that is obviously just when applied to timber standing in the tree, is not similarly fair and righteous when applied to the same timber after it is cut into lumber, the discussion of inspection and straight measure has so far failed to bring it out.

The exceptions of the manufacturers to a one sided and unfair inspection by interested parties are well taken. Equally with the buyers, are they entitled to a competent and unbiased judgment of their stock; and it is manifestly to the interest of buyers that they should have it. But there should be a remedy for an evil of this kind short of abolishing inspection altogether. It is not to be assumed that buyers will insist upon inspectors of their own choosing. Indeed, they have distinctly expressed the desire that manufacturers should "organize and appoint a corps of qualified and reliable inspectors," and should themselves establish a just and fair system of inspection. This places the matter wholly in the seller's hands, and affords them the opportunity of giving inspection a trial upon an equitable basis, if they are disposed to do so.

The actual outcome of the inspection dispute, depends of course, upon other circumstances than the mere principle involved. For the time being, the condition of the market will probably have more to do with it than abstract right or wrong. With a strong, active demand and firm prices, the manufacturers will be likely to dictate the manner in which they will sell their lumber; with a sluggish, weak market, probably buyers can have all the inspection they want. This is not right, but perhaps it is "business.—*Chicago Timberman.*

THE LUMBER TARIFF.

WE have been shown a copy of the C.P.R. special lumber tariff from Rogers' Pass to all points east as far as Winnipeg. The following are some samples of the rates:—

MILES	TO	RATE per 100 lbs.	RATE per car
136	Banff	32c	$ 96
216	Calgary	39c	1 17
270	Gleichen	40c	1 20
657	Moose Jaw	40c	1 20
699	Regina	42c	1 26
923	Brandon	44c	1 32
1055	Winnipeg	45c	1 35

The first fact that will be recognized in scanning these figures is that the rates are a practical preventative of any business in lumber between the prairie towns and the mountain saw mills. It is therefore useless to go into an analysis of the unfairness of the figures as between one point and another, because the tariff is evidently not intended to foster freights but to check and prohibit them for the time being altogether. To say that a railway is seeking to discourage business over its own line appears on the face of it to be absurd, but a little scrutiny of the situation will show that there are reasons. Under the comparatively low tariff allowed last year the lumber mills in the mountains west of Rogers' Pass were able to do a prosperous business, and in view of a continuation of that tariff, they greatly increased their capacity for manufacturing. The railway was fostering their enterprise, but, as the sequel shows, they were fostering it with a view to make food for their own capacity. The company foresaw that they would require vast quantities of lumber and sawn timber for their snow sheds and other works in the mountains. The mills have been put in, the railway puts on a freight tariff that prevents them entering the markets, and at once the C.P.R. is master of the situation. They can dictate to the mill owners in the mountains the price and terms on which they must supply the lumber and timber the railway needs, and that price and those terms will just squeeze the mill owners hard enough to get all that can be got out of them without actually killing them.

The practical shutting out of these mountain mills from competition with Maj. Walker, at Kananaskis, and the Calgary Lumber company, at Cochrane, will be a good thing for those mills temporarily, but what assurance is there that the C.P.R. will not some time require to use them just as the mountain mills are now being used? The effect is to demoralize business, to destroy confidence, and check and prostrate enterprise.—*Calgary Tribune.*

CHARCOAL.

AN exchange desires to know why charcoal is not more largely used for fuel in Ontario. In France it is in general use for cooking and even, in some cases, for warming, though wood is very much dearer than in Canada. But in some other European countries, every scrap of waste wood is converted into charcoal.

In Canada we have hardly begun to realize the value of our forests. A few years only have passed since the finest forest trees were regarded as cumberers of the ground, and the one object was to cut them down and burn them. Now we realize the value of most trees fit for lumber; but even with these the waste is enormous. The limbs are worse than lost they are left to dry upon the ground where the trees are cut, and when fire gets among them it spreads rapidly and works incalculable damage. Most industrial operations are conducted with such economy that the waste products constitute in themselves a large source of profit. It might be so in lumbering camps. The waste wood might be turned into charcoal for fuel, and in the process the pyroligneous acid and other products might be saved, so that the charcoal would be had for nothing. Mineral coal is raised from great depths, and is carried great distances. Charcoal might be had in almost inexhaustible quantities much nearer the Canadian cities, and would prove a source of great wealth. A pound of charcoal will produce more heat than a pound of the best mineral coal. A table which we found in the Encyclopedia Britannica says that one pound of mineral coal will evaporate water as follows:

COAL.	WATER, LBS.
South Wales (average)	9.05
North of England	8.37
Lancashire	7.94
Scotland	7.70
Derbyshire	7.58

One pound of charcoal will evaporate 12.75 pounds of water. In all cases the evaporation is that of water already raised to the boiling point. It will be seen that charcoal has one-third more heating power than the best Welsh coal, and 65 per cent. more than Scotch coal.

Doubtless difficulty would be experienced in using charcoal for heating; but we cannot doubt that Canadian ingenuity would soon find means to employ it with comfort and safety. For cooking, especially in summer time, charcoal has many advantages.

The sawdust, which not only goes to waste at saw mills, but which gives so much trouble, is to be used for a good purpose. The *Journal of Commerce* says:

It is understood that a company is about to be formed in Ottawa with a large capital for the purpose of purchasing a water power on the Chaudiere and erecting extensive mills for the manufacture of pulp from the sawdust, which has for so long been a nuisance to both lumbermen and forwarders in the Ottawa river. Mr. Bronson, M.P.P., is one of the principal promoters of the scheme.

If the sawdust can be made of economic value, surely the limbs of trees should not be permitted to go wholly to waste, and that at a time when mineral coal is getting more and more expensive. At present Ontario is wholly dependent upon foreign countries for coal. If her own forests were turned to the best account, employment would be found for many laborers, freights would be supplied to Canadian railways, and large sums of money now sent abroad would be retained at home.—*Exchange.*

TIMBER AND LUMBER NOTES.

At Beaverston, on the north shore of the Georgian Bay, Burton Bros. are getting out some seventy-five or eighty thousand feet of board timber and five or six million feet in saw logs. At Collins Inlet the Collins Inlet Lumbering Company will have out five and a half million feet in saw logs. All along the North Shore there will be an unusually large out-put of logs this year, so says the *Expositor.*

The Port Perry *Standard* says:—Last Tuesday we beheld one of the largest saw logs that has ever been seen in this part of the country. The tree from which it was taken grew on Mr. John T. Pound's farm just north of this village, and was blown down about three years ago during a heavy wind storm. The first two logs cut from the tree measured fifteen feet each in circumference and were composed of good, sound, clean, timber. They were taken to Utica to be cut into shingles.

According to a despatch from Ottawa, the lumbermen of that neighborhood have met to discuss the bill introduced by Mr. Murray, M.P.P., before the Ontario Legislature. They almost all pronounce against the clause providing that in case of a jam of timber or logs on any stream where a number of lumbermen's logs are congregated, the firm or individual who breaks the jam may take a lien on the logs so liberated until paid for the expense of freeing them. The lumbermen object that this provision, if adopted, would result in endless litigation.

WORKING CLASSES ATTENTION

We are now prepared to furnish all classes with employment at home, the whole of the time, or for their spare moments. Business new, light and profitable. Persons of either sex easily earn from 50 cents to $5.00 per evening, and a proportional sum by devoting all their time to the business. Boys and girls earn nearly as much as men. That all who see this may send their address, and test the business, we make this offer. To such as are not well satisfied we will send one dollar to pay for the trouble of writing. Full particulars and outfit free. Address GEORGE STINSON & Co., Portland, Maine.

SMITH'S

Mercantile & Land Reporting Agency

BANKERS—DOMINION BANK.

General Solicitor, JNO. LEYS, ESQ., Barrister, Toronto. Secretary, JOHN SMILEY, M.A.

MANAGER—WILLIAM SMITH.

General Offices—Court St., Toronto, Ont.

Telegraph Address—Agency, Toronto.

Having for its special objects the furnishing to subscribers of reliable information on the financial standing or otherwise of tradesmen and others, the collection of outstanding accounts and the procuring of the most reliable information from independent sources of the value and condition of landed and other properties in any part of Canada and the United States, with correspondents in Great Britain and other parts of Europe.

Our method of procuring for our subscribers the most reliable information is through solicitors of the highest standing, and from other equally reliable sources in the several localities indicated, who are under contract with us to supply the necessary information promptly.

The Landed Enquiry Department of this Agency, the only institution of this kind known, is invaluable to Solicitors, Loan, Investment, and Insurance Companies, Estate Agents, and others, preventing fraudulent land transactions resulting from mi-representations.

The Department for the collection of outstanding accounts is conducted on an entire change of the system usually followed by Collecting Agencies, viz.:—Subscribers may have their collections paid either direct to themselves, or to the offices of the Agency, in which latter case remittances will be deposited to an account provided for that purpose, and immediately remitted to the parties to whom it is due, and will not be applied to any other purpose.

Another important feature in connection with this department is, that subscribers depositing accounts for collection will, if requested, be furnished with a Form of Script, on which will be entered the name of each debtor, the amount owing, and a full report of the prospects of collection, and providing that the receipts thereof be paid to bearer only, thus enabling subscribers to realize on their outstanding accounts.

The Agency will forward at least once in three months, or oftener if desired, a report and statement of all accounts in hand.

NOTE.—The offices of the Agency are open to the Solicitors and subscribers for reference to our numerous maps, atlases, directories and correspondence, and for the transaction of business with their clients and customers when in Toronto.
